PREFACE

The feature of the year 1947 which most clearly emerges from the reports of events and progress in this issue of THE AMERICAN YEAR BOOK is that the world has embarked on an era of peace. This is not to say that peace has been achieved nor that peace is in immediate prospect in the sense of formal treaty making; it is to say that the world was preoccupied, in deadly earnest, in striving for peace in 1947. It must achieve peace if it is to survive.

The cleavage that exists between the conflicting ideologies of Russia and her satellites, on the one hand, and the Western democracies, on the other, now seems to be the chief stumbling block, yet the existence of such a cleavage is a ringing challenge to wise and patient statesmanship. Nowhere is the impact of this challenge more evident than in this country. It challenges us to defend ourselves should the necessity arise. It challenges us to temper our acute consciousness of the Atomic Age. It challenges our social and humanitarian awareness of the obligation to help a starving world and to defend the outermost ramparts of what we most believe in—the freedom, the dignity, and the general well-being of the individual. This is why the Marshall Plan looms so large in the 1947 report in this volume; it exemplifies all these things.

We are challenged, too, in our fiscal resources. Approximately 85 per cent of Federal expenditures in the fiscal year 1947 "directly reflected the costs of the war, the effects of war, and efforts to prevent a future war." (See "National Finance and the Public Debt.") It is estimated that these costs in 1948 will approximate 80 per cent, and, in 1949, 79 per cent. In his January 1948 budget message to Congress, President Truman stated that such a large proportion of expenditures "should be a sobering thought to all of us as we strive for lasting peace among the nations of the world."

Thus, the emphasis in the political, economic, and financial fields is on the necessity of striving for and achieving peace. Meanwhile, in the social, religious, and scientific fields, and in the humanities, this country has made substantial progress in working back to pre-war conditions and activities, in addition to taking care of current activities arising from new developments and certain old war burdens. The year 1947 was a year of severe trial and challenge; it was also a year of definite and steady progress, not always in the sense of forging ahead, but often in the sense of holding back threatened dangers such as those implicit in supply and demand of basic products, in the necessity for controlling prices and avoiding inflation, and in the ever present menace of want of balance in labor relations. These and the other factors recorded in this volume constitute the source material of our running history.

TABLE OF CONTENTS

PREFACE v
OFFICERS OF THE AMERICAN YEAR BOOK CORPORATION x
CONSTITUENT SOCIETIES AND SUPERVISORY BOARD xi
CONTRIBUTORS xv

PART ONE: POLITICAL—NATIONAL AND INTERNATIONAL

DIVISION PAGE

I. AMERICAN POLITICAL HISTORY 1
The President and His Policies.—National Personalities.—The Year in Congress.—The Supreme Court and Constitutional Law.—Federal Administrative Agencies.—Elections of 1947.

II. INTERNATIONAL AFFAIRS AFFECTING THE UNITED STATES . . . 75
The United Nations.—The United States and the Peace Treaties.—The United States and Europe.—Occupied Japan.—The United States and Latin America.—The United States and the Middle East.—Foreign Service of the United States.—Chronology of International Affairs.

PART TWO: AMERICAN GOVERNMENT

III. THE NATIONAL GOVERNMENT 147
Federal Administrative Organization.—Members of the Senate and House of Representatives.—Federal Judicial Organization.—Civil Service in the United States.

IV. STATE GOVERNMENT 168
State Administration and Legislation.—National and Interstate Relations of States.—State Constitutions, Referenda, and Initiatives.—Electoral Legislation.—County Government.

V. MUNICIPAL GOVERNMENT 199
New York City Affairs.—Municipal Political Trends.—Municipal Functions.

VI. TERRITORIES AND SPHERES OF AMERICAN INFLUENCE . . . 219
Alaska.—Hawaii.—Puerto Rico.—Virgin Islands of the United States.—Guam and American Samoa.—Trust Territory of the Pacific Islands.—District of Columbia.

TABLE OF CONTENTS

PART THREE: GOVERNMENT FUNCTIONS

DIVISION PAGE

VII. PUBLIC FINANCE AND TAXATION 242
National Finance and the Public Debt.—Municipal Finance.—Federal Income and Profits Taxes.—Land and Property Taxes.—Corporation and Bank Taxes.—Estate and Inheritance Taxes.—Automobile Taxes.

VIII. PUBLIC RESOURCES AND UTILITIES 273
Federal Surveys and Maps.—State Geological Surveys.—Reclamation and Irrigation.—Public Lands.—Public Utilities.—Water Supply.—Street and Highway Traffic.

IX. DEFENSE AND ARMAMENT 335
The United States Army.—Administration of Veterans Affairs.—The United States Navy.—Naval Construction and Equipment.—Waterways and Harbors.

PART FOUR: ECONOMICS AND BUSINESS

X. BUSINESS AND FINANCE 379
Economic and Business Conditions.—The Security and Money Markets.—Banking Affairs.—Trust Business.—Foreign Exchange.—Foreign Trade.—Foreign Trade Policies.—Public Accounting.—Life Insurance.—Fire Insurance.—Marine Insurance.—Casualty Insurance and Corporate Suretyship.

XI. AGRICULTURE AND ALLIED INDUSTRIES 462
Conditions in Agriculture.—Cotton, Grain and Other Field Crops.—The Dairy Industry.—Insect Pests and Plant Quarantines.—Fisheries.—Forestry.

XII. MINERAL INDUSTRIES 504
Gold, Silver and Platinum.—Iron and Steel.—Coal and Coke.—Non-Ferrous Metals.—Petroleum.

XIII. MANUFACTURES AND TRANSPORTATION 540
Conditions in Manufacturing.—The United States Tariff Commission.—Administration of Tariff Laws.—Railroads.—Highways.—The Motor Bus Industry.—Community Transit.—The Merchant Marine.—Commercial Aviation.

PART FIVE: SOCIAL CONDITIONS AND AIMS

XIV. POPULATION AND MIGRATION 589
Population Statistics.—American Indian Affairs.

XV. SOCIAL PROBLEMS AND CONDITIONS 604
Public Social Work and Welfare.—Private Social Work.—Housing Plans and Construction.—Prisons and Crime Control.

XVI. LABOR AND LABOR LEGISLATION 631
Labor Conditions and Legislation.—Employment and Unemployment Statistics.

TABLE OF CONTENTS

DIVISION PAGE

XVII. RELIGION AND RELIGIOUS ORGANIZATIONS 653
Interdenominational Activities.—Protestant Denominational Activities.—The Roman Catholic Church.—The Eastern Churches.—Judaism and Jewish Communal Affairs.

STATE OF THE UNION

In his address to Congress on the state of the Union, delivered Jan. 6, 1947, President Truman emphasized the need for harmony between Congress and the President in the conduct of international and domestic affairs. With respect to domestic economy, he pointed out that the country was in a very prosperous condition. He promised that remaining emergency controls exercised by the Federal Government during the war would be retained only so long as needed to protect the public. He urged industry to hold the line in existing prices and to make reductions whenever profits justified such action; and he likewise asked labor to refrain from pressing for unjustified wage increases that would force increases in the price level.

The President outlined five major economic policies which he believed the Government should pursue during 1947. These policies were: First, promotion of greater harmony between labor and management; second, restriction of monopoly and unfair business practices, assistance to small business, and the promotion of the free competitive system of private enterprise; third, continuation of an aggressive program of home construction; fourth, the balancing of the budget in the next fiscal year, and the achieving of a substantial surplus to be applied to the reduction of the public debt; fifth, protection of a fair level of return to farmers in post-war agriculture.

In connection with labor, the President condemned jurisdictional strikes, certain types of secondary boycotts, and the use of economic force, by either labor or management, to decide issues arising out of the interpretation of existing contracts. He urged the extension of the facilities within the Department of Labor for assisting collective bargaining, the broadening of the program of social legislation to alleviate the causes of workers' insecurity, and the appointment of a Temporary Joint Commission to inquire into the entire field of labor-management relations.

In the field of health and general welfare, the President recommended the establishment of a well-integrated Department of Welfare.

Referring to foreign affairs, President Truman reported that peace treaties for Italy, Bulgaria, Rumania, and Hungary had been prepared and would be submitted to the Senate for ratification. He said that we had made it clear that we would not retreat to isolationism. So far as differences between the United States and Soviet Russia were concerned, he said that our policy was guided by the same principles which determined our policies toward other nations: namely, to uphold the principles of international justice embodied in the Charter of the United Nations.

Expressing the opinion that the United States had not done its part in admitting displaced persons, the President asked Congress to turn its attention to this problem. He said we must take steps for the reconstruction of world trade as free from obstructions as possible.

Denying that the United States sought a monopoly of atomic energy, President Truman said we asked only that there be safeguards sufficient to insure that no nation would be able to use atomic power for military purposes. He looked to the Atomic Energy Commission to foster the development of atomic energy for industrial use and scientific and medical research.

In discussing military policy, the President stressed the need of well-equipped, well-trained forces, with a citizen reserve based on universal training. As one way to cut military costs and enhance the national security, he favored the establishment of a single Department of National Defense. Above national security, h placed collective security for all mankind as our goal.

ECONOMIC REPORT

The first Economic Report of th President to Congress under the Employment Act of 1946 was made b President Truman Jan. 7, 1947. H asserted that lower consumer prices avoidance of general wage increases and tranquility in labor-managemen relations were required if the countr was to continue enjoying its recor prosperity through 1947. He propose the continuation of taxes on wartim levels, extension of rent controls, increased social security benefits, highe statutory minimum wages, extensio of the wage-hour law to new group of workers, a long-range housing program, and labor controls—suggestion previously made in the State of th Union message. Other proposals included health, sickness and disabilit insurance, and a suggestion that part of social security costs b financed from general taxation.

Taking note of widespread fears o another depression, the President rejected the notion that we must hav one. He said that he had directed th Council of Economic Advisers an other appropriate government agencies to make a continuing study o the stabilization devices that migh become necessary and to recommen their being placed in operation i ample time to insure the anticipate effect. Among these devices he liste a well-integrated program of employment stabilization: improvements i the process by which workers fin jobs and employers find workers; improvements in the tax structure; wise management of the public debt; and a flexible credit policy.

PEAK PROSPERITY

In a special mid-year edition o his annual report to Congress on the economic welfare of the country issued July 21, President Truma traced the emergence from wartime controls and stated that production employment, and national income stood at peak levels. He asserted that the American economy was experiencing unprecedented prosperity but warned that the economic situation was being shored up by a backlog of pent-up demand from consumers, and that a number of basic economic adjustments must take place to forestall grave unemployment and costly business depression.

BUDGET MESSAGE

On Jan. 10, 1947, the President's Budget Message was presented to Congress. Estimating expenditures under existing and proposed legislation at $37,500,000,000 and revenues under existing laws at $37,700,000,000, President Truman recommended early action by Congress to continue the war excise-tax rates and an increase in postal rates sufficient to make up the postal deficit. He declared there was no justification for tax reduction.

In summarizing expenditures, the President pointed out that five items —interest on the national debt, tax refunds, national defense, international affairs, and veterans' service and benefits—totaled $29,200,000,000, or almost four-fifths of the Budget. Admitting that the period of large-scale general relief for our allies was almost over, he urged Congress to provide adequate support for the International Refugee Organization under the United Nations, and to authorize participation in the World Health Organization and the proposed International Trade Organization.

With the object of promoting social welfare, the President favored the creation of a Cabinet department of health, education, and social security to supersede the Federal Security Agency. He urged the extension of the unemployment compensation program to cover agricultural workers, public employees, and other excluded groups, as well as a health-insurance program which would make adequate medical care available to everyone.

In the housing program, the President said we would continue to rely primarily upon private housing construction. In education, he favored basic legislation under which the Federal Government would supplement the resources of the states to assist them to equalize educational opportunities and achieve satisfactory educational standards. To foster the flow of scientific knowledge, he recommended a National Science Foundation, or its equivalent.

The President said we should shift our agricultural policy from subsidies to providing technical guidance to all farmers for soil conservation and management. In order to push forward basic research in the use of atomic energy, he recommended a program involving expenditures of $444,000,000 in the fiscal year 1948. He also recommended that Congress extend the authority for rent control; price control on sugar, sirups, and rice; sugar rationing; export and import controls; priority and allocation controls on a few commodities still in short supply; and a few other minimum controls. He urged the strengthening of peacetime regulatory agencies, such as the Federal Trade Commission, the Federal Power Commission, the Antitrust Division, and the Tariff Commission. He recommended that Congress authorize grants to states through the Department of Labor for programs fostering safe work conditions, the new program to be administered by state departments of labor under Federal standards.

MID-YEAR BUDGET REVIEW

On Aug. 20, President Truman submitted to Congress his annual mid-year review of the budget. On the basis of estimates of expenditures and receipts of the Federal Government during the fiscal year ending June 30, 1948, a budget surplus of $4,700,000,000 was indicated. He declared that the surplus, together with part of the present cash balance, would be devoted to the retirement of the public debt.

EXTENSION OF WAR CONTROLS

On Feb. 3, 1947, President Truman asked for another year of control over scarce sugar, grains, flour, rice, molasses, fats and oils, meat and dairy products, peas, beans, fish, industrial materials such as cinchona bark, alkaloids, rubber, manila and agave fiber and cordage, tin and antimony. Shortages in freight cars, automobiles, tractors, and the drug, streptomycin, also demanded continuance of controls, he said. He requested that the United States Maritime Commission be permitted to operate certain shipping lines and the Army and Navy to supply local transportation to personnel where public facilities were inadequate. Permission to operate ships under less restrictive rules as to equipment and manning than would otherwise be the case was necessary for troops stationed abroad. The President promised that controls would be relaxed as soon as possible.

On Feb. 7, the President urged upon Congress the need of continuity in the policy and administrative action concerning natural and synthetic rubber. Stating that it appeared probable that in late 1947 or early 1948, natural rubber production would have increased where it would be possible to satisfy world rubber needs largely from natural rubber, he recommended to Congress that it make a declaration of policy to the effect that it was the firm intention of the Government to maintain a synthetic-rubber industry in the United States, adequate to the minimum needs of national security. He further recommended such legislation as was found necessary to accomplish this objective.

In a step foreshadowed in his message of Feb. 3, President Truman recommended to Congress on Feb. 19 a sweeping revision of legislation under which the executive branch of the Government had been exercising extraordinary powers pursuant to declarations of a state of emergency by President Roosevelt. The President told Congress that his recommendations would, if accepted, materially assist in further freeing the country of war controls and would help make possible an early ending of the emergencies. The message divided the more than 100 emergency laws on the list into five categories: temporary statutes which should be repealed; permanent statutes effective only during an emergency; statutes appropriating funds; statutes which should be temporarily extended; and statutes remaining in force for the period or purpose stipulated.

In a message on March 19, 1947, the President recommended that the authority derived from the Export Control Act be extended for a period of one year beyond June 30, 1947. A review of domestic and world supplies had convinced him that the Government must continue its control over the export of products in which critically short supplies existed. This was necessary in order to protect the economy of the United States as well as to discharge our international responsibilities. By retaining the ability to channel commercial exports of critically scarce materials, we could permit export of these products to countries whose need was greatest and also could use the power to implement our foreign loan program The President looked forward to the time when the United States and other countries could remove interferences to the free flow of commodities in world trade. He repeated this request in a message of May 23.

JEFFERSON DAY DINNER

President Truman told Democratic party leaders at a Jefferson Day dinner on April 5 that the United States must take a positive stand against aggression, which included secret as well as armed infiltration He said his foreign policy was tha of "aiding those peoples whose freedoms are endangered by foreign pressure." The United States must "stand guard" before the United Nations and "when necessary, supplement its activities."

Concerning domestic affairs, the President asserted that any substantial reduction of the budget would be an invitation to disaster, and tha attempts to reduce income taxes 2 to 30 per cent would be extremely shortsighted without making a rea effort toward debt reduction. He promised to support tax reduction at the proper time. He reiterated his concern over the prevailing level of prices and declared these prices must be brought down if our entire economy was not to suffer.

WARNING AGAINST RISING LIVING COSTS

Addressing the annual luncheon meeting of the Associated Press in New York April 21, President Truman sounded a new alarm against rising living costs and called for a united effort by government, industry, agriculture, and labor to prevent a disastrous depression. He said that prices must be brought down by private enterprise and asked moderation from labor. He also requested all-out farm production and resistance to tax cuts until the country was over the danger of inflation. He warned that, unless all cooperated, an economic cloudburst might weaken American resistance to totalitarianism and leave free peoples everywhere easy targets for external pressures and alien ideologies.

PUBLIC HEALTH PROGRAM

President Truman, in a message to Congress May 19, renewed his plea for enactment of a long-range public health program, including provisions for disability insurance. Asking that the task be given immediate attention, he told Congress that, of the four basic risks to the security of the working people and other families, we had provided some protection against three—unemployment, old age, and death. He said that protection against sickness was the major missing element in our national social insurance program. In addition to insurance against sickness, the President asked for adequate public health service, including an expanded maternal and child health program; additional medical research and medical education; and more hospitals and doctors in all areas of the country where they were needed.

ATTACKS SENATOR TAFT'S ECONOMIC VIEWS

In a long prepared statement which he read at his news conference June 5, President Truman denounced as "fallacious and dangerous" certain economic views which he attributed to Senator Robert A. Taft. The President took the position that Senator Taft stood for the theory that high demand justified or necessitated high prices. He said that this view could only rely on the "old idea of boom or bust." He repeated his belief that the danger of collapse in the national economy could be averted by voluntary price reductions.

OPPOSITION TO RENT RISE

An order for a general ten per cent increase in rents drawn up by Major Gen. Philip B. Fleming, head of the Office of Temporary Controls, was countermanded by President Truman on Jan. 26, 1947. At his news conference a few days later, the President told reporters he was determined to hold the line against any blanket rent increases. He admitted there should be some adjustments where rents were so low as to work a hardship on the property owners.

EXTENSION OF FEDERAL RENT CONTROL

On June 30, President Truman reluctantly signed the bill approving an extension of modified Federal rent control until March 1, 1948, but he said it would lead to rent increases for millions of families. He accused Congress of permitting a real-estate lobby to force the enactment of the bill and called for an investigation of this lobby. Declaring that he had no choice but to sign the bill, since otherwise all rent controls would be removed, he demanded that Congress stay in session long enough to meet squarely the national housing problem and enact a bill along the lines of the one sponsored by Senators Taft, Ellender, and Wagner.

REORGANIZATION PLANS OF 1947

On May 1, President Truman transmitted to Congress two Reorganization Plans. The provisions of the first plan were designed to maintain organizational arrangements worked out under authority of Title I of the First War Powers Act. Its objectives were to provide for more orderly transition from war to peacetime operation and to supplement previous actions looking toward the termination of wartime legislation.

Plan No. 2 permanently transferred the United States Employment Service to the Department of Labor. It also transferred the functions of the Administrator of the Wage and Hour Division to the Secretary of Labor to be performed subject to his direction and control. In order to assume more uniform and effective action by Federal contracting agencies, the Secretary of Labor was authorized to coordinate the administration of the acts for the regulation of wages and hours on Federal public works.

The President transmitted Reorganization Plan No. 3 of 1947 to Congress on May 27, asking for the creation of a new housing and home finance agency to coordinate and supervise government housing activities, temporarily consolidated under the National Housing Agency, which was due to expire with the First War Powers Act. He said the action was necessary to prevent a scattering of Federal housing programs and machinery with the expiration of his wartime consolidating power.

PORTAL-TO-PORTAL PAY SUITS BANNED

On May 14, President Truman signed the bill barring portal-to-portal pay claims, past and future, stating that he believed that "in the interest of the economic stability of our nation, it is essential to clarify the matter by statute." In his message to Congress, he again urged that the minimum wage provided by the Fair Labor Standards Act be increased from the present 40 cents an hour to 65 cents. He also asked that minimum wage benefits be extended to many persons not protected by the law.

VETO OF TAX REDUCTION BILLS

On June 16, President Truman vetoed the $4,000,000,000 tax reduction bill, declaring it offered "dubious, ill-apportioned, and risky benefits at the expense of a sound tax policy and is, from the standpoint of government finances, unsafe." He told Congress the time for tax reduction would come when general inflationary measures had ceased and the structure of prices was on a more stable basis. He criticized the measure passed by Congress on the ground that it reduced taxes in the high income brackets to a grossly disproportionate extent and failed to give relief in the lower brackets where it was most needed. He recommended that Congress study and plan for a thorough-going revision of the tax system. The House o Representatives failed by a margin of two votes to pass the bill over the President's veto.

In his veto message of July 18 President Truman pointed out tha the new bill to reduce taxes wa identical to the one he had vetoe June 16 except for a change made i the effective date from July 1, 194 to Jan. 1, 1948. He asserted that th reasons for a veto were more com pelling than a month earlier, point ing particularly to the necessity o keeping revenues high in order t maintain national defense and dis charge responsibilities for interna tional rehabilitation. He declare that, until we were better able t estimate the cost of our investmen in world peace and collective security it was unwise to make so large a cu in the Government's future incom that ability to meet our needs woul be impaired. He repeated his crit cism of the tax relief bill as unfa to low-income groups.

VETO OF LABOR BILL

As was generally expected, Pres dent Truman, on June 20, vetoed th Taft-Hartley bill to curb labor union In his message to Congress, the Pres dent called the bill unfair and u workable and said it would promo strikes. He declared that "the b taken as a whole would reverse the basic direction of our national labor policy, inject the government into private economic affairs on an unprecedented scale, and conflict with important principles of our democratic society." He invited Congress to try its hand again with a wholly new bill.

The House of Representatives promptly voted, 331 to 83, to pass the bill over the President's veto. President Truman, in a radio address, denounced the bill as a "shocking piece of legislation," and expressed the hope that it would not become law. Despite his protest the Senate voted the bill into law overriding the President's veto by a vote of 68 to 25.

VETO OF WOOL PRICE SUPPORT BILL

On June 26, President Truman vetoed the bill authorizing curbs on foreign wool imports. He declared the bill would be a tragic mistake just at a time when this country was seeking international agreement for reducing trade barriers, and that it would be a blow to our leadership in world affairs. At the same time he agreed to approve a bill which would support domestic wool prices through government purchases alone.

ARMY-NAVY MERGER

President Truman announced Jan. 16, 1947 that the War and Navy Departments had agreed to unification of the Armed Forces, something he had recommended on several occasions. The most radical step in the proposed plan was that only the new Secretary of National Defense would have Cabinet status. Instead of creating a single Department of National Defense, the plan proposed that the present War and Navy Departments, plus an entirely new Air Department, should remain as entities, and that the new National Defense Secretary should become a super-Secretary over the entire establishment. On Feb. 26, he sent to Congress the draft of a proposed bill to provide for carrying his recommendation into effect. The bill became law July 17, and the President nominated Secretary of the Navy, James V. Forrestal, as Secretary of Defense.

END OF SELECTIVE SERVICE

President Truman recommended on March 3 that Selective Service be allowed to lapse on March 31, 1947. He told Congress that there was no guarantee that the volunteer system would keep the Army, including the Air Force, at 1,070,000 and the Navy at 571,000 during the ensuing year, figures which must be maintained if the nation was to have reasonable insurance of security. Fearing that volunteers might fall off in the fiscal year ending June 30, 1948, the President asked Congress for a "gentleman's agreement" that the War and Navy Departments might ask for re-establishment of Selective Service if the numbers should fall below the figures set.

In order to provide for the orderly and expeditious liquidation of the Selective Service System on March 31, the President in a message of March 10, recommended the enactment of a law which would establish an Office of Selective Service Records and establish and maintain Federal record depots in the states, the District of Columbia, and the territories and possessions of the United States.

UNIVERSAL MILITARY TRAINING

President Truman, in a message telegraphed on Aug. 28 to the opening session of the American Legion's annual convention in Madison Square Garden, New York, declared that only universal training would assure us that sufficient forces would be available in the critical emergency of a total war.

FLOOD CONTROL AND CONSERVATION

Citing the long list of midwest floods, President Truman, in a special message to Congress July 16, urged early action on a ten-year program to check floods in the entire Mississippi Basin. He asked Congress to appropriate $250,000,000 in 1947 for the purpose. The President took occasion in dedicating the Everglades National Park on Dec. 6 to emphasize the need for conservation of our national and natural resources.

PRESIDENTIAL SUCCESSION

On Feb. 5, 1947, President Truman sent a letter to Arthur H. Vandenberg, President of the Senate *pro tempore*, repeating his previous suggestions that Congress should give consideration to the question of Presidential succession. He again recommended that the Speaker of the House of Representatives be placed first in order of succession, and if there were no Speaker, or if he failed to qualify, that the President *pro tempore* of the Senate should act until a duly qualified Speaker was elected. In the event that Congress should not be disposed to enact such a bill, the President asked that some other plan of succession be devised so that the office of President would be filled by an elected officer, rather than one whose succession rested with the Chief Executive, as in the case of Cabinet officers.

FREEDOM AND EQUALITY

In an address June 29 at the annual convention of the National Association for the Advancement of Colored People, President Truman declared that we had reached "a turning point in the long history of our country's efforts to guarantee freedom and equality to all our citizens." The extension of civil rights today meant, he said, not protection of the people against the Government, as in past times, but protection of the people by the Government. The Federal Government must be made "a friendly, vigilant defender of the rights and equality of all Americans." The President asserted that there was "no justifiable reason for discrimination because of ancestry, or religion, or race, or color."

PURGE OF DISLOYAL GOVERNMENT EMPLOYEES

On March 22, 1947, President Truman ordered a drive to purge the Government of disloyal employees. In addition to treason, sedition, advocacy of revolution and acting in the interest of a foreign power, the President ordered that loyalty investigations take into consideration "sympathetic association" with any group held to be inimical to the American system. He created a new loyalty board in the Civil Service Commission to review cases of persons recommended for dismissal on loyalty grounds and ordered each government department or agency to establish one or more loyalty boards.

He released a statement to the press Nov. 14 which carried the information that any person suspecte of disloyalty must be served with written notice of the charges agains him and could appeal the finding against him to the head of the department and then to the Loyalty Review Board within the Civil Service Commission.

GOOD NEIGHBOR POLICY

In an address at a state dinner hel in his honor in Mexico City on Marc 3, President Truman assured Mexic and the other American Republic that the United States would remai faithful to its non-intervention commitments. He said that the Unite States could not be indifferent t happenings beyond its borders because the lawlessness of one natio might threaten the very existence the law on which all nations depended; but he emphasized that n nation, by reason of its strength, ha the right to impose its will on weaker member of the internation family.

On May 26, the President urge Congress to authorize a comprehe sive program of military collabor tion with all Western Hemisphe nations. The plan aimed at moder zation and standardization of arm services in Latin America and Ca ada. The President gave assurances that the United States would not approve or participate in the indiscriminate or unrestricted distribution of armaments. Operations under the program would be subject to any international agreement for the regulation of armaments to which the United States might be a party. President Truman said that, under the program, care would be taken to guard against placing weapons of war in the hands of any groups who might use them to oppose peaceful and democratic principles.

INTER-AMERICAN DEFENSE CONFERENCE

President Truman closed the Inter-American Defense Conference at Petropolis, Brazil, Sept. 2, with a speech in which he reduced the basic foreign policy of the United States to a desire for permanent peace, but at the same time emphasizing that the nation was determined to remain strong in order to carry out this policy. Reiterating the fidelity of the United States to the United Nations, he said "we shall not forget our obligations under the Charter, nor shall we permit others to forget theirs."

Speaking before a joint session of the Brazilian Congress Sept. 5, the President emphasized strongly the cooperation between Brazil and the United States in hemispheric policy and in playing a firm role in the United Nations.

SUPPORT OF UNITED NATIONS

The President submitted to Congress on Feb. 5, 1947, his first annual report on the activities of the United Nations and the participation of the United States therein. After a review of the accomplishments of the United Nations, he declared that our policy of supporting the organization with all the resources we possess must be given effective practical application on a genuinely national, bipartisan basis. He said that such support was just as necessary in the economic and social field as in the political field.

FOREIGN RELIEF

On Feb. 21, 1947, the President asked that $350,000,000 be voted for relief aid to people of liberated countries abroad. Noting that full-scale supply operations by UNRRA were rapidly drawing to a close, he said that "on humanitarian grounds, and in the light of our own self-interest as well, we must not leave the task unfinished."

On Feb. 24, the President recommended that Congress authorize the United States to participate as a member of the International Refugee Organization. Pointing out that there were more than 1,000,000 displaced persons remaining in Germany, Austria, and Italy, almost two-thirds of whom were under United States care and control, he said he felt sure that, with the prompt leadership of the United States, the Organization would be in a position to function as an international body to perform an essentially international service.

In making public on Feb. 28 a progress report from his Cabinet Committee on World Food Programs, President Truman said that the Government's goal of 400,000,000 bushels of relief grain shipments for 1946-47 would be reached two months ahead of time. However, he called for maximum deliveries after the June 30 deadline in the interest of world stability and freedom. He said there were no grounds for complacency since the battle for food was by no means over. Urging continued sharing our abundance with those in dire need, the President declared that every additional pound of grain we could export was a contribution to reconstruction and world peace.

In a message to Congress July 7, President Truman again advocated legislation to enable a substantial number of displaced persons to enter the United States as immigrants. He declared that there was no proposal for a general revision of our immigration policy or a lowering of our standards for testing the fitness for admission of every immigrant, including the displaced persons. He added that we could readily absorb the relatively small number of displaced persons who would be admitted.

TRADE AGREEMENTS PROGRAM

Procedures on trade agreements programs were outlined by President Truman in an executive order and an accompanying statement issued Feb. 25, 1947. The President affirmed the faith of the Administration in the program which, he said, had been an integral part of our foreign policy, with widespread support from industry, labor, and farmers. The new executive order, according to the President, made some procedural changes which gave assurance that American interests would be properly safeguarded. As on other similar occasions, he called for bipartisan support of our foreign economic policy.

President Truman, in an address at Baylor University March 6, asserted that the United States must take the lead in reducing international trade barriers; otherwise we would plunge the nations into economic war. Now, as in 1920, the President said, the world had reached a turning point in its history. National economies had been interrupted, economic policies were in a state of flux, and the decisive factor would be the type of leadership the United States could give to the world. He attacked those who, for partisan advantages, would seek to undermine the foreign economic policy of the Government and return to the period of high tariffs and economic isolation. Asserting that business is poorer when markets are small and good when they are big, he forecast a larger foreign trade under the proposed International Trade Organization. He declared that peace and freedom could not be achieved by force but by mutual cooperation and a willingness to deal fairly with every friendly nation in all political and economic matters.

CHANGE IN NEUTRALITY POLICY

Pointing out that the Government of the United States was obliged by the Neutrality Act of 1939 to "treat aggressor and aggrieved, peacemaker and troublemaker" alike in the matter of permitting American manufacturers to supply them with arms, ammunition, or implements of war, the President, on April 15, proposed that Congress delete from the statutes the legal concept of compulsory neutrality as contained in Section 12 of the Neutrality Act. He asked for the enactment of a Munitions Control Act of 1947, which would give the President broad discretionary powers, through a licensing system, to grant or withhold military equipment to or from foreign governments. The new act would enlarge the President's discretion in the designation of articles the export of which he considered dangerous to the security of the United States.

AID TO GREECE AND TURKEY

Addressing a joint session of Congress March 12, 1947, President Truman asked that $400,000,000, men, and materials be sent to Greece and Turkey to battle totalitarian aggression. He expressed the belief that "it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressure." In reply to those who had suggested that Greece was a problem for the United Nations and not for United States action alone, President Truman said the need for immediate action was so urgent that there was no way at the time for the United Nations to extend help.

Although he did not name them, he, in effect, accused the Soviets of violating the Yalta Agreement for freedom of choice by European nations as to the kind of governments they wanted. He declared that the United States had made frequent protests against coercion and intimidation in Poland, Rumania, and Bulgaria. He added that there had been similar developments in a number of other countries. In closing his address, the President emphasized the gravity of the steps he proposed, but said the welfare of the United States and the peace of the world were involved.

President Truman signed the Greek-Turkish aid bill May 22, 1947. Stating that the conditions of peace included the ability of nations to maintain order and independence, and to support themselves economically, he asserted that the newly approved act was an important step in the building of the peace. He maintained that, in extending aid requested by Greece and Turkey, the United States was helping to further aims and purposes identical with those of the United Nations, and was proof of the fact that we not only pledge support to the United Nations but that we act to support it.

DENUNCIATION OF THE HUNGARY COUP

On June 5, President Truman denounced the Communist coup in Hungary as an outrage and approved the dispatch of a sharp note of protest by the State Department to the Soviet commander in Budapest. He added that the United States did not intend to stand idly by in the circumstances.

KANSAS CITY SPEECH

Addressing a convention of war veterans in Kansas City June 8, President Truman said that it was our obligation to lead the peoples of the earth toward the goal of lasting peace. He declared that we would "continue every effort to obtain the ideal of a United Nations which can banish war for all time." This necessitated the maintenance of our Army, Navy, and Air Force in effective readiness for any emergency. In emphasizing also the need for maintenance of a sound and prosperous economy, the President reviewed his previous recommendations to Congress for legislation in the social and economic fields.

REAFFIRMATION OF AID POLICY

Speaking before the Canadian Parliament June 11, President Truman asserted that the United States intended to aid those nations which seek to live in peace. He pledged use of our resources in promoting world recovery. He also called for completion of the St. Lawrence waterway project.

INDEPENDENCE DAY ADDRESS

Pleading for dropping of barriers between all nations of the world, the President, in his Independence Day address at Monticello, accused certain nations of withholding their support of reconstruction plans for Europe on the ground that it would mean interference by some nations in the internal affairs of others. His remarks were interpreted as being aimed at Soviet Russia's withdrawal from the Paris economic conference which was called to discuss Secretary of State Marshall's plan for United States aid on a basis of European self-help. The President declared that the cooperation of all nations was necessary for reconstruction and the production and exchange of goods. He added that an important step to assure world peace would be to stop propaganda attacks upon other nations. The first requisite of peace, he said, was "adherence to the principle that governments derive their just powers from the governed."

ASSURANCE OF AID TO ITALY

On Dec. 13, on the eve of the withdrawal of the last American troops from Italy, President Truman announced that the United States would consider appropriate measures for maintaining peace and security should the independence of Italy be threatened.

FOOD CONSERVATION

On Sept. 25, the President organized a national drive against the waste of food. Toward this end, he appointed a 26-member citizens food committee to map a domestic campaign as the first requisite to an aid-Europe plan. Charles Luckman, president of Lever Brothers, Cambridge, Mass., was made chairman of the committee, which included housewives, food experts, heads of farm and labor organizations, and representatives of the food distribution field.

Addressing the first meeting of the Citizens Food Committee Oct. 1, the President set a goal of 100,000,000 bushels of grain which must be saved by the American people to be sent to Europe in addition to the 470,000,000 bushels earlier estimated as the limit which could be spared. In a radio address Oct. 5, he urged the American people to conserve food. He lashed out angrily at grain speculators.

EUROPEAN RELIEF AND PRICE CONTROLS

President Truman, on Sept. 29, told a group of Congressional leaders that an additional sum of $580,000,000 was needed to help France and Italy survive the winter months as free and independent nations. He made it clear that the figure was a rock-bottom estimate. He included Austria in his calculation but said that there would have to be a separate appropriation for War Department administration of the occupation zones abroad. The President declared that the prospect of a general recovery program for western Europe, aided by the United States, had raised hopes for eventual recovery and had strengthened democratic forces.

By proclamation issued Oct. 23, the President called Congress to reconvene Nov. 17 to appropriate funds for emergency relief in western Europe and to curb the high cost of living at home. In a radio broadcast to the nation Oct. 24, he asserted that legislation by Congress was essential to meet the immediate needs of Europe, particularly France and Italy. He stressed that action by the Government in no way reduced the necessity for pressing forward the voluntary food-saving program.

Addressing the specially reconvened meeting of Congress on Nov. 17, the President combined an appeal for immediate relief to Europe with a program calling for limited price and wage controls. He postponed discussion of long-term aid to Europe to a later date, concentrating on stop-gap relief and the somewhat related subject of domestic inflation. While urging continued voluntary attempts to combat inflation, he proposed a ten-point program directed toward relieving monetary pressures, channeling scarce goods into most essential uses, and dealing directly with specific high prices.

EUROPEAN AID PROGRAM

President Truman, in a message to Congress Dec. 19, asked for a $17,000,000,000 European recovery program and a bold defense of free men against totalitarian pressures. He proposed that the sum be invested over four and a quarter years as a major step in our quest for a just and lasting peace. As a first installment, he asked for authority to spend $6,800,000,000 in the first 15 months. He predicted that opposition already announced by European Communists would result in further incitement to strike "for the purpose of bringing chaos in the hope that it will pave the way for totalitarian control." Along with his message, the President forwarded to Congress a bill to authorize the $17,000,000,000 expenditure and set up the machinery for carrying out the long-range recovery program.

CRITICISM OF ANTI-INFLATION BILL

Although he denounced the Republican anti-inflation bill as feeble and pitifully inadequate, President Truman, in a special statement issued Dec. 28, announced that he would sign the measure. He promised that the powers granted to the Administration in the bill would be used but said the public must not be misled into believing they would reduce the high cost of living or keep prices from going even higher. Instead, he asked Congress to pass the original ten-point program he submitted Nov. 17, which for the most part was rejected.

PARDONS DRAFT EVADERS

On recommendation of his Amnesty Board, headed by Owen J. Roberts, former Associate Justice of the U. S.

Supreme Court, President Truman, on Dec. 23, granted a full pardon, restoring all political and civil rights, to 1,523 men who were convicted of violating the Selective Service Act during the war. Religious conscientious objectors, Japanese Nisei, and draft evaders who subsequently served honorably in the Armed Forces, and others who proved their evasion was due to ignorance, were included in the list.

SCIENCE COORDINATING COMMITTEE

By an executive order issued Dec. 24, President Truman established an Interdepartmental Committee for Scientific Research and Development to coordinate Federal scientific activities. He assigned to the committee the tieing together of the manifold and growing scientific operations of the Government, ranging from crop improvement to atomic energy.

NATIONAL PERSONALITIES

By Clark F. Norton
Professor, University of Michigan

HERBERT C. HOOVER

Former President Herbert C. Hoover continued to serve his country with distinction in 1947. At the age of 72, he completed his third postwar food mission and accepted the chairmanship of the newly created Commission on the Organization of the Executive Branch.

Upon President Truman's request, Hoover agreed (Jan. 22) to undertake a study of food conditions and related matters in the British-American zones of Germany and Austria. Following a two-week personal survey of those areas in February, he made three extensive reports on the problem to the President. For Germany, he proposed (Feb. 27) an immediate increase in food supply for certain groups. The cost to the United States could be reduced, he suggested, by transporting goods in German-operated American ships, replacing destroyed German fishing boats, and increasing the export level of German manufactured goods. Moreover, he believed (Feb. 26) that all relief expenditures should be continuously supervised by experts, used for nonpolitical purposes, and repaid by an export tax on the debtor countries.

Hoover recommended (March 10) for Austria an emergency relief appropriation of $155,000,000, economic unification of the four zones, the release of lands and factories requisitioned by the Soviet Union, and reduction in the size of Russian armies. He cautioned, however, that a real solution would depend upon freeing Austrian economy to produce and export. Likewise, he concluded (March 23) that Germany would remain a drain on United States resources until her heavy and light industries were restored to production. Consequently, he opposed the removal or destruction of industrial plants and the separation of the Ruhr or the Rhineland from Germany. In particular, he condemned (April 18) the Allies for destroying Europe's capacity to produce fertilizer while the whole continent was "gasping for food."

A sizable part of the German food crisis Hoover attributed (May 15) to the failure of the Germans themselves to collect indigenous food from their own farmers. After a study of the American economic situation, he concluded (June 15) that, unless production was increased or consumption decreased, the United States must considerably reduce its export volume. Our trade balance could be improved, he said, by importing and stockpiling such commodities as tin, manganese, copper, lead, etc. He also advocated (July 12) adopting a voluntary food conservation program.

On several occasions the former President severely criticized the

Soviet Union. The "chaos and misery" in Greece could be greatly alleviated, he claimed (March 24), if Premier Stalin would order guerrilla raids to cease. Because of Russian obstruction to peace efforts, Hoover proposed (May 26) that the other Allies proceed immediately to negotiate treaties with Germany and Japan. Nevertheless, he believed (Aug. 9) that the Russian "instrument of ideological penetration" was weakening, and he predicted (Nov. 20) that ultimately the Communist-dominated nations in eastern Europe would "throw off their chains" by revolution.

During the last quarter of the year, Hoover devoted himself to the bi-partisan commission created by Congress to survey the structure and operation of the Federal executive branch. Named (July 16) to the post by Speaker of the House Joseph Martin, Hoover was elected (Sept. 29) chairman of the body by its other 11 members. By December, the commission under his direction had parceled out for study to committees several phases of the problem and had the project well under way.

ARTHUR H. VANDENBERG

In 1947, Senator Vandenberg, president pro tempore of the Senate and chairman of the Senate Foreign Relations Committee, achieved distinction through his efforts to unify and strengthen United States' foreign policy. Moreover, despite repeated denials, he was widely regarded as a possible candidate for the Republican presidential nomination in 1948.

Vandenberg's bi-partisan approach to the conduct of foreign relations appeared clearly in his speech at Cleveland (Jan. 11) setting forth his basic convictions on American foreign policy. There, he assured the world that the United States would fully support the United Nations, promote democracy and human rights, seek peace with justice, and align itself against aggression. However, he warned that disarmament and the release of atomic bomb secrets would depend upon like disarmament by other major powers and the establishment of effective international controls. To improve United Nations operations, he proposed exempting the settlement of disputes from Security Council veto and the adoption of a sterner, more prudent fiscal policy. Other steps Vandenberg favored included liberal European relief and rehabilitation appropriations, some form of reciprocal trade agreements, economic unity and political decentralization for Germany, rejuvenation of Pan-American solidarity, and a shift in our attitude towards China from neutrality to outright, substantial aid for the anti-communist forces.

Senator Vandenberg's decision (Feb. 4) not to attend the Foreign Ministers' conference at Moscow in March did not reflect a breach with the Administration's handling of foreign affairs. To the contrary, he approved (Jan. 29) State Department charges that the Polish provisional government had violated pledges for free elections, and he prevented a partisan struggle over the reciprocal tariff program by effecting (Feb. 4-7) a compromise in the Senate, subjecting trade agreements to review, modification, or even termination by unilateral action. During the budget debate he opposed (Feb. 21) drastic cuts in the President's estimates of military needs, and he worked (Feb. 25) for speedy approval of the President's request for American participation in the International Relief Organization.

Further evidence of the Michigan Senator's lack of partisanship in foreign policy matters was demonstrated by his leadership in the adoption of President Truman's Greek-Turkish aid program and in the confirmation of the peace treaties with the "satellite" nations. To offset objections that the United States would be bypassing the United Nations, he proposed (March 31, April 7) and secured approval of an amendment requiring the President to withdraw part or all of the assistance if a majority of the Security Council opposed it, irrespective of a "veto" by one of the

Big Five. During Senate debate on the measure, Vandenberg expressed his fear (April 8) that the collapse of Greece and Turkey "could precipitate a chain reaction which would threaten peace and security around the globe."

The value of Vandenberg's services at the Inter-American Conference in Brazil during August were testified to by a resolution adopted (Aug. 30) by that body in his honor. Both in his address to the Brazilian Congress (Aug. 29) and in his report to the American people (Sept. 4), Vandenberg stressed that the meeting demonstrated "how big and little states can work together on a basis of absolute equality of both obligation and power in the pursuit of international peace and security." Under his guidance, the Senate ratified (Dec. 8) nearly unanimously the Inter-American Treaty of Reciprocal Assistance negotiated at the conference. Earlier, he had strongly urged (April 14) the Pan American Union to invite the Dominion of Canada to become its twenty-second member.

Several times during the year Vandenberg denounced the policies of the Soviet Union. After condemning (Feb. 14) the Russians for ignoring our requests to settle lend-lease accounts, he requested (April 19) delay in further lend-lease shipments until an agreement had been reached. If the United States and Russia were to live together peacefully, he asserted (April 8) that we must stand firm for our ideals and principles. The overthrowing of the Hungarian coalition government he charged (June 3) to a small Communist minority acting under Russian sponsorship and protection. At Ann Arbor, the Senator attacked (Nov. 3) the Soviet Union for paralyzing the Security Council by its vetoes, for "subversive infiltration of other nations," for launching an anti-American vilification campaign, and for frustrating economic unity in Germany.

Though Vandenberg quickly endorsed the general principles behind the "Marshall Plan" for foreign aid, he called (June 13) for the creation of a "special bi-partisan advisory council" and the taking of a "sound, over-all inventory of our own resources" as necessary adjuncts to its full implementation. Later he indicated (Nov. 13) that he favored some repayment by aid recipients through treaties pledging certain strategic materials to the United States. The Administration's request for $597,000,000 interim relief for Europe received (Nov. 24) Vandenberg's unqualified support in the Senate, where he bore the brunt of debate against attempts to reduce its size.

Among the significant domestic issues backed by Senator Vandenberg during 1947, only the following can be noted: reduction by constitutional amendment of the voting age to 18 years; legislation outlawing strikes against the government, jurisdictional strikes, secondary boycotts, and labor violence; early termination of the bulk of all wartime economic controls; reduction in the Federal budget; limitation of presidential tenure to two terms; establishment of a new line of presidential succession through the Speaker of the House and President pro tempore of the Senate; and confirmation of David E. Lilienthal as chairman of the United States Atomic Energy Commission.

ROBERT A. TAFT

Senator Robert A. Taft, chairman of the Senate Labor and Public Welfare Committee and of the Joint Committee on the Economic Report, ranking majority member of the Senate Finance Committee and head of the Senate Republican Policy Committee, played a dominant role during 1947 in national domestic legislation. Moreover, in the fall he announced his candidacy for the 1948 Republican presidential nomination.

Taft's influence was especially marked during the consideration and adoption by Congress of the Labor-Management Relations Act. Not satisfied with the Labor Committee's version of the bill which he originally sponsored, Taft advocated on the

Senate floor four "stiffening" amendments, three of which were adopted. The final act approved by both houses in June substantially incorporated Taft's principles. In July he was named a member of the Joint Committee on Labor-Management Relations provided for by the law.

In the field of national fiscal policy, Taft demanded a reduction of $3,500,000,000 to $4,000,000,000 in the Federal budget, a 20 per cent cut in personal income taxes (effective July 1), and a 10 per cent slash in military and naval appropriations. After President Truman had criticized (June 5) Taft's economic philosophy as "fallacious and dangerous" because it was based on "the old idea of boom and bust," the Senator in turn blamed (June 6) the President for having "created all the basic conditions which compel high prices."

Again in 1947, Taft championed in Congress a long-range national housing program. The provision of decent shelter for low-income groups he considered an essential Federal responsibility. Likewise, he continued to press for the establishment of an executive department of Health, Education and Security, and he introduced a bill providing sizable grants of Federal aid to states for public education. Despite opposition by a majority of Republican Senators, Taft joined forces with the Democrats to secure approval (July 22) for President Truman's reorganization plan incorporating major housing agencies into a single administrative unit.

On a number of other issues, however, Taft bitterly fought the Administration's program. David E. Lilienthal's nomination to the United States Atomic Energy Commission chairmanship he attacked (Feb. 21) on the grounds that Lilienthal was "temperamentally unfitted" for the job and was "too 'soft' on issues connected with communism and Soviet Russia." He recommended (April 2) that the United States plan for the control of atomic energy should be withdrawn from the United Nations until a general disarmament agreement could be reached. The proposed universal military training act, Taft asserted (June 26), was unnecessary, wasteful, and not beneficial to the health or morale of the nation's youth. He also opposed (July 24) continuation of the State Department's foreign information service.

During a tour of six western states in September and early October, Taft made several addresses and held numerous political conferences. To foster domestic economy he advocated stabilizing prices and wages, reducing taxes and governmental expenses, cutting voluntarily the consumption of scarce and high-priced commodities, limiting public works, and enacting broad social aid legislation.

In a sweeping denunciation of the Administration's foreign policy, Taft declared (Sept. 25) at Tacoma that America had already "lost the peace." In particular, he criticized the concessions made to Russia, the vengeance motive prevalent in our treatment of Germany, and the use of American financial resources to force our ideas on the rest of the world. The guiding principle of our foreign policy should be, said Taft, to maintain peace so long as our freedom is not threatened. Other basic tenets he advanced called for combatting communism at home first, signing a peace treaty with Japan as quickly as possible, maintaining strong national defense forces, and retaining control of the atomic bomb. The plan to partition Palestine received (Sept. 21) his full support, and he approved (Sept. 29) further aid to Europe that would help stricken nations to rehabilitate themselves. Later, he favored (Nov. 18) immediate admission of displaced persons up to the total of unused immigration quotas.

Although Taft declared in February that he was not an "active" candidate for President, political circles generally assumed to the contrary. In late July, he received pledges of support from his colleague, Senator Bricker, and from the Ohio Republican organization, but not until Oct. 24 did he formally announce that he would seek, without an active political campaign, the Republican nomination. In December, Taft declared that he would not accept the nomination for Vice-President.

The two issues which Congress was summoned to consider on Nov. 17—aid to Europe and the control of inflation—were the subjects of numerous pronouncements by Taft. In general, he favored aid for European rehabilitation on a somewhat limited basis. For instance, he supported the unsuccessful attempt to cut by one-third the appropriation of a $597,000,000 emergency relief fund. The long-range Marshall Plan he objected to on the grounds that it would inevitably result in higher prices, increased taxes, and the reimposition of wartime economic controls. Moreover, he feared that the United States would make itself vulnerable to charges of interference and imperialism and would be encouraging unsound fiscal policies and false currency values. In addition, he questioned whether "lavish dispensation of American dollars" would have much influence on the acceptance or rejection of communism in Europe. At any rate, Taft wanted the expenditures financed from current taxation and an independent board created to administer the whole program.

To check inflation, Taft advocated cutting government expenditures, reducing taxes, holding wages down, increasing production, limiting exports, checking bank credit, controlling government purchases for export abroad, and maintaining support prices only to honor prior commitments. Further, he contended that a campaign discouraging spending, encouraging saving, and appealing to industrialists to forego profits would have some benefit. President Truman's ten-point program to revive partial wage, price, and rationing controls, however, Taft denounced as a "step toward a completely totalitarian nation." He was instrumental in Congressional passage of a greatly modified anti-inflation bill which, although described (Dec. 28) by the President as a "pitifully inadequate weapon," he claimed (Dec. 29) would assure the Administration ample authority to curb the principal causes of inflation.

HAROLD E. STASSEN

Few presidential candidates have managed, without benefit of public office, to maintain themselves in the political spotlight to the extent that Harold E. Stassen did in 1947. Through frequent pronouncements on current issues and a fact-finding European tour, he commanded almost continuous national attention.

Early in the year, Stassen condemned (Jan. 11) President Truman's budget as "padded, wasteful, and extravagant." In his opinion, national expenditures should be reduced $5,000,000,000 and income taxes cut 10 per cent or more. The Republican party, he believed (Jan. 20), should champion small business. In labor-management relations he favored (Feb. 7) outlawing mass picketing, jurisdictional strikes, secondary boycotts, and foremen's unions, but he opposed compulsory arbitration, special labor courts, drafting strikers, and issuing injunctions upon private petition. Legislation requiring unions to file financial statements, elect officers by secret ballot, and vote on proposed strikes received his approval. Not satisfied with his party's high tariff policy, he supported (Feb. 12) the Administration's reciprocal trade program.

For two months (Feb. 23-April 29), Stassen traveled through 16 European countries in order to study their economic problems and to broaden his knowledge of world conditions. At Moscow he exchanged viewpoints (later published in full) with Premier Stalin on such topics as Russian-United States co-operation, control of atomic energy, and censorship of the press. Upon returning, he expressed (April 29) the belief that, if the United States "remains strong and follows wise and humanitarian policies," peace could be established at least for a generation.

Time and again Stassen called on the United States to extend financial and material assistance for world rehabilitation. With minor reservations, he endorsed (May 5) President Truman's Greek-Turkish aid plan. He proposed (May 21) a long-range program whereby the United States during the next decade would distribute 10 per cent of its production to needy nations; repayment would be through access to raw materials and by agreements which prohibited discrimination against Americans, further nationalization of industry, and exploitation of dependent peoples.

In the same vein, he suggested (June 16) that, after a careful, bipartisan analysis of American resources had been made, priorities for the allocation of relief goods be established and (July 30) aid be made conditional upon resistance toward socialism. His warning to the American Legion's 29th annual convention (Aug. 31) that the alternative to American help for Europe would be the spread of communism helped secure unanimous approval by that body of the Marshall Plan. In calling upon the President to summon Congress to consider European relief, Stassen proposed (Sept. 17) the creation of a "Peace Production Board" for purchasing and shipping abroad both food and materials.

Improvement in Russian-American relations, Stassen said (July 14), depended upon convincing the Soviet Union that the United States economic system will continue to function successfully and that Communists can not infiltrate and dominate any major power. United States Communists should be combatted by full identification, prosecution for violations of the law, and removal from public payrolls; also, deficiencies and evils in the American system should be corrected. Despite apparent friendliness of the Russian people, he maintained (Sept. 19) that differences between the two nations constituted "the No. 1 problem of post-war relations and the greatest obstacle to lasting peace."

Meantime, Stassen was actively courting party support in his preconvention campaign for president. During the year he visited nearly all sections of the country, making contacts with state and local Republican organizations and delivering numerous speeches on national and international affairs. Though conferences with Warren, Dewey, and Taft led to the rumor that he might accept the vice-presidential nomination, Stassen denied reaching an understanding with anyone and insisted that he sought only the presidency. Announcement was made that his name would be entered in the 1948 primaries of at least three states—Wisconsin, New Hampshire, and Nebraska.

Noteworthy ideas stressed by Stassen during the fall included: a nationwide voluntary "save-food" plan (Sept. 20); the stabilization of European currencies (Oct. 7); the reestablishment of consumer credit controls (Nov. 11); a minimum guaranteed farm income (Nov. 13); an embargo on the export of heavy machinery and machine tools to the Soviet Union until that nation agreed to a constructive program for rebuilding Europe (Nov. 14); a $3,000,000,000 reduction in Federal taxes (Nov. 16); a higher income for white-collar workers (Nov. 17); the establishment of a two-party system in the South (Nov. 20); and completion of the St. Lawrence Seaway (Nov. 21).

Stassen's book, *Where I Stand* (published in November), in the main summarized his previously expressed convictions. However, for the first time he advocated that national income taxes be limited to a maximum of 50 per cent of one year's earnings. Other proposals were to eliminate from the Taft-Hartley Act the requirement for non-communist affidavits and the prohibition against political contributions or expenditures by unions, and to provide a national-state system of health and hospital insurance for those persons covered by social security.

In December, Stassen's accusations

(Dec. 10) that government officers had improperly profiteered by speculation in the commodities market brought about a series of rather spectacular Congressional investigations. Further, he blamed the failure to check living costs on the Administration's inadequate use of export controls, hoarding of scarce products, inflationary purchasing practices, and belief that wages could be raised without increasing prices.

THOMAS E. DEWEY

Thomas E. Dewey's prominence in national and state politics continued undiminished during his fifth year as New York State's chief executive. Although no formal announcement of his presidential candidacy was made until January 1948, the Republican party standard-bearer of 1944 maintained close contact with political leaders throughout the nation and was generally regarded as a leading contender for his party's nomination.

In his second inaugural address, Governor Dewey stressed (Jan. 1, 1947) the need for solving the dilemma confronting society at all levels: how to obtain security without losing individual liberties. Too often those of "extreme views" have insisted that the only choice is between reaction and radicalism; to the contrary, Dewey believed that, by adopting a middle course, security could be enjoyed without sacrificing essential freedoms.

Dewey's annual message advised (Jan. 8) caution in committing the state to public works or other large new financial outlays. In addition, he favored broadening municipal tax powers, extending rent-control legislation, increasing state employees' compensation, and authorizing by constitutional amendment higher pay for legislators and easier removal of undesirable judges. His special requests (Jan. 13, 20, 30) for sizable appropriations to complete the veterans' housing program, finance $300 salary increases for school teachers, and continue the school lunch program received prompt approval. With respect to education, he fully endorsed (March 3) recommendations made by a special committee for a minimum teachers' pay-scale, elimination of the salary differential between elementary and secondary schools, and promotions based only on demonstrated merit.

Although he submitted (Feb. 1) a record-high budget to the legislature, Dewey opposed a general increase in taxation. However, in order to retire within a decade the proposed $400,000,000 veterans' bonus bond issue (subsequently approved by public referendum), he urged raising over $40,000,000 a year additional revenue by higher cigarette and income tax rates.

As in former years, Governor Dewey freely exercised his veto prerogative; over one-fourth of the 1,231 bills submitted to him by the 1947 session of the legislature failed to receive his approval. Probably the most controversial law he signed was one outlawing strikes by public employees. In signing this measure (which he had demanded following the Buffalo teachers' strike), Dewey asserted (March 27) that "strikes against Government are wholly unlawful." Another significant act he approved authorized counties and large cities to levy special taxes. On the other hand, for example, Dewey vetoed bills to increase the civil jurisdiction of justices of the peace, to provide state operation of the Albany airport, and to permit issuing motor vehicle licenses for a nine-month period.

Turning his attention to political affairs, Dewey told (May 23) the Young Republicans of New York that their party represented widespread political viewpoints, liberal, conservative, and middle-of-the-road; any American, he said, irrespective of his political opinions, was welcome to join the party if he believed in the Constitution. Moreover, he claimed (June 7) that the Republican party offered women more opportunity for political leadership than any other. By requesting an appropriation to investigate the loyalty of Federal employees, President Truman, Dewey asserted (May 27), was admitting that the Democrats needed "a $25,000,000 spraying with D.D.T."

After attending the Governors' Conference in Salt Lake City, Governor Dewey and his family enjoyed an extensive tour of the West during July. Advertised as a non-political vacation journey with no formal speeches to be made, Dewey nevertheless talked with Republican leaders in 15 states and received numerous pledges of support for 1948.

Despite frequent charges that he was too reticent in expressing his opinions publicly, Dewey took a strong stand on a number of issues. For instance, he objected (Jan. 22, 1947) to governmental action artificially raising food prices, although he believed farmers' living standards should not be lowered. Several times (Aug. 27, Sept. 15, Oct. 10) he spoke out for expanding agricultural production through improved techniques. He believed (Aug. 5) that labor's right to organize and bargain collectively must be preserved. For national defense purposes Dewey unequivocally endorsed (Aug. 28) universal military training for able-bodied young men and demanded (Sept. 13) the maintenance of "a powerful military establishment." With obvious implications for the national Administration, he severely denounced (Oct. 31) "government by crisis" as the work of "bunglers and incompetents."

Even more pronounced were his published views on international affairs and United States foreign policy. The Polish election in January 1947 he described (Jan. 27) as "a contemptuous indifference to the principles of free government." In a similar vein he later said (Aug. 26) that Poland had been once more "subjected to enslavement by a ruthless and dictatorial power." Having previously advocated (May 28) unrestricted Jewish immigration into Palestine and the establishment of a Jewish national home there, he promptly approved (Sept. 11) the partition plan recommended by the United Nations' special committee.

The foreign aid programs broached by President Truman for Greece and Turkey and by Secretary Marshall for European economic rehabilitation received Dewey's qualified support. The United States was obligated he maintained (Oct. 10), "to see that no American is poorly fed as a bitter result of thoughtless or badly planned generosity." In a major address, he insisted (Nov. 5) that a business-like administration must be provided for the Marshall Plan by creating a special authority under the direction of a bi-partisan board. Moreover, he criticized (Nov. 20) the failure to include China within the program and demanded (Nov. 24) that assistance be given immediately to that nation. The Soviet Union he condemned (Nov. 19) for trying by "a stream of malicious falsehood and calumny" to keep American aid from hungry nations so that they would "fall prey to the cold aggression of totalitarian Russia."

During the last quarter of the year, Governor Dewey endorsed (Sept. 22) a $2,000,000,000 state highway construction program, created (Oct. 3) by executive order a State Food Commission to help meet the food crisis, and approved (Oct. 7) a plan by which veterans could finance new houses with the help of state bonuses. Relief and public welfare, he asserted (Oct. 7), should be joint problems of both public and private agencies; in fact, he contended (Nov. 19) that voluntary contributions for these purposes were essential to protect society against governmental encroachment on individual freedom because "no agency of Government can ever use money so wisely or well as privately managed or sponsored institutions."

JAMES V. FORRESTAL

As the United States' first Secretary of Defense, James V. Forrestal achieved nationwide recognition in 1947. Formerly a presidential assistant and Under-Secretary of the Navy, Forrestal served with distinction as Secretary of the Navy from 1944 until September when he assumed the new defense post created by Congress.

Forrestal defended (Feb. 26, 28) the proposed $4,500,000,000 budget for the Navy because of this country's increasing responsibility to safeguard security of the sea. He spoke out strongly (May 26) for the American type of "democratic capitalism" and the two-party system of government. World peace could better be achieved, he said (June 16), by attacking the basic causes of war than by disarmament.

Although nominated on July 26 to be Secretary of Defense and immediately confirmed by the Senate, Forrestal did not take the oath of office until so directed by President Truman on Sept. 17. In the meantime, he told (Aug. 28) the American Legion national convention that the United States military power must be kept "vigorous, modern, and capable of swift mobilization"; unification of the armed services, while a step in the right direction, must be accompanied by universal military training to attain these goals. His approach to the problems arising from unification, he said, would be "to depend upon the process of orderly evolution and not of disruptive revolution." He considered (Sept. 23) his primary duty was to develop common practices and common policies, but not to concern himself with details of organization.

Forrestal denounced (Oct. 1) as utter nonsense and without historical foundation Russian charges that American big business elements had precipitated wars. In the interest of national defense, he urged (Oct. 9) construction of the Saudi Arabian oil pipeline, proposed (Oct. 22) the preparation of a total mobilization plan, and supported (Nov. 12) the planning of an adequate air-raid warning network. So that military planning could be on a long-range basis, Forrestal recommended (Dec. 3) substituting a "continuous budget" for annual appropriations and ordered (Dec. 21) the new Research and Development Board to submit each year a master plan for military research.

In an attempt to terminate public speculation about his political future, Forrestal announced (Dec. 11) that he could not be "drafted" as a candidate for Vice-President in 1948 and that he had no intention of resigning his Cabinet position.

WARREN R. AUSTIN

Warren R. Austin, since 1931 United States Senator from Vermont, in 1947 held the major United States posts on the United Nations Security Council, Atomic Energy Commission, General Assembly, and Commission for Conventional Armaments, and served as a delegate to the Inter-American Conference in Brazil.

Austin's official actions and public utterances were generally consistent with the policies of his predecessors. For instance, he closely adhered to Bernard Baruch's ideas on the control of atomic energy. Although he opposed changing the Charter requirement for unanimous approval by the permanent members for Security Council action, he insisted that the veto could not be used "to protect an aggressor from the consequences of his crime" (Jan. 16). Furthermore, he believed(Jan. 26) that other sections of the Charter imposed obligations on United Nations members to take steps collectively against threats to peace despite Security Council inaction. Although serious differences of opinion arose on the Security Council in regard to international disarmament and atomic energy control, Austin predicted (Feb. 7) that ultimate agreement would be reached. To guard against misuse of the veto power, Austin pleaded (Aug. 10) for an improvement in international ethical standards.

President Truman's proposed $400,000,000 aid program for Greece and Turkey was defended (March 28) by Austin as a measure designed "to strengthen the United Nations and to advance the building of collective security." Additional proof of the United States' intention not to bypass the world organization could be found, he said (April 10), in the provision that agreements made with Greece and Turkey would be registered with the United Nations. Austin scored (April 18) victories in the Security Council by engineering the rejection of a Soviet proposal to send a special commission to supervise expenditures in Greece under the Truman plan and by securing adoption of his resolution ordering the Balkan investigation commission to leave a subsidiary group in Greece until further Council action. Later, he denounced (June 27) Yugoslavia, Bulgaria, and Albania for supporting guerrilla activity in northern Greece and demanded effective action to prevent Greek border violations.

Under Austin's sponsorship, the Security Council unanimously approved (April 2) placing the former Japanese mandated islands in the Pacific under United States trusteeship. At the special session of the General Assembly in May, he favored establishing a small, neutral committee, without "Big Five" representation, to inquire into the Palestine question.

In order that the United States might give full support to the United Nations and to the preservation of peace, Austin endorsed (March 4) universal peacetime military training and asserted (June 13) that we could not unilaterally disclose atomic bomb secrets until adequate international control had been established.

Soviet delegate Vishinsky's charges of warmongering against the United States were vigorously denied (Sept. 20) by Austin. In turn, he attacked Russian obstructionist tactics and, after expounding at length on freedom of speech (Oct. 23), he induced the General Assembly to reject a Soviet-sponsored resolution demanding suppression and censorship of "warmongers." Likewise, Austin clashed with the Russians over his resolution (Oct. 19) providing for free elections and the establishment of a national government in Korea.

HENRY A. WALLACE

Former Vice President Henry A. Wallace, in 1947, spearheaded the anti-Administration faction of the Democratic party. After threatening an insurgent movement several times unless Democratic leaders changed their policies, he decided at year's end to seek the presidency in 1948 as the leader of a new third party.

President Truman's request for aid to Greece and Turkey marked the start of an almost continuous series of bitter attacks by Wallace upon United States' foreign policy. The "Truman Doctrine," he said (March 13), called for military subsidies to undemocratic governments in the futile hope that American dollars could stop communism; to the contrary, Wallace believed it would spread communism, unite the world against the United States, and bring us nearer to war.

During April, Wallace made a three-week tour of England, France, and the Scandinavian countries for the announced purpose of discovering "those forces that must be united on behalf of peace." While he was abroad, his severe criticism of American foreign policy led to demands in Congress and elsewhere for withdrawal of his passport or legal prosecution. He stressed the need for an understanding with the Soviet Union and proposed that the United States, through the United Nations, make a sizable loan for Russian relief. As one pathway to peace, Wallace suggested a ten-year $50,000,000,000 United States foreign aid program. Two charges he made frequently were that the United States Government was conducting a "Red Hunt" and that the American press was guilty of "the selective use of the truth."

After returning to the United States, Wallace campaigned in May and June through 15 states for the announced purpose of "liberalizing" the Democratic party. During this period, he continued to denounce

American attempts to arm nations outside the Russian sphere. Likewise, he condemned the bi-partisan conduct of foreign relations in the United States as a "Tory coalition," charged that the Administration was "playing politics with the misery of Europe," and claimed that the universal military training measure was the "most warlike" governmental proposal in our history. To restore confidence between the United States and the Soviet Union, he advocated a Truman-Stalin conference in Berlin to settle issues in disagreement. Although he approved (June 22) the principle behind the Marshall Plan, he later criticized (Dec. 30) it as being "based on world division and conflict." His alternative scheme called for the establishment of a rehabilitation fund to be administered by the United Nations, financed by all nations according to their means, and allocated solely on the basis of need.

Domestically, Wallace feared that the United States was becoming the center of world reaction, evidenced by widespread anti-communist talk, the loyalty test for government employees, and the Taft-Hartley Act. As in previous years, he demanded passage of a national aid program for housing, health, and educational purposes, abolition of the poll tax, and establishment of a Fair Employment Practices Commission. In July, he appealed to organized labor and the small farmers to overthrow the reactionary leadership of the Democratic party in the South.

A theme commonly emphasized by Wallace during the fall was that representatives of Wall Street financial interests occupied the key posts in the Truman Administration responsible for formulating foreign policy. His own philosophy he often termed "progressive capitalism," by which he meant lower prices, higher wages, increased production, and improved living standards. In place of the voluntary "eat-less" program, he recommended (Sept. 22) reestablishment of rationing and price controls. In October, he flew to Palestine for a first-hand study of agricultural and political problems there. His impression of Palestine was that Jewish-Arab tension was not as great as had been reported and that partition could be successfully accomplished with little bloodshed.

As early as July 19, a Democratic faction in California began a "Wallace-for-President" drive. Despite numerous warnings that he would leave his party if it continued a policy of "war and depression," Wallace waited until Dec. 29 before making the final break. The Progressive Citizens of America had already urged him to run on a third ticket, but leaders of several strong labor unions opposed such a move. In announcing his candidacy, Wallace said that the new party would stand for a "positive peace program of abundance and security." He called for a United Nations disarmament conference and an international peace force "stronger than the military establishment of any nation." Announcement of his resignation as editor of the *New Republic* had been published the day before.

GEORGE C. MARSHALL

General George C. Marshall, former Army Chief of Staff (1938-45) and special ambassador to China (1945-46), in 1947 became the first high-ranking military officer to serve as Secretary of State in modern times. As chief spokesman for the United States at various international assemblages and as author of the long-range European Recovery Program, Marshall's influence on American foreign relations was unusually large.

When Secretary of State Byrnes resigned early in January, President Truman named Marshall to the post. En route to Washington from his Far Eastern mission at the time of his appointment, Marshall declared in his report that China's salvation depended upon "assumption of leadership by the liberals." Before taking oath of office (Jan. 21) the new Secretary, completely disavowing any political ambition, insisted that he "never could be drafted" for political office.

Early in February Marshall listed more than twenty projects which, in his opinion, required prompt Congressional action. Among the most urgent items were the continuation of international relief, ratification of peace treaties with the satellite nations, adherence to the International Health Organization and the International Refugee Organization, and authorization of the immigration of displaced persons. While pledging his full support to the United Nations, he stated (Feb. 7) that adequate international control of atomic energy must precede world disarmament. Furthermore, he warned (Feb. 22) the American people not to become indifferent to "the long-time dangers to the nation's security."

At the Moscow meeting of the Council of Foreign Ministers (March 10-April 24) Marshall proposed creating a German national council to serve as a provisional government, which would be replaced within a year through a democratic, popularly approved constitution. He also advocated reducing occupation forces, convoking a general peace conference of all the Allied nations, establishing German economic unity, revising German-Polish boundary lines, integrating the Saar with French economy, and concluding a forty-year, four power pact to guarantee German disarmament. On the other hand, he firmly opposed Russian demands for $10,000,000,000 in reparations from current German production and French requests for internationalization of the Ruhr.

After his return from Moscow Marshall disclosed (April 28) that Premier Stalin had expressed confidence that major Russian-United States differences could be compromised. Nevertheless, the Secretary blamed Russia for blocking progress and demanded that European recovery problems be met without delay.

In the field of foreign relief Secretary Marshall left a large imprint. He was instrumental in the framing of President Truman's program to bolster Greek and Turkish economies. Likewise, he proposed (June 5) that aid for European economic rehabilitation be provided on a long-range, integrated basis rather than through piece-meal appropriations. To implement the latter plan he requested European nations to agree jointly upon their requirements and the amounts each could contribute toward the program. If the United States did not provide assistance, he expressed (July 14) fear that Europe would be driven into the Communist orbit.

Charges that imperialism motivated American offers of foreign assistance Marshall denounced (July 1) as a "fantastic misrepresentation" and a "malicious distortion" of the truth. To the contrary, he said (Aug. 15), the United States wants only a free, prosperous, and peaceful world. He warned (September 10) that unless emergency food and fuel were provided Europe by the end of the year, there was danger (Oct. 15) of "disastrous disintegration." Accordingly, he presented (Nov. 10) Congressional leaders a $597,000,000 interim assistance plan for France, Italy and Austria and a four-year program for general European economic rehabilitation. To coordinate American relief operations he recommended appointing a special representative with ambassadorial rank. Administration of the short-term program was delegated (Dec. 26) to the Secretary of State by President Truman.

At the Inter-American Conference in Brazil Marshall insisted (Aug. 2) that only problems of mutual defense and security should be considered. He emphasized that, while the United States had "not lost sight of the economic problems of the Western Hemisphere," nations devastated by war had prior claim to American assistance. On his return to Washington the Secretary described (Sept. 4) the cooperation displayed at the conference as "the most encouraging, most stimulating international action since the close of hostilities."

For seven weeks in the fall Marshall attended the United Nations General Assembly meetings in New York. Before the session began he publicly asked (Sept. 14) the Assembly to provide means of protecting the territorial integrity and political independence of Greece, to find a solution for the Palestine problem, and to admit qualified nations to United Nations membership. To the Assembly itself he proposed (Sept. 17) also that it consider the problems of Korean independence and Security Council voting procedures and that it create a standing, interim committee of all member nations to review "situations and disputes impairing friendly relations."

On November 20 Marshall flew to London for the fifth session of the Council of Foreign Ministers. Before departing he had bitterly castigated (Nov. 18) the Russian government for waging "a calculated campaign of vilification" against the United States. Despite his hopes for progress, the three-week meeting proved to be fruitless. Marshall clashed with Molotov over such issues as the Polish-German frontier, economic integration of the Saar with France, participation of all the Allies in the peace conference, German economic unity, Russian reparations demands, and removal of German assets, and terms of the Austrian treaty. In proposing adjournment he placed responsibility for failure squarely upon the Soviet Union. Soon after returning to Washington Marshall told (Dec. 19) the nation that until healthy, vigorous governments were restored in Europe, "it does not appear possible that paper agreements can assure a lasting peace."

Secretary Marshall's stand on a number of other issues is worth noting. To promote world trade he favored (May 17) reaching an agreement on the International Trade Organization charter and opposed (May 29, June 12) placing a tariff on United States wool imports. He supported (May 22) transferring United States military and naval equipment to Latin-American nations and approved (June 25) giving Italy thirty-one American merchant ships. At Oxford University (where he was awarded an honorary degree) Marshall stressed (Nov. 22) the value of Anglo-American cooperation, which, he reassured (Dec. 12) a London audience, would not be endangered by the differences between British socialism and American capitalism.

In Far Eastern affairs Marshall decided (April 11) to proceed independently in Korea after the Joint Commission failed to establish a provisional central government, but he later agreed (May 2) to resume negotiations with the Soviet Union. For China he proposed (Nov. 12) a sizable aid program to begin in April, 1948. After the Soviet Union rejected (July 22) his suggestion that the Japanese peace treaty be written by the eleven nations represented on the Far Eastern Commission, Marshall likewise turned down (August 15) Russian proposals that only the United States, Great Britain, China, and the Soviet Union participate in the peace conference.

Although Marshall made no drastic reorganization of the State Department, some of its operational policies were improved and several personnel changes in key posts were made. Ten employees, dismissed (June 23) as "potential security risks" by the Secretary, were refused (Nov. 5) a departmental hearing because it would necessitate disclosing highly confidential information. Marshall promised, however, that formal hearings would be granted in such cases "wherever possible." Several times he appealed to Congress to appropriate funds requested for the State Department's international information and cultural activities, including the "Voice of America" broadcasts. State Department plans to take over administration duties in the occupied areas abroad were "indefinitely postponed" by Marshall in October.

EARL WARREN

Governor Earl Warren, the first California chief executive to win both the Republican and Democratic primary elections, in 1947 began his second four-year term and announced his candidacy for the 1948 Republican presidential nomination.

In his inaugural address Warren recommended (Jan. 6) a balanced budget, adequate maintenance of educational and other public institutions, and a statewide system of health insurance. Later he appealed (Jan. 13) to the legislature to enact higher gasoline taxes for the improvement of California's "congested, obsolete" highways, and he approved (Aug. 4) state laws banning secondary boycotts and jurisdictional strikes.

Contrary to other Republican leaders, Warren opposed (May 10) reducing Federal taxes until the national debt had been substantially lowered. At the annual Governors' Conference he objected (July 14) to a suggestion for eliminating tax duplication through the withdrawal of the Federal Government from the excise tax field and the abandonment by the states of income taxes, because he feared it might undermine the stability of state revenues and would be disadvantageous to the western states. However, he believed (Dec. 11) that a national agency should be created to survey and help rehabilitate American cities that were over-expanded and "disabled" because of the war.

In order that the United States be fully prepared against any future aggression, Warren advocated (July 29) universal military training. He warned (Sept. 11) that unless we were strong, Europe and our own nation would be open "to the inroads of international gangsterism." While he agreed that the United States should provide assistance under the Marshall plan, the California Governor wanted (Dec. 13) the amount for any country to be based not only on need but on such factors as its willingness to live peacefully and cooperatively and to attempt its own rehabilitation.

Despite frequent assertions that he was not a presidential candidate, Warren consented on Nov. 13 to the entering of his name in the California preferential primary. To set at rest speculation that he might accept second place on the Republican ticket, an idea which had been furthered by Governor Dewey's acclaiming (June 7) him a "scientist" in government and politics, Warren denied he was interested in the Vice-Presidency.

MRS. FRANKLIN D. ROOSEVELT

Again in 1947 Mrs. Franklin D. Roosevelt gained fame and praise as the foremost woman spokesman in the United States on world affairs. In addition to her official duties as delegate to the General Assembly and chairman of the Human Rights Commission of the United Nations, she continued to impress on the nation her ideas and opinions through her newspaper column, periodical writings, and frequent speeches.

Under Mrs. Roosevelt's chairmanship the Human Rights Commission in meetings at Lake Success and Geneva was able to draft an international "bill of rights" which it submitted to member nations for consideration. As a member of the General Assembly's Social, Humanitarian, and Cultural Committee she was effective in working for an extension of United Nations social welfare work, especially among war orphans and handicapped children, and in appealing for free speech and press throughout the world. In her reply to Soviet attacks on the "warmongering" activities of United States newspapers, she admitted (Oct. 6) that under a free press system some journals may abuse their privileges, but pointedly added that "a controlled press is like an egg, if any part of it is bad, the whole is bad." Moreover, she accused (Oct. 24) the Russian press of distorting American statements and conducting a propaganda campaign against the United States.

On numerous occasions Mrs. Roosevelt advocated the cause of the United Nations. The American people, she believed, were not thoroughly enough acquainted with its work nor sufficiently convinced of its vital role in maintaining world peace. Accordingly, she instituted (Oct. 5) a series of nation-wide broadcasts each week to clarify the United Nations' organization and operations. Moreover, she proposed (Aug. 2) that Congress should be represented at United Nations meetings. Although she favored (Jan. 26) giving United States' aid to stricken peoples throughout the world, Mrs. Roosevelt supported (May 15) modifying the Greek-Turkish relief program to permit United Nations' intervention. She approved both the bill to admit displaced persons to the United States and the plan to partition Palestine.

THE YEAR IN CONGRESS

By Mary Sumner Benson
Assistant Professor, Milwaukee-Downer College

ORGANIZATION AND COMPOSITION

The Eightieth Congress convened Jan. 3, 1947 and adjourned July 27. Called back into session by President Truman, it reconvened on Nov. 17. Adjournment took place Dec. 19. The 1946 election had brought a party reversal. In the new Congress, the Senate contained 51 Republicans and 45 Democrats. The House had 245 Republicans, 187 Democrats, and one American Laborite. There were seven women members in the House. Senator Arthur Vandenberg was chosen president pro tempore of the Senate, and Joseph W. Martin, Jr., Speaker of the House. The majority leader in the Senate was Senator Wallace White, with Senator Alben Barkley as minority leader. In the House of Representatives Charles A. Halleck and former Speaker Sam Rayburn were selected as majority and minority leaders, respectively.

The Senate had difficulties in organization. Theodore G. Bilbo of Mississippi, who had served two terms as senator and had been chosen for a third term, had during the fall of 1946 been investigated by the Senate Committee on Campaign Expenditures on charges of responsibility for barring Negroes from the polls. A minority of the Committee had recommended that he not be permitted to take his seat. A Senate War Investigation subcommittee had found that Bilbo had accepted gifts from war contractors and had violated the Hatch Act. It recommended that the Senate take appropriate action. It was decided to seek to disbar him by a majority vote. Since his name came second on the list of Senators elected in 1946, the Republicans did not have a majority when his name came up. A deadlock arose which threatened to delay Senate organization. On Jan. 4, however, it was announced that Bilbo was seriously ill and in need of an immediate operation. It was, therefore, agreed to permit his credentials to be laid on the table without prejudice and without action until he had recovered. Senate organization, therefore, proceeded. Bilbo died later in the year so that the question was never reopened.

This was the first Congress to meet after the passage of the 1946 Reorganization Act which reduced the number of Senate standing committees from 33 to 15 and the House committees from 48 to 19. There were numerous subcommittees. In April the number had reached 146. In the Senate the special War Investigation Committee was continued by a vote of 49 to 43 with a proviso that it could not carry its inquiries into foreign countries or investigate "present" situations. The Senate also voted to continue its special committee on Small Business. There were several other select committees and some joint committees.

In November, when the session was resumed, one senator and seven representatives elect took their seats for the first time.

COURSE OF LEGISLATION

As the session opened, Congress was particularly concerned with labor legislation, tax reduction, and problems of the budget. Since these were highly controversial matters legislation proceeded slowly. Hearings on the confirmation of David E. Lilienthal as chairman of the Atomic Energy Commission occupied much of the time of the Senate Atomic Committee in the early part of the session. Then the request for aid to various European countries and the bill providing $400,000,000 for Greece and Turkey caused attention to shift to foreign affairs. These bills were passed in May as was the portal-to-portal pay bill. In June the first tax reduction measure was passed and vetoed. Four days later the Labor Management Act was vetoed. The veto was promptly overridden. Meanwhile there had been no decision on a legislative budget for the fiscal year beginning July 1. Practically every appropriation measure was the subject of extended hearings and compromises. The treaties with Italy and the satellite states were ratified in June. Rent controls were extended before the June 30 expiration date.

Most of the major appropriation bills were still incomplete when the fiscal year ended, and temporary provision had to be made to insure continued operation of various departments and agencies. Under the Reorganization Act of 1946, adjournment was to take place by July 31 unless there was an emergency. July, accordingly, was a crowded month. The remaining appropriation measures were passed, as was the defense bill establishing over-all unification of the armed forces. A second income tax reduction bill differing from the first only in its effective date was passed and vetoed. The bill altering the presidential succession was approved. Altogether there were over 200 bills awaiting the President's signature on July 27 as Congress adjourned, but many of them were routine measures. Generally considered as major accomplishments of the session were the Defense Act, the Labor Management Act, the Portal-to-Portal Pay Act, the Foreign Relief Act, Aid to Greece and Turkey, Rent Control Extension Act, War Powers Act, and the provision for payment of Veterans Terminal Leave Bonds. Tax Reduction and the Science Foundation measures had been effectively vetoed. Action was not completed on the bill for admission of displaced persons, the formal authorization for continuance of the State Department's cultural and information program, the program for hemisphere defense, nor on universal military training. It was estimated that the House had passed approximately 1,100 bills and the Senate about 800; 519 became law and 32 were vetoed.

Congress had adjourned subject to recall by the President or by its own presiding officers. This led to some discussion as to the nature of the session which reconvened Nov. 17 but it was rather generally considered as a special session. President Truman had asked consideration of emergency aid to France, Italy, and Austria, and the taking of anti-inflation measures at home. The first measure was passed with some reduction in the sum asked and with the addition of a limited amount of aid for China. A comparatively mild economic act wa passed lacking many of the control which had been requested. The specia session also received the details of th proposed European Recovery Program. It was expected that thi would receive early consideratio when the second session began Jan. 1948.

APPOINTMENTS

Gen. George C. Marshall wa unanimously confirmed as Secretary

State immediately after the Senate received his nomination on Jan. 8, 1947. Other confirmations in the field of foreign affairs were those of Warren R. Austen as United States representative to the United Nations Security Council and the Atomic Energy Commission of the U. N., O. Max Gardner as Ambassador to Great Britain, Mrs. Eleanor Roosevelt as a member of the U. N. Human Rights Commission, and Willard E. Thorp, Assistant Secretary of State, as assistant representative in the U. N. Economic and Social Council. Lewis Douglas was confirmed as Ambassador to Great Britain, replacing Max Gardner who died before assuming office. The nomination of Francis Biddle as representative to the U. N. Economic and Social Council was withdrawn by President Truman at Biddle's request after much opposition had been expressed.

Kenneth C. Royall was confirmed as Secretary of War in July. After the creation of the post of Secretary of Defense, James Forrestal was approved as the nation's first Secretary of Defense. Under Secretary of State Clayton was confirmed as Chairman of the European Economic Commission. Gen. Lewis B. Hershey received approval as director of the Office of Selective Service Records.

Frances Perkins received approval as member of the Civil Service Commission, Frank Creedon as Housing Expediter, Michael Foley as National Housing Administrator, and Joe B. Dooley as Federal judge for the Northern District of Texas. This last approval followed six months of delay. The nomination was approved by the senior senator from Texas and opposed by the junior senator.

One of the major struggles over an appointment was that of Gordon R. Clapp as chairman of the Tennessee Valley Authority. His name was presented in January. He was opposed particularly by one of the senators from Tennessee on charges that, as T. V. A. personnel director, he had permitted employment of well known Communists. His approval was refused 7 to 5 by the Senate Public Works Committee. President Truman then renewed his endorsement. He was finally confirmed on April 25 for the remainder of the term of David E. Lilienthal.

In December Jesse M. Donaldson was confirmed as Postmaster General and Carl R. Gray, Jr. as Veterans Administrator. The recess appointments of Abe Murdock and J. Copeland Gray to the National Labor Relations Board and of Robert N. Denham as general counsel for the Board were also confirmed.

ATOMIC ENERGY

On Jan. 31, 1947, the Atomic Energy Commission filed its first semi-annual report with Congress. This was chiefly a list of present activities, an outline of future procedures and a list of facilities taken over from the Manhattan district. None of the five men who signed the document had as yet been confirmed by the Senate. Discussion on confirmation centered about David E. Lilienthal as chairman of the Commission. He was named to the post by President Truman Oct. 28, 1946. A large number of witnesses were summoned, chiefly at the request of Senator McKellar of Tennessee. After six weeks the Senate Committee on Atomic Energy voted 8 to 1 to approve confirmation of Lilienthal and also, by varying votes, approved confirmation of Lewis L. Strauss, William W. Waymack, Robert F. Bacher and Sumner T. Pike as the other members of the Commission and Carroll L. Wilson as general manager for the Commission. After some debate from the floor the Senate voted 50 to 31 to confirm Lilienthal. Approval of the other appointees followed.

BUDGET AND TAXATION

Financial affairs were brought to the attention of the new Congress when President Truman on Jan. 8, 1947, made his report to Congress under the Employment Act of 1946. In this he suggested that taxes continue at war time levels. Two days later his budget message reached Congress. This presupposed that income tax rates would be held at their current level and provided for expenditures of $37,528,000,000 with revenues estimated at $37,730,000,000. Discussion began at once, for the majority party was pledged to reduce income taxes and to maintain a balanced budget. The presidential estimates included: $7,343,000,000, Veterans; $3,510,000,000, International Affairs; $11,081,000,000, Army and Navy; $5,000,000,000, Interest on National Debt; $645,000,000, Cost of Foreign Occupation; and $10,000,000,000, General Operations of Government. The President opposed reduction of income and excise taxes.

The Seventy Ninth Congress had voted for a new method of budgetary procedure. The budget was referred to the Joint Congressional Committee made up of 102 members from the Senate and House Appropriations Committees, the Senate Finance Committee, and the House Ways and Means group. A subcommittee of five members from each of these groups was named to study the budget in detail. The Joint Committee was to report a legislative budget by Feb. 15, 1947. On Feb. 11, the subcommittee voted to cut the presidential budget by $6,000,000,000 which it was thought would make possible a 20 per cent personal income tax reduction and still leave $3,500,000,000 for payment on the national debt. This was based on an assumed revenue of $39,100,000,000 for the 1948 fiscal year. On Feb. 14, the Joint Committee voted 50 to 22 for the reduced budget. There was much excitement and various compromise measures were proposed and defeated. The resolution went to Congress as the subcommittee had drafted it. On Feb. 20, the House voted 239 to 159 for the $6,000,000,000 reduction which put a "moral" ceiling of $31,500,000,000 on Federal spending. The Senate voted Feb. 26 to cut the presidential budget by $4,500,000,000. The vote of 51 to 33 was more or less bipartisan. Two days later the Senate voted unanimously for $2,600,000,000 payment on the national debt. This was later increased to $3,700,000,000 by adding funds from the disposal of war surplus property. The second resolution limited national spending to $33,000,000,000. The bill then went to conference with the House, but a formal meeting of the conference committee ended in deadlock, and no agreement was ever reached. It was apparent that the financial purposes of the Legislative Reorganization Act of 1946 had not been carried out.

The proposals for tax reduction led to struggles over cuts in appropriations and unprecedented delay in passing such measures. Only one major bill was ready for the presidential signature by July 1 when the new fiscal year began. This necessitated authorizing government agencies to continue expenditures at the old rate or the proposed one, whichever was lower, until the bills were adopted and led to some delays in the issuing of salary checks. When the session ended, Congress had allowed approximately $34,863,142,995 of the $37,640,566,095 asked in original and supplemental appropriations. This does not give an absolute picture of the difference because some of the bills included funds for expenditure after 1948. Claims and counter claims on savings were rife. The approximate amounts of the regular appropriation bills were as follows:

Treasury—Post Office	$3,216,500,000
Interior	194,587,000
Navy	3,269,000,000
State, Justice, Commerce departments and Judiciary	551,176,000
Agriculture	613,046,000
Labor—Federal Security	1,674,158,000
War Department—military functions	5,482,500,00
Independent Offices	8,188,823,00
Legislative Establishment	55,000,00
War Department—civil functions	502,123,00
District of Columbia supply	95,500,00
Government Corporations	35,040,00

Important also were some of the deficiency and supplemental measures The First Deficiency Appropriatio provided $2,830,000,000, of which $1 800,000,000 was for Veterans' Administration, $465,000,000 for Army pay, an $135,000,000 for grants to states unde the Social Security program. The First Supplemental Appropriation Act of $1,658,802,197 included the $400,000,000 for Greek-Turkish aid and $332,000,000 for relief to populations in areas occupied by the United States.

In the Agricultural Bill $150,000,000 for soil conservation and $65,000,000 for school lunch programs were included after much discussion. In the measure for the State, Justice, and Commerce departments, serious controversy arose over the appropriation for the Cultural activities of the State Department, particularly the "Voice of America," the overseas broadcast. The Department had asked $31,000,000 for the office of International Information and Cultural Affairs. The House Appropriations Committee objected that the foreign program had not been authorized by specific law, was not in accord with American precedents, and had been badly handled. Secretary of State Marshall and General Bedell Smith, ambassador to Russia, appealed for continuance of the program. A bill to give specific authorization passed the House but was blocked in the Senate; $12,400,000 was finally allotted for the purpose of which over $6,000,000 was for the "Voice of America."

One of the conspicuous features of the majority program was H. R. 1, the income tax reduction bill. This passed the House on March 27, 1947 by 273 to 137. The Senate passed an amended form of the bill May 28 by a vote of 52 to 34. After conference, the measure provided for 30 per cent cut for persons with net taxable incomes of $1000 or less. The reduction then dropped by degrees to 20 per cent cut on incomes from $1,395.83 to $136,720. Above that, reductions were smaller. The conference report passed the House 220 to 99 and the Senate 48 to 28. The President vetoed the measure June 16, stating that this was the wrong type of reduction at the wrong time and that it would increase inflation, that the country had ample funds for expansion, and that our international responsibilities and other obligations growing out of the war made tax reduction unwise. This particular measure, he thought, was inequitable, and he recommended planning for a thorough revision of the tax structure. The House voted 268 to 137 to override the veto. This lacked two votes of the two-thirds majority needed, and the veto was sustained. A week later the bill was reintroduced with the effective date changed from July 1, 1947 to Jan. 1, 1948. It passed the House by 302 to 112 and the Senate by 60 to 32. It was vetoed on July 18. The veto was promptly overridden in the House 299 to 108 but sustained in the Senate where the vote was 57 for overriding and 36 against, five votes short of the two-thirds majority.

A bill to reduce immediately excise taxes on fur, jewelry, luggage, and liquor was introduced at the beginning of the session. These taxes would have dropped automatically July 1 because of the President's proclamation of the ending of hostilities on Dec. 31, 1946. Instead, a bi-partisan bill was reported by the Ways and Means Committee to peg these taxes and those on railroad tickets and long distance telephone calls at war time rates. This passed both houses with certain modifications as to fur trimmed garments and tickets for foreign travel.

The Social Security tax was pegged at its present level of one per cent until Jan. 1, 1950. It is then to rise to 1½ per cent for 1950 and 1951 and to 2 per cent in 1952. Temporary increases in Federal aid to certain needy persons authorized in 1946 were continued until 1950.

In a final appropriation bill at the end of the reconvened session, $540,000,000 was voted for emergency relief abroad. Of this amount, $522,000,000 was for France, Italy, and Austria, the remainder for China. The sum of $340,000,000 was appropriated for the remainder of the fiscal year in American occupied areas; $500,000 was voted for a relief fund for the Navajo and Hopi Indians. A $2,000,000 fund had been authorized for this shortly before. Supplemental appropriations of $31,939,000 were made for four major reclamation projects in the western states.

DEFENSE

On Feb. 26, 1947, the President sent to Congress a proposal for a National Defense establishment. The bill represented compromise views of the Army, Navy, and Air Forces. The problem had been the subject of many hearings in the Seventy Ninth Congress. The House referred the bill to the Committee on Executive Expenditures. The Senate after some discussion over jurisdiction referred it to the new Committee on the Armed Services created by the Congressional Reorganization Act of 1946. Extensive hearings were held by both committees. Secretary of the Navy Forrestal, General Eisenhower, General Spaatz, Admiral Nimitz, Secretary of War Patterson, and Admiral Sherman all testified in favor of the measure. General Vandergrift, Marine Corps Commandant, Admiral Zacharias, and Admiral King opposed it as originally presented. The latter suggested instead the creation of a National Security Council. The Senate committee made some modifications in the original bill, especially those protecting the status of the Marine Corps and of naval aviation. The measure passed the Senate by voice vote July 9 without amendment. A substantially similar measure was approved by the House ten days later. Differences were quickly resolved in conference.

President Truman signed the measure July 26 and immediately nominated James Forrestal as Secretary of Defense. The Senate confirmed the appointment by voice vote just before adjournment. The bill left the Army, Navy, and Air Force each with its own department and secretaries, not of cabinet rank, but coordinated them under a Secretary of Defense. The President was to preside over a National Security Council made up of the heads of the units. The Council was to appraise the objectives, commitments, and risks of the United States in relation to military power and to make recommendations. Under the Council, a Central Intelligence Agency was to assemble and correlate intelligence relating to national security. This body was not given law enforcement powers nor internal-security functions. The heads of the three units were also to form the National Military Establishment under the Secretary of Defense, a Cabinet member. Functions were assigned to each of the three departments, and special provisions assured the continued integrity of the naval aviation service and Marine Corps. The Secretary of Defense was to exercise general direction and establish policies and programs, but the service secretaries might also report directly to the President. The Secretary of Defense was to be either a civilian or one who had not been a commissioned officer in active service for ten years.

A few days later a bill was approved which changed the methods of promotion for both Army and Navy. Qualifications for promotion were to be set by boards of officers, and failure to meet the standards set twice in succession would automatically drop an officer from the service. The number of four-star officers in peacetime was restricted to five in the Army, four in the Navy, four in the Air Force, and one in the Marine Corps. The President's Chief of Staff might also be a four-star officer while actually serving in that post. Limitations were also placed on the number of one-, two-, and three-star officers.

The Selective Service Act was to expire on March 31, 1947. Four weeks earlier President Truman sent Congress a message stating the needs of the Army and Navy in personnel for the fiscal year 1948, expressing the hope that these could be met by voluntary enlistments and recommending that no extension of Selective Service be made at that time but that the Army and Navy be permitted extra civilian personnel if necessary to balance any shortage of enlisted personnel. The needs of the Army were stated as 1,070,000 men, which included the Air Force, and those of the Navy as 571,000 including the Marine

Corps. This was shortly followed by a presidential request for immediate liquidation of the county offices of selective service. The Senate showed great reluctance to permit the system to lapse completely and passed a bill which continued the boards in nominal service against an emergency. It created the office of Selective Service Records which was to assemble such records for permanent storage in state capitals. This office was to liquidate the Selective Service system. The measure as modified by the House was signed by the President March 31. He immediately named Major Gen. Lewis B. Hershey, former director of Selective Service, to be director of the new office.

The President again asked Congress to consider universal military training. He submitted a report from his civilian advisory commission recommending this. No action was completed on the matter.

A bill for Inter-American Military Cooperation similar to one presented to the Seventy Ninth Congress was submitted by the President and was urged before the House Foreign Affairs Committee by Secretary of State Marshall and Secretary of War Patterson. Action was not completed.

Other measures extended indefinitely the volunteer enlistment age of 17 years for the Army, established an Army Nurse Corps with a total strength of six for each 1,000 of personnel in the regular army and reorganized the Nurse Corps of the Navy on the same basis. Pay of cadets and midshipmen at the service academies was increased to $936 annually. The law for appointing 25 midshipmen at large was changed to provide for the appointment of an additional 60 from enlisted men of the Navy and Marine Corps and 160 from the Naval and Marine Corps.

Construction of submarines for experimental purposes at a cost not to exceed $30,000,000 was authorized. Provision was also made for Congressional study of the means of building up an adequate rubber supply for defense purposes. It was provided that, until permanent legislation was passed, no synthetic rubber plant costing the Government more than $5,000,000 should be disposed of.

Racially inadmissible wives of members of the armed services married before Aug. 21, 1947 were permitted to enter the United States for permanent residence if they could meet other qualifications.

FEDERAL EMPLOYMENT

A measure signed July 7 created a 12-member commission to investigate all agencies of the Government and to report to the next Congress. The commission was to study limitation of expenditures, duplication of functions, abolition of unnecessary activities, and definition of the work of Federal agencies. The commission was to be bi-partisan, and six of the members were to be chosen from private life. Four were to be appointed by the President, four by the Speaker of the House, and four by the President of the Senate.

FOREIGN AFFAIRS

Peace treaties with Italy, Bulgaria, Hungary, and Rumania were sent to the Senate early in the year. Secretary of State Marshall and former Secretary Byrnes appeared before the Foreign Relations Committee in March, 1947 and recommended prompt ratification as necessary for national security. They came before the committee again on May 6 and urged speed. Secretary Marshall also read a letter from President Truman favoring action on the treaties. Three days later the committee approved them without reservations. On June 5, the Senate ratified the Italian treaty by a vote of 79 to 10 and the others by voice vote.

On April 8, President Truman withdrew 19 treaties which had been in the files of the Foreign Relations Committee for years—in one instance since 1910. Among these agreements was the treaty of 1932 with Canada for the completion of the St. Lawrence deep sea waterway.

On Dec. 8, the Senate ratified 72 to

1 the Inter-American Treaty of Reciprocal Assistance which provided for action by all contracting nations against armed attack on any American nation, for consultation in case of aggression and for peaceful procedures in settling disputes within the hemisphere.

On Feb. 24, President Truman sent a message asking authorization of United States membership in the International Refugee Organization the constitution of which had been signed by our representative to the United Nations. Participation was approved by the Senate March 25 with a rider added by the Foreign Relations Committee barring any softening of our immigration laws. The House passed the measure June 26 with some alterations to take care of the interim expected between the termination of UNRRA and the beginning of the IRO. As completed, the bill authorized a maximum contribution of $73,500,000 for the organization, with monthly payments to a provisional commission pending formal establishment of the organization.

On July 7, the President asked Congress to authorize the admission of a "substantial number" of displaced persons, especially those from eastern European countries who were unwilling to return to their former homelands for fear of political persecution. The message emphasized that this was not a request for general revision of immigration policies. No action was completed before adjournment although hearings had already been held on such a bill by a House Judiciary Subcommittee.

A trusteeship agreement authorizing United States administration of the Marshall, Caroline, and Marianas Islands, formerly mandated to Japan, was approved by the United Nations Security Council in April. In July, President Truman asked enabling legislation to permit him to put this into effect. It was approved promptly by both houses. The area will be known under United States administration as the "Territory of the Pacific."

The President was later authorized to enter an agreement with the United Nations for the establishment of permanent UN headquarters in this country.

President Truman asked for revision of the neutrality laws to give him discretionary power through a licensing plan to control exports of arms, but no action was completed in this matter.

The question of "cultural diplomacy" arose in connection with the appropriations for the State Department. A bill authorizing the department to conduct a foreign information and educational program to promote understanding of the United States abroad and for this purpose to use short wave radio broadcasts, news bulletins, publications and other media, passed the House 272 to 97. It was approved by members of the State Department and the Foreign Service. The Senate Foreign Relations Committee approved the measure, but action was not completed in the Senate. Some funds were made available for the work in the appropriation for the State Department but much less than had been requested. A special investigation of the foreign information program was voted by the Senate July 26. The House Foreign Relations Committee later decided to cooperate in this.

AID TO EUROPE AND CHINA

Of major importance in foreign affairs were the measures for aid to Europe, of which there were several which had far reaching effects on our foreign policy. On Feb. 21, 1947, President Truman asked for $350,000,000 for relief in liberated countries abroad. This was to be controlled by the United States rather than by an international agency. This was proposed in anticipation of the ending of UNRRA and was to be used for medical supplies, food, and items aiding in the production of foodstuffs. Hearings were held promptly, and the President conferred with Congressional leaders in a closed meeting at the White House. Action was delayed by the subsequent proposal for aid to Greece and Turkey. The measure underwent considerable amendment in the House Foreign Affairs Committee. This was chiefly to provide additional supervision. The House itself on April 30 voted 333 to 66 to pass the measure with the aid cut to $200,000,000. There was also a proviso that countries receiving aid must agree to the watching of distribution by United States missions all the way down to the local communities and that 90 per cent of the relief supplies must be purchased in the United States or its possessions. Two weeks later the Senate passed the bill 79 to 4 with the original sum intact. After conference, both houses agreed to the $350,000,000 with a proviso that this should include the U. S. share of the United Nations International Children's Fund; $5,000,000 was earmarked for transportation of relief supplies donated voluntarily. The measure specified that aid should not go to countries other than Austria, Greece, Hungary, Italy, Poland, China, or the Free Territory of Trieste. Provision was made for identifying all relief supplies so that the donor should be known. The bill was signed May 3. The appropriation bill in July cut the sum to $332,000,000, omitting funds for Poland and Hungary.

On March 3, 1947, President Truman appeared before a joint session of Congress and asked for aid for Greece and Turkey. It was stated that this was necessary if Greece was to remain a free nation. It was made part of a policy of helping free people to maintain their free institutions and national integrity against aggression. The sum asked was $400,000,000 for the period ending June 30, 1948. A tentative "deadline" of March 31 was suggested for passage. Action began promptly and extensive hearings took place. Under Secretary of State Acheson, Under Secretary of State for Economic Affairs Clayton, Secretary of War Patterson, Secretary of the Navy Forrestal, and others appeared before the committees of both houses, and the State Department submitted many documents dealing with conditions in the Near East. The measure was reported out by the Senate Foreign Relations Committee April 3 with certain modifications to prevent by-passing of the UN. The bill passed the Senate 67 to 23 on April 22 after 11 days of debate. On May 9, it passed the House 287 to 107. Slight differences in the two versions were quickly adjusted. The bill not only authorized the $400,000,000 but provided for the use of United States civilian and military personnel in those countries, the latter in an advisory capacity only. Pending the passage of an appropriation bill, $100,000,000 was made available immediately through the Reconstruction Finance Corporation. Other provisions safeguarded the utilization of the assistance. It was provided that the President should withdraw aid at any time if requested to do so by the governments of Greece or Turkey, if the Security Council or General Assembly of the United Nations found that UN action makes its continuance unnecessary or undesirable, if he found that its purposes had been substantially accomplished or could not be accomplished, or if he found that the contracting nation was not carrying out its agreement. Quarterly reports were to be made to Congress on the progress of the aid. The formal appropriation was made late in July in the same measure with the $332,000,000 for general foreign aid. With these, was joined an appropriation of $600,000,000 for relief to the people of countries occupied by the United States.

Before Congress adjourned the House provided for a special committee on foreign aid headed by Representative Eaton, chairman of the Foreign Affairs Committee and Representative Herter of Massachusetts. The committee of 19 members was authorized to travel wherever it seemed desirable and to investigate foreign affairs. It was to study the drain of foreign relief upon the United States, the needs of countries abroad, our resources and those of other countries which might be used to meet these needs, and to investigate agencies which might be used in relief. The membership was drawn from a number of House committees which might be concerned with some aspect of foreign aid. The committee was to report by March 1948. At the same time the House Foreign Affairs Committee had subcommittees authorized to visit various geographical areas and to report on conditions found in them.

Before the July adjournment members of both houses were much concerned about the European situation. Secretary of State Marshall had a long executive session with the Senate Foreign Affairs Committee in July and apparently discussed various aspects of the reconstruction of Europe. The problem was studied by members of Congress after adjournment. When President Truman called Congress back into special session, he named emergency aid to France and Italy and additional funds for occupied areas as important problems which could not wait until January. He also spoke of the need for beginning consideration of the long-range European recovery program. Congressional committees began hearings on these proposals before Congress reconvened. Secretary Marshall and Under Secretary Lovett of the State Department, Ambassador Douglas, Secretary of Commerce Harriman, all appeared in favor of the proposed interim aid measure which would have provided $597,000,000 for aid to France, Italy, and Austria until March 31, 1948. The money was to be spent for food, coal, petroleum, cotton, fertilizer, seed and medical supplies. Over half of this was for food.

Secretary Harriman explained the effects which sending the supplies would have on our domestic economy and the necessity of a food conservation program in this country. The House Select Committee on Foreign Aid also released seven reports of its investigations into conditions in France and Italy and in the key industries here which might be affected. The industries were grain, fertilizer, petroleum, steel and coal. The President in opening the session asked again for the emergency aid with $42,000,000 going to Austria, $227,000,000 to Italy, and $328,000,000 to France. On Dec. 1, the bill passed the Senate 83 to 6 with some amendments generally acceptable to the measure's sponsors. The bill did not reach the floor of the House until after the passage of the Senate version. There it was amended by provisions designed to lessen the impact of the aid on American economy, and the amount of assistance was cut to $590,000,000, of which $60,000,000 was to be for aid to China.
The House accepted this by voice vote
Dec. 11. Two days later conferees
agreed on a compromise bill which
was sent to the President Dec. 15
This authorized $597,000,000 in aid
France, Italy, Austria, and China were
listed as recipients but it was provided
that any funds for China might be
used for the other countries named to
the extent that aid for China was sup-
plied under other acts. Provision was
made for a wheat reserve of 150,000,-
000 bushels for the United States, but
the President could lower this if he
felt that the wheat prospectus at home
justified it. The President was also
authorized to terminate aid to any
country if he found that unde
changed conditions it was no longe
consistent with the national interest
No more than five per cent of th
supplies sent to any country were t
be "incentive goods" such as tobacc
intended to stimulate workers to pro
duce. The Reconstruction Financ
Corporation was authorized to mak
$150,000,000 available without waitin
for an appropriation bill. The Com
modity Credit Corporation was au
thorized to provide the relief progra
with any surplus supplies purchase
under the price control program. I
was also provided that procuremen
might be made from foreign sourc
whenever the cost delivered to the re
cipient country would be less than th
cost delivered from the United State
Ten per cent of the funds might b
used to purchase abroad commoditi
in short supply in the United Stat

at a delivered cost higher than if from the United States. As far as possible petroleum was to be procured from sources outside the United States.

Countries receiving aid were to enter into agreements with this country to use the commodities supplied efficiently and to take economic measures necessary for a self sustaining economy. Full publicity was to be given to the source and amounts of the aid furnished. Full information on the material received and the uses to which it was put was to be supplied by March 31, 1948 or as soon as possible thereafter. Representatives of the press and radio of the United States were to be permitted to observe and report on the carrying out of the program. The President was to report regularly to Congress on the operations under the act. The program was to terminate March 31, 1948. President Truman signed the measure Dec. 17.

An appropriation bill passed on the final day of the session gave $540,000,000 for carrying out the interim aid measure. It designated $18,000,000 for China. The same measure provided $340,000,000, a cut of $150,000,000 from the amount requested for occupation and relief costs in Germany, Japan, and Korea. The President signed the measure at once.

Long range aid to Europe had been suggested before the July adjournment but a presidential request on it awaited the results of the conference of western European nations in Paris during the summer and the reports of several committees named by the President. The Secretary of State and others made reference to the plan at the committee hearings before Congress reconvened and Secretary Marshall gave a summary of the general aspects of the plan. On opening Congress, the President made brief reference to the long-range plan. In one of its early reports the House Committee on Foreign Aid suggested that European nations could help in part to pay for United States assistance by giving this country access to strategic materials in various areas, thereby securing oil, iron, and other supplies for stockpiling.

On Dec. 19, just before Congress adjourned, President Truman sent a message outlining the European Recovery Program, asking for authority to spend $6,800,000,000 in the first 15 months of the plan. In the proposed bill, $17,000,000,000 would be authorized as the total expenditure. There would be an administrator at a salary of $20,000 and a deputy administrator in charge with 10 top rank assistants and 50 others with $10,000 salaries. There would also be a special ambassador in charge of the European phase of operations. The plan was to run for approximately four years. It was hoped that passage would take place in time to permit beginning operations by April 1, 1948. Some of the aid was to be provided as loans and some as gifts.

HOUSING

A long-range housing bill, similar to one passed by the Senate in 1946, was introduced in the Senate in March. It provided for coordination of existing housing agencies under a permanent National Housing Commission and for various steps to facilitate construction of 15,000,000 homes in the next 10 years. Action was not completed on this bill.

In May, President Truman submitted Reorganization Plan No. 3 which set up a Housing and Home Finance Agency to coordinate the work of the Home Loan Bank Board, Federal Housing Administration and the Public Housing Authority, and a National Housing Council with representatives from the three groups just named and from the Veterans' Administration, the Reconstruction Finance Corporation, and the Department of Agriculture. The House rejected the plan, but the Senate approved it, thereby automatically putting it into effect. The House in general was anxious to cut appropriations for various phases of housing. Its Appropriations Committee criticized severely the work of the Public

Housing Authority. Subcommittees of the Joint Economic Committee investigated housing in several areas between the regular and special sessions.

An increase of $400,000,000 of the total of mortgage insurance under the National Housing Act was passed. The same bill permitted the insurance of mortgages on surplus permanent housing sold by the government.

INFLATION

In his message to Congress Nov. 17, President Truman suggested three curbs to inflation: the reduction of monetary pressure by control of credit and prevention of excessive speculation, the allocation of scarce goods to essential uses, and the establishment of price ceilings and controls in essential fields. The last included extension of rent control and authorization of consumer rationing on basic products in short supply. The following week, the Chairman of the Federal Reserve Board asked for authority to require all commercial banks to maintain a "special reserve" to reduce the "swollen money supply" and suggested the application of various other curbs. On Dec. 9, the Administration submitted the draft of a bill to give the President broad allocation and rationing powers until March 31, 1950. This would have included government purchase of the wheat crop, consumer rationing of fuel and many foods, an extension of wartime allocation powers over iron and steel, the extension of export controls and of authority to allocate transportation facilities and equipment.

Three days later, another bill was submitted by the Administration providing for establishment of price controls on basic commodities in short supply which had risen unreasonably in price since June 1947. The following day, the Congressional leaders presented a joint resolution which provided a one-year extension of export controls and authority to allocate transportation facilities. It authorized voluntary agreements between the Administration and representatives of business, industry, and agriculture with immunity from anti-trust laws. These agreements might cover allocation and inventory control of basic commodities in short supply, regulation of speculative trading on commodity exchanges, and marketing of livestock and poultry in the way that represented the most efficient utilization of grain. Additional gold reserves were also required of Federal Reserve Banks. The provision for increasing the reserves was later struck out. A voluntary food conservation program in the United States and one for promotion of food and livestock production in non-European countries was authorized. The President was requested to submit to Congress a detailed program to parcel out cost-of living items when they reached the "critical shortage" stage. It was suggested that Congress act on such programs within 15 days. The Presiden was given power to halt use of grain by distilleries until Feb. 1, 1948. Thi passed the Senate on Dec. 18 by vote of 77 to 10 and the House of Dec. 19.

GRAIN SPECULATION INVESTIGATION

While the anti-inflation measure were before Congress the Senate Appropriations Committee undertook a investigation of Federal governmen employees who might be speculatin in grain or commodity exchange The Secretary of the Army was aske to check persons in his departmen with access to Army recommendation on purchasing. Similar requests wer made of the State, Defense, Agricu ture, and Commerce department The Army Food Administrator wa questioned about the price paid fo Cuban sugar purchased through th Commodity Credit Corporation. O Dec. 11, Secretary Royall reporte that he had questioned 300 officia with access to information on pr jected Army purchases and none them had reported any speculativ transactions. He said that he had no asked that direct question of Edw W. Pauley, Special Assistant to th

Secretary of the Army, because Pauley had not had access to any information which could have been beneficial in commodity trading. He stated that he had reminded Pauley of a promise made when he took the post in September to liquidate his grain holdings as rapidly as possible under the capitol gains statute. Pauley replied that he was doing so. The Senate Committee summoned him to appear. On questioning he stated that he had owned about 500,000 bushels of grain when he accepted the post and had liquidated 90 per cent of it at a considerable loss to himself. He also said that he had not taken part in any transactions relating to purchases while in the department. He was questioned somewhat more about his transactions, and there was some discussion as to the propriety of gambling in food.

The Committee then moved to investigate other departments. Secretary of Agriculture Anderson was asked to produce a list of large scale speculators in commodity markets. Secretary Anderson appeared before the committee but expressed doubt as to his legal right under the Commodity Credit Act to make the information public and suggested that Congress adopt a resolution directing him to turn over the desired names. Such a resolution passed both houses and was signed by the President as Congress adjourned. The House of Representatives had voted to establish a committee to study commodity gambling. The list of names was expected to be supplied to both committees shortly. The House also voted to investigate the "steel gray" market.

SENATE WAR INVESTIGATION

It was decided early in the session to continue the Senate War Investigating Committee. The new chairman was Senator Owen Brewster of Maine. In March the Committee questioned James A. Moffet, formerly an international oil operator and later Housing Administrator, who reported that the Navy had lost heavily on oil deals in the Middle East. He testified that Arabian oil had been offered the Navy at 40 cents a barrel in 1941, that the offer had been rejected, and that the Navy had later to pay $1.05 a barrel for it. The whole case was quite complex and involved Saudi Arabian politics and concessions made to several American oil companies in that area. The Committee asked the President to ask the executors of President Roosevelt's estate to turn over certain papers relating to the case. For a time a stalemate developed on this, but later President Truman made available photostatic copies of some of the documents. The Committee appointed former Senator Burton K. Wheeler, who had investigated the Teapot Dome Scandals in the 1920's, as special investigator. Wheeler was in private law practice which he did not wish to give up. Therefore Congress passed a measure which exempted him from this requirement. President Truman vetoed this bill in his first veto of the session on the ground that the measure as drawn might be understood as giving the Committee counsel power to initiate civil or criminal proceedings on behalf of the United States. A redrafted version of the bill was signed by the President but by that time Wheeler had resigned the post and the Committee announced that it did not contemplate hiring any other counsel. No final report was made on the oil question.

In July the Committee reported that the work of the War Department on the Inter-American Highway had added $36,000,000 to the cost of the war without contributing to the defense of the United States. Both the planning of the project and the efficiency with which it was carried out were called into question.

THE HUGHES AIRPLANE HEARING

In February 1947, the Committee heard Howard Hughes, airplane manufacturer, report in closed session on his contract for a 200-ton seaplane, a project in which the Government had invested $18,000,000. The work was begun in 1942 without the approval of the War or Navy departments. The order for the planes came from the War Production Board and was financed by the Defense Plant Corporation. After questioning Hughes, the Committee decided to continue the investigation. Later Senator Brewster reported that Hughes asked for an inquiry into his affairs. A subcommittee sent to Hollywood to do this reported its testimony to the full Committee in July. At that time Senator Brewster announced that there had been "political pressure" to stop the inquiry. Public hearings were begun immediately after Congress adjourned and were followed with much interest. It appeared that in 1944 the War Production Board ordered cancellation of the contract but Jesse H. Jones, former Secretary of Commerce, testified that President Roosevelt had ordered its continuance on the ground that the experience gained from completion of one plane would be of too great value to throw away the money already expended. Then a new contract for only one plane was given with the arrangement that Hughes, who was making no profit, was to bear all losses beyond the $18,000,000 which the Government had given. Henry J. Kaiser, who had been a member of the original corporation, and Hughes were both questioned as was John W. Meyer, public relations man for Hughes. All sorts of charges were made, including one that the committee chairman had offered to quash the investigation if Hughes would withdraw his objection as controlling owner of one company to the merger of two major overseas air lines. This was promptly denied under oath. Another charge was that the Committee was especially interested in linking the investigation to a member of the family of the late President Roosevelt. This was denied by the assistant counsel to the committee under oath. Many personalities were exchanged. This aspect of the inquiry ended in mid-August when Hughes declared that he would exile himself from the country if the flying-boat turned out to be a total failure.

THE GEN. MEYERS INQUIRY

Later the subcommittee began t check steps taken to safeguard the government against improper actions of high ranking procurement officers The inquiry soon centered on Majo Gen. Bennett E. Meyers, retired, wh had been a procurement officer fo the Army Air Forces. It appeare that in 1943 he had held $35,074 i aviation stock but had failed to disclose this to his superiors in respons to a questionnaire. Later, the holdings were transferred to his wife wh held them under her maiden name The date of transfer, according t brokers' record, was actually mor than a year after the date of the questionnaire. An extensive series of hearings followed this disclosure. Fro these it appeared that General Meyer was perhaps secretly in control of war-contracting corporation while h was engaged in air force procurement He also acknowledged marginal dealings in government war bonds. I some of his testimony he was though to have laid himself open to charge of perjury. The evidence gathered b the subcommittee was transferred t the Department of Justice, the Burea of Internal Revenue, and the Arm Air Forces, all of which took appropriate steps to meet the situation.

The Committee also heard testimony on alleged excessive profit made by large oil companies on wartime contracts. Recommendations fo future renegotiations of similar contracts were made. Inquiry was mad into delays in bringing the 1939 industrial mobilization program int effect.

HOUSE COMMITTEE ON UN-AMERICAN ACTIVITIES

Another committee which attracte much public attention during the yea was the House Committee on Un-American Activities. The chairma of the committee after the Januar organization was Representative J Parnell Thomas of New Jersey. A the beginning of the year the outgoing committee recommended legislation to combat subversive elements. This included, first, a requirement that only American citizens be allowed to hold office in labor unions subject to Federal laws; second, denial of second class mailing privileges to foreign language newspapers not carrying a translation in adjacent columns; third, the creation of an independent commission to investigate and order the discharge of any government employee whose loyalty was doubtful and several other measures of a similar nature.

The Committee summoned Gerhart Eisler, alleged head of Communist activities in the United States, to appear before it. Eisler appeared but refused to testify and was cited by the House for contempt by a vote of 370 to 1. The House continued its investigation of Communism and held extensive hearings on a bill to outlaw the Communist Party. One of the witnesses was William C. Bullitt, former ambassador to Russia, who described the party as an agent of the Soviet Government but opposed the law because it might make "martyrs" of party members. J. Edgar Hoover of the Federal Bureau of Investigation testified that the party was a "fifth column." Eugene Dennis, general secretary of the American Communist Party, appeared as voluntary witness but refused to answer the question as to his "real name." He was then given a subpoena and required to appear before the Committee two weeks later. He did not appear but sent a statement defying the Committee and was at once cited for contempt. This was upheld later by the House. Similar proceedings were taken against Leon Josephson, alleged Communist passport ring leader who refused to testify before a subcommittee and refused to be sworn at a committee hearing. The cases were turned over to the Department of Justice. Eisler was convicted on June 10.

In September, the Committee held a three-day hearing on the case of Johannes Eisler, a brother of Gerhart, and an admitted former German Communist. Eisler was a musician whose entry into the country had apparently been championed by several prominent Americans who considered him a refugee from Naziism. The Committee recommended that he be prosecuted for perjury and for illegal contriving of entry into the United States and accused immigration officials of laxity in permitting him to take permanent residence here.

In the spring, Eric Johnston, president of the Motion Picture Association of America, appeared before the Committee. He denounced Communism but indicated opposition to the outlawing of the Communist Party, suggesting instead that Communist activities be prosecuted under sedition and treason laws. He stated that Communists the world over hated American films, and that though there were no doubt Communists in Hollywood their influence had not reached the screen. Members of the Committee suggested the presence of Communist forces in the industry. In October the Committee began an inquiry into Communist propaganda in the films. First various witnesses from Hollywood accused some screen writers and directors of Communism. Later these individuals were questioned. Ten of them refused to tell the House whether they were Communist party members and challenged the Committee's right to ask the question. They were cited for contempt, a measure later overwhelmingly approved by the House. Demonstrations and a spotlight of publicity accompanied all the investigation of the film industry. The Committee also described the organization American Youth for Democracy as communistic and urged state governors and college and university officials to bar it from American campuses. A subcommittee was named in March to investigate Fascist organizations in the United States.

OTHER INVESTIGATIONS

In July the Senate authorized major inquiries as a basis for future legislation into the operations of the Reconstruction Finance Corporation and the Social Security program. During the summer a special investigation into food costs was made for the use of several subcommittees of Congress. The House gave special powers of investigation including full authority to conduct hearings with the power to issue subpoenas to the Committee on Expenditures in the Executive Department. Special committees on small business and on the supply of newsprint were also created by the House. Final reports had not been made by most of these groups at the end of the year.

PORTAL-TO-PORTAL PAY

Portal-to-portal pay was a problem at the opening of the session as the result of a Supreme Court decision in June 1946 which had brought about a large number of back pay suits. Several bills on this subject were introduced early in January. A fairly stringent measure passed the House by a vote of 345 to 56 on Feb. 28, 1947, and a slightly different one was voted by the Senate 64 to 24 on March 21. On May 1, the measure as adjusted by conference went to the White House. This barred existing and future claims for portal-to-portal back pay unless such suits were based on bona fide employer-employee contracts or were recognized as being in accord with custom in the area concerned. Compromises would be permitted only within the framework of hourly wage standards of 40 cents with 60 cents for over time. There was a two-year limit on filing claims under the existing Wages and Hours law. Group claims required a written order from each employee covered. Employers would be exempt from liability on past claims if any government agency had approved the wage already paid. President Truman signed the bill, stating that he did so because in the interest of economic stability it was essential to clarify the issue. In the message accompanying his signature he urged increase of the minimum wage from 40 cents to 65 cents an hour and extension of the law to many persons not presently covered.

ANTI-STRIKE MEASURES

Even greater interest was shown in anti-strike measures. Many hoped for a stronger version of the Case bill vetoed in 1946, and several bills were presented at the opening of the session. The House Labor Committee held extensive hearings and drafted a sweeping labor control bill reported to the House on April 12. Five days later this was passed 308 to 107 by a vote which to some extent crossed party lines. Ninety-three Democrats supported the measure and 22 Republicans opposed it. A much milder bill passed the Senate May 13 after three weeks of debate. Conference negotiations lasted also for three weeks. The measure finally producd was substantially the Senate version. This continued the National Labor Relations Board but increased the membership to five and made future appointees subject to Senate confirmation. A general counsel at a salary of $12,000 was added also, subject to confirmation. Federal injunctions were permitted against strikes menacing public health or safety. The National Labor Relations Board was permitted to obtain injunctions against jurisdictional strikes, secondary boycotts, or strikes to force an employer to hire unneeded men. Unions were made liable for employer damage suits for jurisdictional strikes, secondary boycotts, or violation of contracts. Bargaining rights were denied to supervisory workers. Officials of all unions seeking certification as bargaining agents were required to swear that they were not Communists and might be prosecuted for false swearing. Employer contributions to welfare funds were permitted if union and management administered the funds jointly. Employers were permitted to address workers on labor matters if this was done without threats or promise of benefits. This Labor-Management Relations Act of 1946 was considered one of the most difficult legislative achievements of the session. It was approved by the House by 320 to 79 and by the Senate with a 54 to 17 vote.

On June 20, President Truman vetoed the bill, charging that it would reverse the basic direction of our national labor policy, inject the Government into private economic affairs on an unprecedented scale, and conflict with important principles of our democratic society. He thought the measure unworkable and likely to increase strikes, unfair to workers and annoying to employers. The emergency procedure for major strikes was too complex. The House promptly overrode the veto 331 to 83. In the Senate, delaying action prevented an immediate vote. Senator Morse talked for 10 hours. The Senate remained in session for 28 hours and 32 minutes before a proposal for an agreed time of voting was accepted. The total continuous session was nearly 31 hours, the longest Senate session since 1927. The purpose of the delay was a hope that lapse of time and outside pressure would effect a change of sentiment. On June 23, however, the Senate overrode the veto by 68 to 25. Twenty Democrats voted with the majority, 22 to sustain the veto.

The Senate later named seven members of a joint committee on Labor Management to watch the operation and administration of this act and to study labor relations in many aspects. The committee was given initial funds of $150,000.

OTHER LABOR MATTERS

Lesser labor activities included a report in January of the 1946 special House campaign investigating committee that it had turned over to the Department of Justice information indicating that 60 CIO unions and locals and 11 corporations had violated the Corrupt Practices Act in the 1946 Congressional election. The House Labor Committee of the Eightieth Congress also conducted several investigations, one into the relations of the American Newspaper Guild and the striking employees of certain Philadelphia and New Jersey papers. A subcommittee made a long study of the 1941 strike at the Allis-Chalmers plant in Milwaukee and reported that it was apparently called by direction of the Communist Party. The Labor Committee adopted the conclusions of the subcommittee but withheld the full report from publication at the request of the Department of Justice. The report was then given to that Department to be used as evidence of false testimony given by Harold Christoffel and Robert Buse, union leaders at the plant.

PRESIDENTIAL TENURE AND SUCCESSION

A constitutional amendment to limit presidential tenure to two terms passed the House by a vote of 285 to 121. The Senate adopted the amendment 59 to 23; it then went before the states for ratification. The proposal prohibited any person from being elected more than twice but permitted a vice-president who had succeeded to the presidency to serve two additional full terms if he had not served for more than two years of his predecessor's unexpired term. The States were given seven years in which to ratify the proposal. This does not apply to the incumbent president or to anyone who is president when the measure becomes operative.

The law governing the presidential succession was changed. For many years, succession following the vice-president had been vested in the Cabinet beginning with the Secretary of State and continuing with all Cabinet posts created before 1886. President Truman requested a change soon after he took office in 1945. pointing out that it was undesirable to have a situation in which a President might be naming his own successor. The new law placed the Speaker of the House first in the event of the death, removal, resignation or inability of both President and Vice-President to serve. He was to be followed by the President Pro Tempore of the

Senate and then by the Cabinet in order, beginning with the Secretary of State and including the Secretaries of Agriculture, Commerce, and Labor.

SCIENCE RESEARCH

A measure to establish a national science foundation passed both houses and was sent to the President July 22. He pocket-vetoed it Aug. 6 with a strong note of disapproval. The agency which would have succeeded the wartime Office of Scientific Research and Development would have had 24 members appointed by the President with Senate confirmation. These men, eminent in fields of fundamental sciences, medical science, education, engineering, or public affairs, would have been required to promote basic research by grants, scholarships and other forms of assistance to individuals, institutions and organizations and to coordinate their programs with those undertaken by individuals and other research groups. The foundation would have appointed special commissions to survey research in particular fields. President Truman had long favored a national science foundation but objected to the administrative system provided in this bill. He felt that it vested full authority in 24 part-time officers whom the President could not hold responsible for proper administration. Moreover, the director of the Foundation, appointed by the Foundation, would not be directly responsible to the President. President Truman expressed the hope that the measure would be passed in an acceptable form at the next session.

TERRITORIES

A bill to admit Hawaii as the 49th state passed the House of Representatives in June. Action was not taken by the Senate. A measure was passed giving miners in Alaska permission to mine for gold and other precious metals in navigable streams there. Miners had feared effects of a recent court ruling. A measure passed at the close of the session gave the people of Puerto Rico the right to elect their governor. President Truman, in signing the bill, expressed regret that it had been passed too late in the session to permit amendment to allow the governor to appoint members of the Supreme Court of Puerto Rico.

VETERANS

On July 7, the House voted 386 to 0 to permit approximately $1,792,000,000 to $2,000,000,000 in terminal leave bonds to be cashed, beginning Sept. 1 1947, by former members of the armed forces. The bonds distributed in 1946 were designed originally to mature in five years. The Treasury protested that the measure would prove inflationary. The measure also extended until Sept. 1, 1948 the time in which former service men might apply for benefits. On July 19, the measure was unanimously adopted by the Senate. President Truman signed the bill a week later but advised veterans not to cash the bonds which carry 2½ per cent interest if held.

The War Veterans Act of 1924 was amended to permit for an additional five-year period the renewal of five-year level-premium government life insurance policies.

The sum of $35,500,000 was authorized for veterans' temporary housing The money was to be used by the National Housing Administrator to complete work on over 8,000 housing units begun by state or local units, educational institutions, or non-profit organizations.

WAR POWERS

The President asked early in the session that some parts of the Second War Powers Act be extended for another year, especially those which permitted allocation of powers by executive action if the President declared a state of emergency. Seven of the 14 titles of the original act had already been permitted to lapse. President Truman asked extension of three of those remaining. Shortly thereafter he asked repeal of a number of wartime laws. The First Decontrol Act of 1947, passed in March 1947, removed many wartime controls but gave a three-months extension for allocations of cinchona bark, fiber, tin, and certain other materials and facilities certified by the Secretaries of State and Commerce as necessary to meet international commitments. In the Second Decontrol Act most of these controls were continued until March 1, 1948. The second act also extended the wartime export-import controls and the controls over rail facilities exercised by the Office of Defense Transportation. The bulk of the war powers were ended by a measure signed by the President July 25. Controls over exports and over transportation facilities were extended to Feb. 28, 1949 by the act passed in December to combat inflation.

WARTIME CONTROLS

Federal controls over consumer installment credit were ended as of Nov. 1. As the measure passed the House, it provided for immediate lifting of the restrictions but the provisions were modified in conference. President Truman stated in signing the measure that he did so with reluctance but that three additional months of control were better than none.

Rent control was much discussed. On April 1, President Truman sent a plea for its continuance through June 30, 1948. Bills which passed the House on May 1 and the Senate on June 2 differed on a number of details. Conferees agreed on a measure which extended controls to March 1, 1948 but permitted an increase of 15 per cent over existing ceilings if the tenant agreed and a lease running through 1948 were signed. Signing of such a lease rendered the housing unit no longer subject to Federal rent control.

Transient accommodations of various sorts were decontrolled as were housing units completed after Feb. 1, 1947 and residential structures converted to rental use after that date. Control over evictions was largely returned to the states. Local rent boards were established to recommend area-wide ceiling increases or decontrol. A number of building control regulations were lifted. The modified measure passed the House 163 to 73 and the Senate by a voice vote. It was signed by the President on June 30, the date when controls would otherwise have expired, accompanied by a message explaining that the measure was the lesser of two evils and asking for legislative action to promote construction of various types of housing.

In a deficiency appropriation measure completed March 12, it was provided that the Office of Price Administration be terminated by June 30. Sufficient new funds were granted the agency to supply terminal leave pay of O.P.A. employees as required by law.

Legislation extending rationing and price control of sugar until Oct. 31, 1947 was signed on March 31 just before the time at which rationing would have expired. The measure contained a proviso that individuals receive at least 20 pounds each during the seven months extension period.

WOOL TARIFF

On June 19, Congressional action was completed on a measure which continued domestic wool-price subsidies and authorized the President to restrict to half the normal volume the amount of wool which could be brought in from abroad or to impose additional tariff on wools if importations interfered with the domestic price program. This was vetoed on the ground that it would have an adverse effect on our international relations and was not necessary for the support of domestic wool growers. The President expressed willingness to sign a measure continuing price support to domestic producers at not less than 1946 price levels. This was to be done through the agency of the Commodity Credit Corporation. A measure without the objectionable provisions was passed promptly.

MISCELLANEOUS LEGISLATION

An act was passed changing the name of Boulder Dam to Hoover Dam. A measure was approved authorizing the Government to continue to operate a tin smelter at Texas City until June 30, 1949. This was to be done by the Reconstruction Finance Corporation. Annuities were provided for Federal Bureau of Investigation agents who had served 20 years or more and were 50 years of age or older. A bill was approved providing for re-establishment of sugar quotas which had been suspended during the war. President Truman pocket-vetoed a measure which would have provided subsidies for non-ferrous metals. Legislation was passed making Federal surplus property available to state and local agencies for flood relief. An anti-poll tax bill was passed in the House by a vote of 290 to 112 but no action was taken by the Senate.

The presidential Reorganization Plan No. 2 which would have given the Labor Department permanent control over the United States Employment Service and transferred the functions of the Wages and Hours Administrator to the Secretary of Labor was rejected by both House and Senate. No objection was made to Plan No. 1 which concerned chiefly the internal organization of the War and Navy Departments. Plan No. 3 dealing with Housing, was rejected by the House but approved in the Senate The President had requested a Federal health program. Hearings on measures dealing with this were held in both houses but no action was completed.

The Reconstruction Finance Corporation was extended to June 30, 1948 with a limitation of $2,000,000,000 on its lending authority for new business. The life of the Commodity Credit Corporation was extended to the same date. The Farm Labor Supply program was continued to Dec. 31, 1947 with provision for liquidation of the program.

A temporary Congressional Aviation Policy Board of 10 members was established. Five were to be appointed by the President pro tempore of the Senate and five by the Speaker of the House. The board was to study national defense, commerce, postal and other aviation problems and report to Congress by March 1, 1948

The three-cent rate on first class letters was made permanent. All other postal rates which would have expired on June 30, 1947 were retained

THE SUPREME COURT AND CONSTITUTIONAL LAW

By Robert K. Carr
Professor, Dartmouth College

GENERAL

During the year 1947 there were no changes in the personnel of the Supreme Court. The Court decided 136 cases with opinion, well over half of which were marked by dissents. In 23 cases, four justices dissented, and in 21 cases three dissented. The recent tendency of the justices to write separate concurring and dissenting opinions remained strong. In the cases which raised major constitutional issues it was not uncommon to find three, and even four opinions being filed. In the John L. Lewis contempt case five opinions were written. Justice Frankfurter persisted in his practice of writing separate concurring (or dissenting) opinions in cases with constitutional issues.

As has been true of the present Court in earlier years, it is difficult to classify the nine justices according to their differing views. The concurring and dissenting groups are constantly shifting. On the other hand, where the Court is divided, five to four, Justices Black, Douglas, Murphy, and Rutledge often stand together in the minority, and Chief Justice Vinson and Justices Reed, Frankfurter, Jackson, and Burton make up the majority.

Certain general tendencies can be

noted briefly. Judicial review of legislation, Federal and state, was a very minor aspect of the Court's work in 1947. The constitutionality of Federal statutes was an issue in not more than half a dozen cases, and no Federal law was held invalid. Cases involving state laws were somewhat more numerous but in almost all of these the challenged legislation met the test of constitutionality.

As the exercise of the Court's power of judicial review has declined, the very great power which the justices wield in interpreting statutes is seen in a stronger light. In more than one third of the cases heard by the Court in 1947, it was called upon to interpret Federal laws. The Fair Labor Standards Act was involved in nine cases and the National Labor Relations Act in five. The following Federal statutes figured prominently in Supreme Court decisions: the Sherman Act and other anti-monopoly laws, Interstate Commerce Acts, Social Security Act, OPA legislation, Federal Employers' Liability Acts, Bankruptcy Act, Transportation Acts. Norris-LaGuardia Act, Selective Service and Training Act, patent laws and tax laws.

The increasing reluctance of the Court to reach the merits in cases raising constitutional issues was apparent during the year. The Court continues to adhere to its policy of "strict necessity" in disposing of constitutional issues. This policy can be seen, for example, in the *Petrillo* case in which the Court subjected the Act of April 16, 1946, curbing labor practices in radio broadcasting, to a very limited test of constitutionality.

CLASSIFICATION OF CASES

The most important decisions of general public interest made by the Supreme Court in 1947 do not range widely through the traditional areas of constitutional law. About half of the cases described in this article are concerned with crimes and criminal procedure, Federal and state. In perhaps no previous year in the Court's history have there been so many cases dealing with such issues as the nature of the crime of treason, the right to habeas corpus, the right to assistance of counsel, the right to trial by jury, and the rights to be free from self-incrimination, unreasonable search and seizure, and cruel and unusual punishment. The tendency of the present Court to review a relatively large number of Federal and state criminal proceedings in which charges of miscarriage of justice have been made has led many people to view this Court as the most civil liberty-minded one in our history. However, in many of the 1947 cases in this category, a majority of the justices failed in the end to provide the accused person with relief. This result has raised fears that the Court is growing more conservative in its disposition of civil rights cases.

Freedom of religion was an issue in one of the most important cases of the year, the New Jersey bus case. Freedom of the press figured in the Texas newspaper contempt case. There were two major labor cases, those involving the well-known labor leaders, John L. Lewis and James Caesar Petrillo. The constitutionality of the Hatch Act, which limits the political activity of government employees, was tested in two cases. Federal-state relations, an issue that has loomed large in other years, figured in few important cases. It was present, however, in *United States v. California,* in which title to the oil rights lying within the three-mile limit off our coastline was disputed by the Federal and state governments. It was also present in several cases, which are part of a never-ending series, involving conflict between the Federal commerce power and the state taxing power. One such case resulted in the invalidation of a New York tax falling upon the stevedore business—one of the very few instances in 1947 in which the Court held legislation unconstitutional.

STATE CRIMINAL PROCEDURE—BLUE RIBBON JURY CASE

New York State has a statute, dating back to 1901, by which special cases in counties with more than 1,000,000 people can be tried by so-called blue ribbon juries. A judge may at his discretion order the use of such a jury in civil or criminal cases at the request of either party. "The motion may be granted only on a showing that 'by reason of the importance or intricacy of the case, a special jury is required' or 'the issue to be tried has been so widely commented upon . . . that an ordinary jury can not without delay and difficulty be obtained' or that for any other reason 'the due, efficient and impartial administration of justice in the particular case would be advanced by the trial of such an issue by a special jury.'" More than 100 convictions for murder have taken place under this statute.

In New York County, the operation of the law shrinks the regular jury panel from about 60,000 names to about 3,000. Four additional tests of qualification and fitness beyond those used for regular jurymen are employed in selecting special juries. For example, the fourth of these tests eliminates from the blue ribbon jury panel, "all who doubt their ability to lay aside an opinion or impression formed from newspaper reading or otherwise, or to render an impartial verdict upon the evidence uninfluenced by any such opinion or impression, or whose opinion of circumstantial evidence is such as would prevent their finding a verdict of guilty upon such evidence, or who avow such a prejudice against any law of the state as would preclude finding a defendant guilty of a violation of such law, or who avow such a prejudice against any particular defense to a criminal charge as would prevent giving a fair and impartial trial upon the merits of such a defense, or who avow that they can not in all cases give to a defendant who fails to testify as a witness in his own behalf the full benefit of the statutory provision that such defendant's neglect or refusal to testify as a witness in his own behalf shall not create any presumption against him."

This statute was held constitutional by a five-to-four vote in *Fay v. New York* and *Bove v. New York* (June 23). Fay and Bove, labor union officers, were found guilty of extortion in a New York court. There was evidence that they had accepted $300,000 from private contractors doing business with New York City. Their trial was by a special blue ribbon jury. The convictions were affirmed by the New York appellate courts, and the Supreme Court granted certiorari.

In the majority opinion by Justice Jackson, joined by Vinson, Reed Frankfurter, and Burton, it is stated that "the question is whether a warranted conviction by a jury individually accepted as fair and unbiased should be set aside on the ground that the make-up of the panel from which they were drawn unfairly narrows the choice of jurors and denies defendants due process of law or equal protection of the laws in violation of the Fourteenth Amendment to the Federa Constitution." On its face, the act i held to meet the test of constitutionality because it does not exclude any person from a jury because of race color, creed, or occupation. It is hel that such a law can relieve a congested court situation by bringin about the early rejection of person as jurors, many of whom would late have to be excused by the court o challenge for cause. Justice Jackso argues that the Supreme Court mus be careful "not to hamstring loca authority by artificial or doctrinair requirements" with respect to "practical matters in administering justice. The majority also rejects a contentio that the act, if valid on its face, ha been administered unconstitutionall in Fay and Bove's case. It is held tha there is insufficient evidence to support the charge that laborers an women have been systematically excluded from juries under the act. Fa and Bove also argued that blue ribbo juries are more prone than ordinar juries to convict. A 1938 report of th New York State Judicial Council i cited to this effect. Its studies sho that, in 1933, special juries convicted in 83 per cent of the cases, while ordinary juries convicted in only 43 per cent of the cases. Moreover, in 1945 the Council proposed that the special jury "be abolished as unnecessary and undesirable." The Supreme Court holds that the 1933 figures are too old to carry weight. Justice Jackson does suggest that, if a similar discrepancy could be proved for 1945, "some foundation would be laid for a claim of unequal treatment." But he intimates that such a wide discrepancy no longer existed in 1945.

The dissenting opinion is by Justice Murphy, joined by Black, Douglas, and Rutledge. Statistical evidence showing the systematic exclusion of certain occupational groups from blue ribbon juries is accepted as valid by the dissenters, who then observe that "the equal protection clause of the Fourteenth Amendment prohibits a state from convicting any person by use of a jury which is not impartially drawn from a cross-section of the community. And a cross-section of the community includes persons with varying degrees of training and intelligence and with varying economic and social positions."

THE RIGHT TO ASSISTANCE OF COUNSEL

In 1932 in *Powell v. Alabama* (287 U. S. 45), the Supreme Court for the first time ruled that the right to the assistance of counsel, which is guaranteed to all accused persons in the Federal courts by the Sixth Amendment, is carried over into the area of state criminal procedure by the due process clause of the Fourteenth Amendment. Thereafter, in a series of conflicting rulings the Court has sometimes ruled that the right is available in the state courts, sometimes unavailable. Three cases raised the issue again during 1947, and the decisions in these cases have not dispelled the confusion created by the earlier rulings. In *De Meerleer v. Michigan* (Feb. 3), a unanimous Court in a per curiam opinion holds that the right has been improperly denied to a 17-year-old youth who in 1932 was convicted in a Michigan court of first degree murder and sentenced to life imprisonment. The trial judge failed to explain to him the consequences of his plea of guilty, and at no time during the proceedings did he enjoy the benefit of counsel, nor was he ever advised of his right to it. "Here a seventeen year old defendant confronted by a serious and complicated criminal charge was hurried through unfamiliar legal proceedings without a word being said in his defense."

A contrary result prevailed by five-to-four votes in *Foster v. Illinois* and *Gayes v. New York* (both June 23). In the *Foster* case, the Court reviews the conviction of two defendants in 1935 in an Illinois court on a charge of burglary and larceny. Both men pleaded guilty after the judge had advised them of the consequences of such a plea. However, he had not offered them the assistance of counsel, and Illinois law did not require that he do so. Ultimately, an original proceeding was had in the Illinois Supreme Court by way of writ of error to test the validity of the sentences of imprisonment. When the writ was denied, the United States Supreme Court granted certiorari.

In the majority opinion, Justice Frankfurter, joined by Vinson, Reed, Jackson, and Burton, holds that there has been no miscarriage of justice. It is stated that the due process clause of the Fourteenth Amendment does not subject the states to the fixed requirement of the Sixth Amendment as to assistance of counsel. However, the majority holds that "process of law in order to be 'due' does require that a state give a defendant ample opportunity to meet an accusation. And so, in the circumstances of a 'particular situation,' assignment of counsel may be 'essential to the substance of a hearing' as part of the due process which the Fourteenth Amendment exacts from a state which imposes sentence." But there must be a showing that, for want of benefit of counsel, "an ingredient of unfairness" has "actively operated in the process" that results in a man's confinement. In the opinion of the majority no such "ingredients" were present in this case. Justices Black and Rutledge filed separate dissenting opinions, all four dissenting justices (Black, Douglas, Murphy, and Rutledge) concurring in both opinions. Justice Black charges "in this case the Court . . . waters down the Bill of Rights guarantee of counsel in criminal cases." And further, "this decision is another example of the consequences which can be produced by substitution of this Court's day-to-day opinion of what kind of trial is fair and decent for the kind of trial which the Bill of Rights guarantees." In the Rutledge opinion, the dissenters take the position that, even if the Sixth Amendment's guarantee is not to be held automatically applicable in state criminal cases, the record in the case discloses a lack of due process of law.

In the *Gayes* case a lad of 16 pleaded guilty in 1938 to a charge of burglary and larceny. He was offered counsel, but he refused the offer and was committed to a state vocational school. In 1941, following his release, he again pleaded guilty to a similar charge and was sentenced. To avoid serving a sentence as a second offender he endeavored to have the judgment in the first case vacated because of his lack of counsel. The same majority as in the *Foster* case fails to reach the merits, holding that Gayes should have contested the validity of the first sentence when he was about to be sentenced a second time. The four dissenting justices are of the opinion that Gayes' procedure was proper under New York law, that the Supreme Court should consider the case on its merits, and that the record discloses Gayes had improperly been denied assistance of counsel contrary to the Fourteenth Amendment.

THE RIGHT TO BE FREE FROM SELF-INCRIMINATION

The conflict between the two points of view which are now held by members of the Supreme Court concerning the extent to which the Bill of Rights is reenacted for the states by the Fourteenth Amendment is nowhere better illustrated than in the opinions in *Adamson v. California* (June 23). In this case, the Court was invited to reverse the 40-year-old holding of *Twining v. New Jersey* (211 U. S. 78 1908) that the Fourteenth Amendment does not compel the states to grant persons accused of crime freedom from self-incrimination. This freedom is recognized in Federal criminal procedure as the result of the specific language of the Fifth Amendment. Adamson was convicted of murder in the first degree in a California court and was sentenced to death. He did not take the witness stand. A California statute, unlike the law of most states, permits the failure of an accused person to testify in his defense to be commented upon by court and counsel and to be considered by a jury. Adamson's conviction was affirmed by the California Supreme Court, and he appealed to the United States Supreme Court, challenging the constitutionality of the California statute.

In the majority opinion by Justice Reed, joined by Vinson, Jackson, and Burton, the Court holds that the self-incrimination clause of the Fifth Amendment is not made effective as a protection against state action by the Fourteenth Amendment, and also that this freedom is not inevitably associated with the concept of due process of law. "For a state to require testimony from an accused is not necessarily a breach of a state's obligation to give a fair trial." In a separate concurring opinion, Justice Frankfurter asserts that the decision in *Twining v. New Jersey* was one of the greatest in the Court's history and should certainly not now be reversed. Moreover, he specifically and vigorously rejects the notion that the due process clause of the Fourteenth Amendment applies all of the Bill of Rights to the states. "The notion that the Fourteenth Amendment was a covert way of imposing upon the states all the rules which it seemed important to Eighteenth Century statesmen to write into the Federal Amendments was rejected by judges who were themselves witnesses of the process by which the Fourteenth Amendment became part of the Constitution." Instead, Frankfurter holds the Supreme Court must use its discretion in reading into the due process clause of the Fourteenth Amendment only those rights which are basic and fundamental to justice.

Justices Black, Douglas, Murphy, and Rutledge dissent from the Court's ruling. Justice Black, joined by Douglas, makes a specific attack upon Justice Frankfurter's position and argues that it is dangerous to let the Supreme Court define due process of law in changing fashion in the light of the sense of "civilized decency" and "fundamental liberty and justice" prevailing at any given moment. Instead, he would give to procedural due process a fixed meaning by holding that its limits are determined by the specific guarantees enumerated in the first eight amendments. ". . . I would follow what I believe was the original purpose of the Fourteenth Amendment—to extend to all the people of the nation the complete protection of the Bill of Rights. To hold that this Court can determine what, if any, provisions of the Bill of Rights will be enforced, and if so to what degree, is to frustrate the great design of a written Constitution." And he virtually accuses the majority of considering "the Bill of Rights to be an outworn 18th Century 'strait jacket' as the Twining opinion did."

In a separate dissenting opinion, Justice Murphy, joined by Rutledge, agrees with Justice Black that all of the guarantees of the Bill of Rights are carried over into the Fourteenth Amendment, but he asserts that there may well be other guarantees which are also included in the Fourteenth Amendment.

THE RIGHTS TO BE FREE FROM DOUBLE JEOPARDY AND FROM CRUEL AND UNUSUAL PUNISHMENTS

Louisiana ex rel. Francis v. Resweber (Jan. 13) presented such an unusual situation that Justice Reed, who writes the majority opinion, is led to comment that "this case is without precedent in any court." Willie Francis was duly convicted of murder in a Louisiana court in September 1945, and was sentenced to be electrocuted. On May 3, 1946, he was placed in the chair. The switch was thrown but "because of some mechanical difficulty, death did not result." No further attempt was made at that time to complete the electrocution, and before a new attempt could be made at a later date Francis was allowed to appeal to the courts on the ground that his execution under the circumstances would deny him his rights to be free from double jeopardy and cruel and unusual punishments. The Louisiana Supreme Court refused to help Francis on the ground of a lack of any basis for judicial relief. The United States Supreme Court then granted certiorari.

A Supreme Court majority (Reed, Vinson, Black, and Jackson) assumes, but does not decide, that the Fourteenth Amendment safeguards the two rights in question against state encroachment, but it holds that neither right has been denied to Francis. As to the double jeopardy issue, the Court holds that "when an accident with no suggestion of malevolence, prevents the consummation of a sentence, the state's subsequent course in the administration of its criminal law is not affected on that account by any requirement of due process under the Fourteenth Amendment. We find no double jeopardy here . . ." As to the second issue, the Reed opinion holds that, to compel Francis to undergo the psychological strain of preparation for electrocution a second time, will not amount to cruel and unusual punishment. Nor will the result be a more severe punishment than that ordinarily imposed on others for the same crime, amounting to a denial of equal protection of the laws.

In a separate concurring opinion, Justice Frankfurter once more seizes the opportunity to consider the rela-

U OF I

tionship between the Bill of Rights and the Fourteenth Amendment. "In an impressive body of decisions this Court has decided that the Due Process Clause of the Fourteenth Amendment expresses a demand for civilized standards which are not defined by the specifically enumerated guarantees of the Bill of Rights. They neither contain the particularities of the first eight amendments nor are they confined to them." Accordingly, "great tolerance toward a state's conduct is demanded of this Court." Since Justice Frankfurter can not say that what is happening to Willie Francis is "repugnant to the conscience of mankind" or "offends a principle of justice 'rooted in the traditions and conscience of our people,'" he does not think the Court should intervene under the Fourteenth Amendment.

Attention is called in the dissenting opinion by Justice Burton, joined by Douglas, Murphy, and Rutledge, to "the contrast . . . between instantaneous death and death by installments." It is pointed out that electrocution was originally upheld, against the argument that it is cruel and inhuman, on the ground that death takes place instantaneously (*Re Kemmler,* 136 U. S. 436, 1890).

It is suggested that repeated application of electricity to cause death is like burning at the stake, and is cruel and unusual. And "lack of intent that the first application be less than fatal is not material." The dissenters would send the case back to the Louisiana Supreme Court for a factual determination as to whether an electric current actually passed through Francis when he was placed in the chair the first time.

FEDERAL CRIMINAL PROCEDURE —RIGHT TO BE FREE FROM UNREASONABLE SEARCH AND SEIZURE

The troublesome issue of search and seizure returned to the Court in one of the most controversial cases of the year, *Harris v. United States* (May 5). Harris was convicted in a Federal court under the Selective Service and Training Act of 1940 for unlawful possession and alteration of Notice of Classification Cards and Registration Certificates. The Circuit Court of Appeals affirmed the conviction, and the Supreme Court took the case on certiorari. Two warrants of arrest (but not a search warrant) had been issued to FBI agents, charging violations of the Mail Fraud Act and the National Stolen Property Act. Five agents went to Harris' apartment and arrested him in the living room under these warrants. A search of the entire apartment was made to find evidence relating to the forging of a $25,000 check drawn on the Mudge Oil Company. The search lasted five hours and, in the words of a dissenting opinion by Justice Murphy, the agents "literally tore the place apart from top to bottom, going through all of petitioner's clothes and personal belongings, looking underneath the carpets, turning the bed upside down, searching through all the bed linen, opening all the chest and bureau drawers, and examining all personal papers and effects. Nothing was left untouched or unopened." No evidence pertaining to the forgery was discovered and Harris was never prosecuted for this offense, but in the course of the search the draft cards were found in a bureau drawer in a bedroom, and this evidence resulted in Harris' conviction for a totally different crime from the one for which he was arrested.

There are four opinions in the case. That for the majority is by Chief Justice Vinson, joined by Black, Reed, Douglas, and Burton. The Court holds that officers can properly search all of the rooms of an apartment at the time an arrest is made under a warrant of arrest. "The search was not a general exploration but was specifically directed to the means and instrumentalities by which the crimes charged had been committed. . . ." There is a review of Supreme Court rulings as to search and seizure which leads the Chief Justice to conclude that the objects which may properly be seized under a search warrant or during a search incident to arrest include "the instrumentalities and means by which a crime is committed, the fruits of crime such as stolen property, weapons by which the escape of the person arrested might be effected, and property the possession of which is a crime. . . . Here during the course of a valid search the agents came upon property of the United States in the illegal custody of the petitioner . . . A crime was . . . being committed in the very presence of the agents conducting the search. Nothing in the decisions of this Court gives support to the suggestion that under such circumstances the law-enforcement officials must impotently stand aside and refrain from seizing such contraband material."

The three dissenting opinions in the case are all strongly worded. Justice Frankfurter, joined by Murphy and Rutledge, states that "if one thing on this subject can be said with confidence it is that the protection afforded by the Fourth Amendment against search and seizure by the police, except under the closest judicial safeguards, is not an outworn bit of Eighteenth Century romantic rationalism but an indispensable need for a democratic society." In Frankfurter's opinion the search made at the time of an arrest, without a search warrant, must be limited to what is incidental to the arrest—it may not include an indiscriminate search of all a man's belongings. ". . . the warrant for the arrest of a person carries with it authority to seize all that is on the person, or in such open and immediate physical relation to him as to be, in a fair sense, a projection of his person." Finally he asserts that, even if the search in this case be held reasonable, the seizure was not. If the FBI agents had had a search warrant for the forged check they would not have been entitled to seize other items. Thus, "the Court's decision achieves the novel and startling result of making the scope of search without a warrant broader than an authorized search."

Justice Murphy, joined by Frankfurter and Rutledge, in a second dissenting opinion, asserts that "the Court today has resurrected and approved, in effect, the use of the odious general warrant or writ of assistance, presumably outlawed forever from our society by the Fourth Amendment."

Justice Jackson in a lone dissenting opinion disagrees with the other dissenters that the length or thoroughness of the search somehow made it improper. He believes that "the fair implication of the Constitution is that no search of premises, as such, is reasonable except the cause for it be approved and the limits of it fixed and the scope of it particularly defined by a disinterested magistrate."

THE RIGHT TO HABEAS CORPUS

The Supreme Court has in recent years had several occasions to examine the right of members of the Jehovah's Witnesses sect to secure judicial review of draft board rulings denying them exemption from military service on religious grounds. In *Falbo v. United States* (320 U. S. 549 1944), the Court held that under the draft legislation Falbo was not entitled to judicial review of a selective service order. In *Estep v. United States* (327 U. S. 114 1946), this ruling was modified somewhat, and the Court held that limited judicial review could be had by a registrant who has first exhausted his administrative remedies.

Two additional cases involving the draft troubles of Jehovah's Witnesses were decided by the Court in 1947. In *Sunal v. Large* (June 23), the Court passed upon the use of the writ of habeas corpus by a registrant as a means of securing judicial review of his draft classification. Sunal and Kulick registered under the draft legislation but claimed exemption as ministers. They were refused exemption by their draft boards and ordered to report for induction into the armed services. They reported but refused to submit to induction. Thereafter they were indicted, convicted, and sentenced to imprisonment for a term of years. Neither appealed since the state of the law at the time made appeal seem futile.

The following year, the Supreme Court handed down its ruling in the *Estep* case and in the light of this decision it was plain that the trial court had committed an error in excluding evidence in behalf of Sunal and Kulick that their draft boards had exceeded their jurisdiction in making the classifications which they did. Shortly after the *Estep* ruling, petitions for writs of habeas corpus were filed in behalf of both men. In each case, a Circuit Court of Appeals held that habeas corpus was an available remedy. The two cases ultimately reached the Supreme Court by the certiorari route, and a majority of six justices held that habeas corpus was not a proper or available remedy under the circumstances.

In the opinion by Justice Douglas, joined by Vinson, Black, Jackson, Reed, and Burton, it is stated that "the normal and customary method of correcting errors of the trial is by appeal. So far as convictions obtained in the federal courts are concerned, the general rule is that the writ of habeas corpus will not be allowed to do service for an appeal." It is admitted that there are exceptions to this rule. ". . . where the error was flagrant and there was no other remedy available for its correction, relief by habeas corpus has sometimes been granted." One exception recognized by the Court is where the state of the law governing a man's case has changed after the time for appeal has expired. But Sunal's case is held not to be of that type. Here, "the definitive ruling on the question of the law had not crystallized. If in such circumstances, habeas corpus could be used to correct the error, the writ would become a delayed motion for a new trial, renewed from time to time as the legal climate changed."

In the first of two dissenting opinions Justice Frankfurter argues that earlier Supreme Court rulings concerning the use of habeas corpus "give dubious and confused answers" to the question of its availability. Here "is an untidy area of our law that calls for more systematic consideration . . ." He reviews the different situations in which the use of the writ for appeal purposes has been allowed and concludes that its use here should be permitted "to prevent a complete miscarriage of justice." In the second dissenting opinion, Justice Rutledge, joined by Murphy, states that "the writ should be available whenever there clearly has been a fundamental miscarriage of justice for which no other adequate remedy is presently available."

Cox v. United States (Nov. 24) concerned three Jehovah's Witnesses who had been classified as conscientious objectors. As ministers, they claimed the right of total exemption from the draft, and they absented themselves without leave from a civilian public service camp. They were tried and convicted under the Selective Service Act. The trial judge directed the jury not to concern itself with the validity of the classification orders. On appeal to the Circuit Court of Appeals the convictions were affirmed and the Supreme Court granted certiorari. In the majority opinion, Justice Reed, joined by Vinson, Jackson and Burton, Frankfurter concurring in the result, rules that the petitioners are entitled to question the validity of selective service classifications as a defense in a prosecution for absence without leave. But he holds that a court review is allowable only where the draft board's classification has no basis in fact. Here the Court believes there was an adequate factual basis for refusing to classify the men as ministers. In one dissenting opinion, Justice Douglas, joined by Black, agrees with the majority that a review is allowable only where there is no factual basis for a classification, but he feels that here the local draft boards had no factual basis for denying the men classifications as ministers. In a second dissenting opinion Justice Murphy, joined by Rutledge, holds that a draft board classification can serve as a basis for a criminal prosecution only if it is supported by evidence of a substantial nature. To his way of thinking the evidence here is not substantial.

THE CRIME OF TREASON

In 1945, the Supreme Court for the first time in its history interpreted the treason clauses of the Constitution, which state: "Treason against the United States, shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on testimony of two witnesses to the same overt act, or on confession in open court." The opportunity came in *Cramer v. United States* (325 U. S. 1) in which the Court by a five-to-four vote set aside a treason conviction on the ground that at Cramer's trial two witnesses had testified only that the defendant had met and talked with enemy agents, and that this fell short of an adequate showing that he had given them aid and comfort. *Haupt v. United States* (March 31), like the *Cramer* case, grew out of the landing on our shores in 1942 of eight German saboteurs from an enemy submarine (see *Ex parte Quirin,* 317 U. S. 1 1942). Haupt was the father of one of these eight saboteurs and was accused of sheltering his son, and helping him get a job and purchase an auto, all with knowledge of his son's mission. The son's mission was to go to Chicago, gain employment at a plant manufacturing Norden bombsight parts, where he had once worked, and gather information for use by his fellow saboteurs. He was arrested six days after his arrival in Chicago, having been under constant surveillance by government agents. Haupt, Sr. was tried twice for the crime of treason and convicted both times. The first conviction was set aside by a Circuit Court of Appeals under the rule of the *Cramer* case (136 F2d 661). At his second trial two witnesses testified as to each of the three overt acts mentioned above. However, these acts were all covered by a single count in the indictment, and the Supreme Court agreed that a fatal deficiency as to any one of the acts must invalidate the conviction.

The majority opinion by Justice Jackson, joined by Vinson, Black, Reed, Frankfurter, Rutledge, and Burton, affirms the conviction, holding that it properly meets two tests. First, it is held that Haupt's acts really did give aid and comfort to an enemy. "They have the unmistakable quality found lacking in the *Cramer* case of forwarding the saboteur in his mission." Moreover, Haupt did not merely "act as an indulgent father toward a disloyal son." His words and actions show disloyalty to the United States, and Jackson holds that the jury could properly have concluded that "the son had the misfortune of being a chip off the old block." Second, it is held that the testimony of the two witnesses to each of the overt acts was adequate. For example, two FBI agents had testified as to the comings and goings of the two Haupts, which indicated their presence together in the father's apartment. The Court observes: "It is not necessary to show that (the son) slept in the defendant's bed. Herbert was neither trespasser nor loiterer. He entered as the licensee of his father. . . ."

In a separate concurring opinion, Justice Douglas approves the result but implies that the Court's action amounts to a repudiation of the *Cramer* rule that there must be two witnesses to an overt act which is on its face treasonable. To his way of thinking the testimony of the two witnesses need prove neither that an overt act is treasonable in intent nor treasonable on its face. These conditions can properly be inferred from all the circumstances surrounding the act.

Justice Murphy alone dissents. He asserts, ". . . an act of providing a meal to an enemy agent who is also one's son retains the possibility of having a non-treasonable basis even when performed in a treasonable setting; accordingly, it can not qualify as an overt act of treason. . . . Only when the alleged overt act manifests treason beyond all reasonable doubt can we be certain that the traitor's stigma will be limited to those whose actions constitute a real threat to the safety of the nation."

FREEDOM OF RELIGION

The First Amendment provides that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; . . ." For more than 15 years the Supreme Court has held that the Fourteenth Amendment makes the prohibitions of the First Amendment applicable to state and local governments (see *Near v. Minnesota,* 283 U. S. 697 1931). In one of the most controversial cases of the year, *Everson v. Board of Education of Ewing* (Feb. 10), the Supreme Court for the first time passed upon the "establishment of religion" clause of the First Amendment. In this case, by a five-to-four vote, the Court holds that the use of public funds to transport pupils to parochial schools does not amount to action "respecting an establishment of religion." A New Jersey statute authorizes local school districts to make rules and contracts for the transportation of school children. The Board of Education of the town of Ewing authorized by resolution the reimbursement of parents for money spent by them to transport their children by regular bus lines. The town operated no school buses of its own. Reimbursement was limited to children attending public or parochial schools (there was no showing as to whether the town contained any non-parochial private schools). Everson sued in a state court, challenging the right of the school board to reimburse parents of parochial school pupils.

The New Jersey Court of Errors and Appeals held that neither the statute nor the resolution was in conflict with the state or Federal Constitution, and Everson appealed to the United States Supreme Court. The majority opinion is by Justice Black, joined by Vinson, Reed, Douglas, and Murphy. The action of the school board is upheld as being a use of public funds for the welfare of the general public and not for the support of schools teaching religion. It is suggested that the expenditure is analogous to providing a policeman to regulate traffic near a parochial school. On the other hand, the majority opinion states: "The 'establishment of religion' clause of the First Amendment means at least this: Neither a state nor the Federal Government can set up a church. Neither can pass laws which aid one religion, aid all religions, or prefer one religion over another. . . . No tax in any amount, large or small, can be levied to support any religious activities or institutions, whatever they may be called, or whatever form they may adopt to teach or practice religion. Neither a state nor the Federal Government can, openly or secretly, participate in the affairs of any religious organizations or groups and vice versa."

There are two dissenting opinions. That by Justice Jackson, joined by Frankfurter, is brief. The school board resolution is said to be discriminatory because its benefit is limited to public and Catholic school children alone. Accordingly, the purpose would seem to be not solely to protect the welfare of children in going to and from school, but to provide aid to these schools. And it is asserted that "the Court today is unconsciously giving the clock's hands a backward turn."

Justice Rutledge, joined by Frankfurter, Jackson, and Burton, dissents at length. The decision is called a breach in the wall between church and state. And, "that . . . others will be attempted, we may be sure." There is a protest against giving "religion" a broad meaning when the issue is the constitutionality of laws, such as ordinances restricting the distribution of handbills, which are said to hamper the activities of religious groups, and a narrow meaning when the issue is the use of public funds to aid religious groups. ". . . the sphere of religious activity, as distinguished from the secular intellectual liberties, has been given . . . twofold protection and, as the state cannot forbid, neither can it perform or aid in performing the religious function." And again: "Legislatures are free to make, and courts to sustain, appropriations only when it can be found that in fact they do not aid, promote, encourage, or sustain religious teaching or observance, be the amount large or small. No such finding has been or could be made in this case."

FREEDOM OF THE PRESS

In *Bridges v. California* (314 U. S. 252 1941) and in *Pennekamp v. Florida* (328 U. S. 331 1946), the Supreme Court set aside rulings of state courts holding newspaper publishers in contempt of court because of writings criticizing court procedures. In these cases, the Court "forbade the punishment by contempt for comment on pending cases in absence of a showing that the utterances created a 'clear and present danger' to the administration of justice." The same result prevails in *Craig v. Harney* (May 19). The publisher, an editorial writer, and a reporter of three Corpus Christi newspapers were found guilty of constructive criminal contempt by a Texas court and sentenced to jail for three days. They had criticized a county judge for his handling of a local case as to which of two parties was to be the tenant of the "Playboy Cafe." They had called his action taking the case from the jury "arbitrary" and a "travesty on justice" and had claimed that a serviceman "seems to be getting a raw deal." The judge held that these statements were designed to prejudice and influence him in his ruling on a motion for a new trial, then pending. The Texas Court of Criminal Appeals affirmed the contempt ruling, and the Supreme Court granted certiorari.

The majority opinion is by Justice Douglas, joined by Black, Reed, Rutledge, and Burton. The Supreme Court makes "an independent examination of the facts" and finds that the articles "did not reflect good reporting." They gave "an unfair report of what transpired." But they did not create "any imminent or serious threat to a judge of reasonable fortitude. The vehemence of the language used is not alone the measure of the power to punish for contempt. The fires which it kindles must constitute an imminent, not merely a likely, threat to the administration of justice. The danger must not be remote or even probable; it must immediately imperil. . . . The law of contempt is not made for the protection of judges who may be sensitive to the winds of public opinion. Judges are supposed to be men of fortitude, able to thrive in a hardy climate."

There is a separate concurring opinion by Justice Murphy in which he says that for a judge "silence and a steady devotion to duty are the best answers to irresponsible criticism."

The first of two dissenting opinions is by Justice Frankfurter, joined by Vinson. He asserts that, in cases of this type, the Supreme Court should respect the judgment of the highest state court where it has reviewed the facts and has come to the conclusion that a clear and present danger exists that a judge is being intimidated by newspaper articles.

In a second dissenting opinion by Justice Jackson, it is said: "The right of the people to have a free press is a vital one, but so is the right to have a calm and fair trial free from outside pressures and influences." Jackson is worried lest the press of the country take the majority opinion to mean that the Supreme Court is indifferent toward irresponsible attacks upon courts and judges. The decision sponsors "the myth that judges are not as other men are, and that therefore newspaper attacks on them are negligible because they do not penetrate the judicial armor."

JUDICIAL REVIEW OF FEDERAL LEGISLATION

In two cases, *United Public Workers of America v. Mitchell* and *Oklahoma v. United States Civil Service Commission* (both Feb. 10), the Hatch

Act of 1940 successfully met the test of constitutionality. Section 9 of the statute forbids employees in the executive branch of the Federal Government (with certain exceptions) from taking "any active part in political management or in political campaigns." The penalty is dismissal from the public service and a ban on reemployment. Poole, a roller in the Government mint, was a ward committeeman who was active on election day as a worker at the polls. He and 11 other appellants sought injunctive relief and also a declaratory judgment against the Civil Service Commission to prevent it from enforcing the law. Justices Murphy and Jackson took no part in the case and the other justices divided four to three. The majority opinion is by Justice Reed, joined by Vinson, Frankfurter, and Burton. The Court reaches the merits only in Poole's case, holding that the other appellants have not yet been affected by the statute. It holds that Poole, as a government employee, is properly subject to a limitation of his political activities. "Congress and the President are responsible for an efficient public service. If, in their judgment, efficiency may be best obtained by prohibiting active participation by classified employees in politics as party officers or workers, we see no constitutional objection." In a brief concurring opinion, Justice Frankfurter indicates that he would dismiss all of the cases, including Poole's, for want of jurisdiction, but if the merits are to be reached he agrees that the Hatch Act is constitutional.

Justices Black, Douglas, and Rutledge dissent in varying degrees. Black would take jurisdiction in all of the cases and hold the Hatch Act unconstitutional in all. In his opinion, the statute and the Civil Service Commission regulations under it are too broad, ambiguous, and uncertain in consequences. The First Amendment is violated and possibly Article One and the Seventeenth Amendment in so far as they protect the right to vote. "I think the Constitution prohibits legislation which prevents millions of citizens from contributing their arguments, complaints, and suggestions to the political debates which are the essence of our democracy; prevents them from engaging in organizational activity to urge others to vote and take an interest in political affairs; bars them from performing the interested citizen's duty of insuring that his and his fellow citizen's votes are counted."

Justice Rutledge would take jurisdiction only in the Poole case and would hold the act invalid as applied to Poole. Justice Douglas would take jurisdiction as to all 12 appellants, believing that they should not have to wait until they are discharged before seeking clarification of their rights. In Poole's case, he would draw a careful line between industrial and administrative officers of the Government. The Hatch Act may be valid as to the latter, but is not as to the former. "Poole, being an industrial worker, is as remote from contact with the public or from policy making or from the functioning of the administrative process as a charwoman." Therefore, there is no valid reason for the Government to curb his political activities.

In the second Hatch Act case, Oklahoma objected to the enforcement of Section 12a which extends the prohibition against political activity by public officers to those state activities which are financed in whole or in part by Federal grants. France Paris, a member of the Oklahoma State Highway Commission, was also chairman of the Democratic State Committee. During the disputed period his only political activity was to help indirectly in staging a party dinner to raise funds. The United States Civil Service Commission was prepared to order a withholding of certain Federal highway funds from the state because of the violation of the law. In the majority opinion by Justice Reed, it is held that Oklahoma may properly bring an action under the Hatch Act to test its constitutionality, but that the act validly limits the political activity of such a state officer as Paris. "While the United States is not concerned and has no power to regulate local political activities as such of state officials, it does have power to fix the terms upon which its money allotments to the state shall be disbursed." Justices Black and Rutledge dissent without opinion.

In *United States v. Petrillo* (June 23), the first round in the battle between the Federal Government and James Caesar Petrillo, boss of the musicians' union, was brought to a close with the round going to the Government. On April 16, 1946, Congress passed the Lea Act which makes it unlawful to coerce a radio broadcaster to employ persons in excess of the number actually needed to operate the station (persons are forbidden "to compel a broadcaster to employ . . . any person or persons in excess of the number of employees needed by such licensee to perform actual services"). Maximum penalties under the act are a $1,000 fine and a one-year prison term.

In what was obviously intended to be a test case, Petrillo, in an attempt to force a Chicago radio station to employ three additional persons, called out the station's musicians on strike and established a picket line. Thereupon the Government prosecuted Petrillo by an information charging him with a violation of the Lea Act. A motion by Petrillo to dismiss the information was granted by the Federal district court on the ground that the statute was unconstitutional, and the Government took the case directly to the Supreme Court under the Criminal Appeals Act. Three attacks were made upon the law's constitutionality: first, that it interferes with freedom of speech contrary to the First Amendment; second, that it violates the Fifth Amendment because of the vagueness of the crime it defines, and because it denies equal protection of the laws and liberty of contract; third, that it results in involuntary servitude contrary to the Thirteenth Amendment.

Justice Douglas took no part in the case. The remaining eight justices divided five to three in upholding the statute. The majority opinion is by Justice Black, joined by Vinson, Jackson, and Burton. It is held that the issue of the statute's vagueness is properly raised, but the argument is rejected that the act is invalid because the potential offender can not know when he is forcing an employee to engage more workers than he needs. It is also held that the equal protection issue is properly raised, but the majority concludes that the act is not unconstitutional because it limits the offense to the area of radio broadcasting and is not wider in its application. However, the Court does not reach the merits as to the freedom of speech or involuntary servitude issues. It holds that the case has not progressed to the point where the Government is finally and irrevocably basing the prosecution on the use of a picket line, and that accordingly it is too early to decide whether the statute's possible use to prevent peaceful picketing violates the First Amendment. The same reasoning is used to justify the Court's refusal to consider whether the act violates the Thirteenth Amendment by forcing workers to remain at their jobs. The majority ruling in the case cleared the way for the Government to renew the prosecution of Petrillo.

Justice Frankfurter concurs in a separate opinion. The dissenting opinion is by Justice Reed, joined by Murphy and Rutledge. These three justices are of the opinion that the act fails to meet the test of constitutionality as to the issue of vagueness. "How can a man or jury possibly know how many men are 'needed to perform actual services' in broadcasting?"

JOHN L. LEWIS CONTEMPT CASE

The most sensational and controversial case of the year was that involving the review by the Supreme Court of a Federal district court ruling holding John L. Lewis and the United Mine Workers guilty of civil and criminal contempt and fining the former $10,000 and the latter $3,500,000. The case has a very complicated background. In May, 1946, the Government took possession of the coal mines under the War Labor Disputes Act of 1943 because of a labor dispute between the miners and the mine-owners. At that time Lewis and Secretary of the Interior Krug made an agreement which was to run for the period of government operation of the mines. However, in October, 1946, Lewis gave notice of a desire to negotiate a new wage settlement, purportedly under a 1945 agreement which he claimed was still in effect. The Government rejected this claim and refused to negotiate. Thereupon Lewis gave notice that the miners were terminating the Krug-Lewis Agreement as of Nov. 20, 1946, and he circulated copies of this notification among the miners for their "official information."

On Nov. 18, the Government filed a complaint in the District Court of the District of Columbia against Lewis and the United Mine Workers, asking the Court to rule under the Declaratory Judgment Act that the miners had no authority unilaterally to terminate the Krug-Lewis Agreement and requesting a temporary restraining order against such action. The Court issued the order, but under the miner's traditional "no contract, no work" policy "a full-blown strike was in progress" by Nov. 20. Thereupon the Government asked the Court to hold the defendants in contempt for violating the order. The defendants challenged the jurisdiction of the District Court, asserting that the Norris-LaGuardia Act prohibits the granting of temporary restraining orders in labor disputes even at the instance of the United States Government. The Court rejected this assertion and proceeded with the contempt trial, which resulted in a finding of guilt and the fines already mentioned. The case was then carried directly to the Supreme Court for review (*United States v. United Mine Workers,* March 6).

The majority opinion is by Chief Justice Vinson, joined by Reed, Frankfurter, Jackson, and Burton. The Court holds that the language of the Norris-LaGuardia Act divesting Federal courts of jurisdiction to issue injunctions in labor disputes does not cover the situation where the Government is the employer, and also that this state of the law was not altered by the War Labor Disputes Act. It further holds that the miners did become employees of the Government under the seizure program. Even if the Norris-LaGuardia Act does apply to the case the Court holds that a Federal court may issue a temporary restraining order in a labor dispute "for the purpose of preserving existing conditions pending a decision upon its own jurisdiction" and "its own authority to grant injunctive relief."

The Court next turns its attention to the question whether the fines were arbitrary and excessive and finds that the $10,000 fine against Lewis was warranted. But a majority holds that a proper punishment of the union for its criminal contempt would have been a $700,000 fine, and that for the purpose of coercing the union into future compliance with the lower court order the remaining $2,800,000 of the original fine should have been conditioned on the union's failure to purge itself of its contempt within a reasonable period of time. Accordingly, the Supreme Court gives the United Mine Workers five days to show that it has complied with the lower court's restraining order, by a withdrawal of Lewis' notice to Krug terminating the Krug-Lewis Agreement, and by notifying the union members of this withdrawal in "substantially the same manner" as they were notified of the cancellation of the Krug-Lewis Agreement.

Justice Jackson joins in the opinion except as to the Norris-LaGuardia Act which he thinks forbids the Federal courts to issue restraining orders in a case of this type. Justice Frankfurter in similar fashion joins in the opinion "in so far as it sustains the judgment for criminal contempt upon the broad ground of vindicating the process of law," but holds that the Norris-LaGuardia Act forbids labor injunctions even where the Government is the employer.

Justices Black and Douglas in a joint opinion hold that the Norris-LaGuardia Act does not prevent the Government from seeking an injunction in a labor dispute. But under the rule that in contempt proceedings a court should never exercise more than "the least possible power adequate to the end proposed" they hold that the penalty for criminal contempt is unjustified and that only a coercive sanction (civil contempt) should be employed. Thus the entire fine against each defendant should be made conditional on the failure of the defendants to purge themselves.

Justice Murphy in a separate dissenting opinion holds that the Norris-LaGuardia Act does forbid labor injunctions even where the Government is the employer and that furthermore the Federal courts are denied authority to issue temporary restraining orders even to preserve an existing situation while determining their jurisdiction to consider a case on its merits.

Finally, in a long dissenting opinion, Justice Rutledge holds that the Norris-LaGuardia Act forbids the order which the lower court issued in this case, and that the War Labor Disputes Act does not give the Government the right to use the injunctive weapon in seizure cases.

FEDERAL-STATE RELATIONS

In *United States v. California* (June 23), the Supreme Court heard an original suit by the Federal Government against California for a decree that it, rather than the states, has the right of ownership of lands and control of the mineral rights within the three-mile belt of ocean off the coast, and for a decree enjoining California and its lessees from trespassing. For many years California had claimed the rights at issue, had negotiated oil leases, and had received large sums in royalties and rents. In 1946, Congress passed a joint resolution quitclaiming the disputed rights to the states, but this resolution was vetoed by the President and was not repassed over his veto. In the majority opinion, Justice Black, joined by Vinson, Douglas, Murphy, Rutledge, and Burton, upholds the claims asserted by the Federal Government. ". . . national interests and responsibilities, and therefore national rights are paramount in waters lying to the seaward in the three-mile belt. . . . We decide . . . that California is not the owner of the three-mile marginal belt along its coast, and that the Federal Government rather than the state has paramount rights in and power over that belt, an incident to which is full dominion over the resources of the soil under that water area, including oil."

Justice Jackson did not participate in the case. Justices Frankfurter and Reed dissented. The former holds that the majority confuses property interest with national interest, and that, if the Federal Government is to claim a property interest in the disputed area, the political departments, Congress and the President, rather than the judicial department must make such an assertion.

Joseph v. Carter and Weekes Stevedoring Co. (March 10) is one of the latest decisions in the long line of cases in which the Supreme Court has been called upon to determine the restraining effect of the Federal commerce power upon the taxing power of the states. Here, a stevedoring company, which loaded and unloaded freight from interstate and foreign vessels in New York City, was held not liable to a state income tax on the gross proceeds of its business, which tax was not in lieu of *ad valorem* property taxes and was not apportioned to income on intrastate business alone. Stevedoring is held to be "essentially a part of commerce itself." This five-to-four decision is one of the rare instances in 1947 in which the Supreme Court held a challenged government action or policy invalid.

I. AMERICAN POLITICAL HISTORY

FEDERAL ADMINISTRATIVE AGENCIES

By John A. Tillema
Professor, The George Washington University

GENERAL

An outstanding administrative reorganization of national defense agencies was effected by the National Security Act of July 26, 1947, Public Law 253. It was the intent of Congress to provide a comprehensive program for the future security of the United States and to provide for the establishment of integrated policies and procedures for the departments, agencies and functions of the Government relating to national security. The act is divided into two sections or Titles: Title I, Co-ordination for National Security; Title II, The National Military Establishment.

NATIONAL SECURITY COUNCIL

By Sec. 101 (a) of the Act of July 26, 1947, there was established a council to be known as the National Security Council. The President of the United States will preside over the meetings of the Council and in his absence he may designate a member of the Council to preside in his place. The function of the Council is to advise the President with respect to the integration of domestic, foreign, and military policies relating to national security so as to enable the military services and other departments and agencies of the Government to cooperate more effectively in matters involving national security. The Council is composed of the President, Secretary of State, Secretary of Defense, Secretaries of the Army, Navy, and Air Forces, Chairman of the National Security Resources Board and such of the following named officers as the President may designate: the Secretaries of the Executive Department and the Chairman of the Research and Development Board. (b) In addition to performing such other functions as the President may direct, for the purpose of more effectively performing the policies of the departments and agencies of the Government relating to national security, it shall, subject to the direction of the President, be the duty of the Council: (1) to assess and appraise the objectives, commitments, and risks of the United States in relation to our actual and potential military power; (2) to consider policies on matters of common interest to departments and agencies of the Government concerning national security. (c) The Council shall have a staff to be headed by a civilian executive secretary appointed by the President. The rest of the personnel is to be selected subject to the civil service laws and regulations.

CENTRAL INTELLIGENCE AGENCY

Sec. 102 (a) of the National Security Act provides that there shall be established under the National Security Council a Central Intelligence Agency with a Director of Central Intelligence. The Director is to be appointed by the President by and with the advice and consent of the Senate. He is to receive a salary of $14,000 per annum. If a commissioned officer of the armed services is appointed Director then: (A) in the performance of his duties as Director, he shall be subject to no control, restriction or prohibition other than would be operative with respect to him if he were a civilian and in no way connected with the Departments of the Army, Navy, or Air, or the armed services; (B) he shall not possess or exercise any control, powers, or functions with respect to the armed services or of any personnel of the same.

The Director of Central Intelligence may, in his discretion, terminate the employment of any officer or employee of the agency whenever he shall deem the termination necessary or advisable in the interest of the United States, but this shall not affect the right of such officer or employee to seek or accept employment in another department or agency of the Government if declared eligible by the Civil Service Commission. The powers of the Director are bestowed for the purpose of coordinating the intelligence activities of the several government departments in the interest of the national security. The National Intelligence Authority was abolished, and the property and records were transferred to the Central Intelligence Agency.

NATIONAL SECURITY RESOURCES BOARD

This Board is to be composed of a Chairman and such heads or representatives of the various departments and agencies as may be designated from time to time by the President. The Chairman is to receive $14,000 per annum. He is empowered, subject to the direction of the President and in accordance with the Civil Service laws and the Classification Act of 1923, to appoint and fix the compensation of the necessary personnel.

It is the function of the Board to advise the President concerning the coordination of military, industrial, and civilian mobilization. In performing its functions, the Board shall utilize to the maximum extent the resources of the departments and agencies of the Government.

THE NATIONAL MILITARY ESTABLISHMENT

Under Title II of the National Security Act of July 26, 1947, the defense departments were coordinated into a single new establishment known as the National Military Establishment. At the head of the new Establishment is placed the Secretary of Defense. The National Military Establishment includes the Department of the Army, Department of the Navy, and Department of the Air Forces.

SECRETARY OF DEFENSE

The Secretary of Defense, the head of the National Military Establishment is appointed from civilian life by the President by and with the advice and consent of the Senate. A person who within ten years shall have been on active duty as a commissioned officer is ineligible for the appointment. The Secretary of Defense is the principal assistant to the President in all matters pertaining to national security. The duties of the Secretary of Defense are: 1. to establish general policies and programs for the National Military Establishment; 2. to exercise general direction, authority and control over such departments and agencies; 3. to take appropriate steps to eliminate unnecessary duplication or overlapping in the fields of procurement, supply, transportation, storage, health, and research; and 4. to supervise and coordinate the preparation of the budget estimates of the departments and agencies comprising the National Military Establishment, formulate and determine the budget estimates for submittal to the Bureau of the Budget and supervise the budget programs of such departments and agencies under the applicable appropriation act, provided, however, that the Secretary of the Army and the Secretaries of the Navy and Air Forces may present recommendations to the President or Director of the Budget after first so informing the Secretary of Defense.

Officers of the armed services may be detailed to duty as assistants and personal aids to the Secretary of Defense, but he shall not establish a military staff. The Secretary of Defense may have not more than three special assistants from civilian life.

WAR COUNCIL

There shall be with the National Military Establishment a War Council composed of the Secretary of Defense as Chairman, who shall have power of decision; Secretary of the Army; Secretary of the Navy; Secretary of the Air Forces; Chief of Staff, United States Army; Chief of Naval Operations and the Chief of Staff, United States Air Force. The War Council shall advise the Secretary of Defense on matters of broad policy relating to the armed forces, and shall consider and report on such other matters as the Secretary of Defense shall direct.

JOINT CHIEFS OF STAFF

There is created within the National Military Establishment the Joint Chiefs of Staff, which consists of the Chief of Staff, United States Army; the Chief of Naval Operations; the Chief of Staff, United States Air Forces; and the Chief of Staff of the Commander in Chief, if there is one.

It is the duty of the Joint Chiefs of Staff: 1. to prepare strategic plans and to provide for the strategic direction of the military forces; 2. to prepare joint logistic plans and to assign to the military services logistic responsibilities in accordance with such plans; 3. to establish unified commands in strategic areas when such unified commands are in the interest of the national security; 4. to formulate policies for the joint training of the military forces; 5. to formulate policies for coordinating the education of members of the military forces; 6. to review major material and personnel requirements of the military forces, in accordance with strategic and logistic plans; and 7. to provide United States representation on the Military Staff Committee of the United Nations in accordance with the provisions of the Charter of the United Nations.

The Joint Chiefs of Staff shall act as the principal military advisers to the President and the Secretary of Defense and shall perform such other duties as the Secretary of Defense may direct or as may be prescribed by law.

JOINT STAFF

The Joint Staff will comprise, not to exceed 100, officers chosen in approximately equal numbers from the three armed services. They will operate under a Director appointed by the Joint Chiefs of Staff. The Director will be an officer junior in grade to all the members of the Joint Chiefs of Staff.

MUNITIONS BOARD

There is a Munitions Board in the National Military Establishment. Its Chairman is selected from civilian life by the President and shall receive a compensation of $14,000 per annum. The three other members are Under-Secretaries or Assistant Secretaries of each of the three military departments. The duties of the Board under the direction of the Secretary of Defense and in support of strategic and logistic plans prepared by the Joint Chiefs of Staff are:

1. To coordinate the appropriate activities within the National Military Establishment with regard to matters including the production, the procurement and distribution plans of the departments and agencies comprising the Establishment.

2. To plan for the military aspects of industrial mobilization.

3. To recommend assignment of responsibility for procurement among the several military services and to plan for standardization of specifications and for the best practicable purchase authority of technical equipment and common use items on the basis of single procurement.

4. To prepare estimates of potential production, procurement, and personnel for use in evaluation of the logistic feasibility of strategic operations.

5. To determine relative priorities of the various segments of the military procurement programs.

6. To supervise such coordinate agencies as are or may be created to consider the subjects falling within the scope of the Board's responsibilities.

7. To make recommendations to regroup, combine or dissolve existing inter-service agencies operating in the field of procurement, production and distribution in such manner as to promote efficiency and economy.

8. To maintain liaison with other de-

partments and agencies for the proper correlation of military requirements with the civilian economy, particularly with regard to the procurement or disposition of strategic and critical material and the maintenance of adequate reserves of such material, and to make recommendations thereon to the Secretary of Defense.

9. To perform such other duties as the Secretary of Defense may direct.

The Secretary of Defense provides the Board with such personnel and facilities as the Secretary may deem to be required by the Board for the performance of its functions.

RESEARCH AND DEVELOPMENT BOARD

This Board within the National Military Establishment is composed of a Chairman, as head, and two representatives of each of the departments of the Army, Navy, and Air Forces to be designated by the Secretaries of their respective departments. The purpose of this Board is to advise the Secretary of Defense as to the status of scientific research relative to the national security. It is the duty of the Board, under the direction of the Secretary of Defense—

1. To prepare a complete and integrated program of research and development for military purposes.

2. To advise with regard to trends in scientific research relating to national security and the measures necessary to assure continued and increasing progress.

3. To recommend measures of coordination of research and development among the military departments and the allocation among them of responsibilities for specific programs of joint interest.

4. To formulate policy for the National Military Establishment in connection with research and development matters involving agencies outside of the National Military Establishment.

5. To consider the interaction of research development of strategy and to advise the Joint Chiefs of Staff in connection therewith.

ADVISORY COMMITTEES AND PERSONNEL

The Secretary of Defense, the Chairman of the National Security Resources Board, and the Director of National Intelligence are authorized to appoint such advisory committees and to employ, consistent with the other provisions of the act, such part-time advisory personnel as they may deem necessary in carrying out their respective functions and the functions of the agencies under their control.

FUNCTIONS OF THE ARMED FORCES

Immediately after the National Security Act was enacted by Congress, by executive order of July 29, 1947, the President, as Commander in Chief of the armed forces of the United States, listed the primary functions and responsibilities of each of three armed services: Army, Navy and Air. He supplemented the enumerated list of combined functions and individual functions of each service with the statement: "To assist the other services in the accomplishment of their missions, including the provision of common services and supplies as determined by proper authority."

NATIONAL SECURITY RESOURCES BOARD

By order of Nov. 13, 1947, the President designated as members of the Board, the Secretary of the Treasury, Secretary of Defense, Secretary of the Interior, Secretary of Agriculture, Secretary of Commerce, and Secretary of Labor to be members of the Board. The Chairman of the Board is to be responsible for the direction of the work and staff of the Board, including among other things, the preparation and accumulation of factual data necessary to the formulation of plans, policies, and programs, and for the submission of such reports to the Chairman of the Board.

Pursuant to the request of the Board, all Federal departments and agencies shall furnish the Board such information, reports, statistics, and other data or documents in their possession or under their control or obtainable by them, all in the performance of their normal and lawful functions, and make for the Board such studies, investigations, and reports as are in the judgment of the Board necessary or desirable to fulfill the duties and accomplish the functions and purposes as prescribed by the National Security Act of 1947.

INTERIM ADMINISTRATION FOR THE TRUST TERRITORY OF THE PACIFIC ISLANDS

By Executive order of July 22, 1947, the military government in the former Japanese mandated islands was terminated, and the authority and responsibility for the civil administration of the trust territory, on an interim basis, was delegated to the Secretary of the Navy. The Secretary of the Navy shall, subject to such policies as the President may from time to time prescribe, and when appropriate, in collaboration with other departments or agencies of the Federal Government, carry out the obligations which the United States, as administering authority of the trust territory, has assumed under the terms of the agreements and the Charter of the United Nations; provided, however, that the authority granted to the United States under Article 13 of the agreement to close any areas for security reasons and to determine the extent to which Articles 87 and 88 of the Charter of the United Nations shall be applicable to such closed areas, shall be exercised jointly by the Secretary of the Navy and the Secretary of State. All relations between departments or agencies of the Federal Government and appropriate organs of the United Nations with respect to the trust territory shall be conducted through the Secretary of State. This order, subject to subsequent modification, shall remain effective until a designation is made of the civilian department or agency which is to have the permanent responsibility for the government of the trust territory.

FOREIGN PATENTS

By Executive Order of June 17, 1947, the President directed:

1. All government departments and agencies shall, whenever practicable, acquire the right to file foreign patent applications on inventions resulting from research conducted or financed by the Government.

2. All government departments and agencies which have, or may hereafter acquire title to inventions or the right to file patent applications abroad thereon, shall fully and continuously inform the Department of Commerce concerning such inventions, except those within the jurisdiction of the Atomic Energy Commission, unless the Commission specifically authorizes the inclusion, or other inventions officially classified as secret or confidential for reasons of national security; and shall make recommendations to the Department of Commerce as to which of such inventions should receive patent protection by the United States abroad and the foreign jurisdictions in which such patent protection should be sought. The recommendations of such departments and agencies shall indicate the immediate future industrial, commercial, or other value of the invention concerned, including its value to the public health.

3. The Department of Commerce shall determine whether and in what jurisdictions, the United States should seek patents for such inventions and, to the extent of the appropriations available therefor, shall secure patent protection for such inventions, taking all action consistent with existing law, necessary to acquire and maintain patent rights abroad. Such determination of the Department of Commerce shall be made after full consultation with United States industry and commerce, with the Department of State and with other government agencies familiar with the technical, scientific, industrial, commercial, or other economic or social factors affecting the invention involved, and after consideration of the availability of valid patent protection in the countries determined to be immediate or

potential markets for, or producers of the products, processes or services covered by or relating to the invention.

4. The Department of Commerce shall administer foreign patents acquired by the United States under the terms of the Order and shall issue licenses thereunder in accordance with law and such rules and regulations as the Secretary of Commerce shall prescribe. Nationals of the United States shall be granted licenses on a non-exclusive royalty free basis except in such cases as the Secretary shall determine and proclaim it to be inconsistent with the public interest to issue such licenses on a non-exclusive royalty free basis.

5. The Department of State, in consultation with the Department of Commerce, shall negotiate arrangements among governments under which each government and its nationals shall have access to the foreign patents of the other participating governments. Patents relating to matters of public health may be licensed by the Secretary of Commerce, with the approval of the Secretary of State, to any country or its nationals upon such terms and conditions as are in accordance with law and as the Secretary of Commerce determines to be appropriate, regardless of whether the country is a party to the arrangements.

TRANSFERS TO ATOMIC ENERGY COMMISSION

The first Executive order to go into effect in the year, 1947, was the one which ordered the transfer to the Atomic Energy Commission of all the interests of the United States or any government agency in: 1. All fissionable material, all atomic weapons and parts thereof; all facilities, equipment for the processing, production or utilization of fissional materials or atomic energy; all processes and technical information of any kind and the source thereof, including data, drawings, specifications, patents, patent applications etc., relating to the processing, production or utilizationable material or atomic energy; and all contracts, leases, agreements, patents, applications for patents, inventions and discoveries, patented or unpatented, and all other rights concerning such items. 2. All facilities, equipment and materials devoted primarily to atomic energy research and development.

There was also transferred to the Atomic Energy Commission all property, real and personal, tangible or intangible, including records owned by the Manhattan Engineer District, War Department, in addition to the property described in paragraph one. Specific of such property could be excluded from transfer to the Commission in the following manner: (a) The Secretary of War should notify the Commission in writing as to the specific items of property or records he wished to except; and (b) if, after full examination of the facts by the Commission, it concurred in the exception, those specific items of property or records should be excepted from transfer to the Commission; or (c) if after full examination of the facts the Commission did not concur in the exception, the matter should be referred to the President for decision. The Atomic Energy Commission shall exercise full jurisdiction over all interests and property transferred to it in accordance with the provisions of the Atomic Energy Act of 1946.

There were also transferred to the Commission all civilian officers and employees of the Manhattan Engineer District, except that the Commission and the Secretary of War might by mutual agreement exclude any of such personnel from transfer to the Commission. The military and naval personnel heretofore assigned or detailed to the Manhattan Engineer District, War Department was continued to be available to the Commission, for military and naval duty without prejudice to the military or naval status of such personnel for such time as might be mutually agreed by the Commission and the

Secretary of War or the Secretary of the Navy.

FEDERAL HOUSING EXPEDITER

This office was formerly merged in that of the Federal Housing Administrator, but since it was found necessary that his powers, duties and functions be segregated, an Expediter was appointed as an independent officer of the Government. Under the authority of the Veteran's Emergency Housing Act of 1946, the President ordered as follows: 1. that all the powers, functions, and duties of the Housing Expediter, which were merged with the powers, functions, and duties of the National Housing Administrator, be segregated and be exercised and performed by the Housing Expediter as an independent officer; 2. that all the personnel (as determined by the joint certification of the Housing Expediter and the National Housing Administrator) be transferred to the Office of the Housing Expediter. The joint certifications required were to be made within 30 days from the date of the order; 3. that all assets, contracts and property, including office equipment and records pertaining to the functions and duties of the Expediter, be transferred to the Office of Housing Expediter; 4. that the Director of the Bureau of the Budget supervise the transfer of the proper funds to be allocated to the new office.

BOARD OF WAR COMMUNICATIONS

By Executive order of Feb. 24, 1947, the Board of War Communications was abolished and all the property and records transferred to the Federal Communications Commission.

SURPLUS PROPERTY OFFICE, DEPARTMENT OF THE INTERIOR

By Executive order of Feb. 21, 1947, the Surplus Property Office of the Department of the Interior was transferred to the War Assets Administration. The War Assets Administrator was permitted at his discretion to terminate the Office transferred as a separate organizational entity with the War Assets Administration.

FEDERAL PERSONNEL ADMINISTRATION

By Order 9830 of Feb. 24, 1947, President Truman amended the Civil Service Rules and provided for Federal Personnel Administration. The Order revoked 50 enumerated orders issued from Nov. 29, 1904 to June 4, 1946. The Order declares that personnel management is a primary responsibility of all who plan, direct or supervise the work of Federal employees. Personnel management methods should be consistent for the Government as a single employer and yet should be sufficiently flexible to meet the diversified conditions in the Federal service.

CIVIL SERVICE COMMISSION RESPONSIBILITY

The Commission is responsible to the President for the proper application of the Civil Service Act and Rules, the Veteran's Preference Act, and all other applicable statutes and executive orders imposing responsibility on the Commission. The Commission is directed to exercise and provide leadership in personnel matters throughout the Federal service, and, in discharge of this responsibility shall, whenever practicable, consult Federal agencies.

The Commission shall develop and promulgate standards applicable to the competitive service and designed to protect and promote its efficiency, for the reinstatement or reemployment of former Federal employees and for the promotion, demotion, reassignment and transfer of present employees. The Commission shall also define the restoration rights of persons who left the Federal service to enter the armed forces of the United States in such manner as to give full effect to Section 8 of the Selective Service and Training Act.

The Commission is required to prescribe procedures to be followed by agencies in connection with removals, demotions, and suspensions in the competitive service which will insure equitable and uniform treatment to employees against whom adverse action is proposed.

The Commission shall when consistent with law and with economical and efficient administration of the Government, delegate to the agencies its authority to act in personnel matters in accordance with the standards issued by the Commission.

The Commission shall maintain an adequate system of inspection to determine that equitable and sound application of statutes, executive orders, regulations, and standards relating to personnel matters are being carried out by the agencies. Whenever the inspection indicates failure on the part of agency to adhere to established policies, regulations, and standards, the Commission shall take such action as may be appropriate to bring about adherence thereto. In this connection, the Commission may suspend or revoke any delegation of its authority.

The Commission shall in the exercise of its personnel functions give all practicable assistance to international organizations in which the United States participates, to the Puerto Rico Civil Service Board, and to such Federal, Territorial, State, or local agencies as shall request its cooperation and offer like cooperation, including, when appropriate, the sharing of any necessary expenses.

AGENCY RESPONSIBILITY FOR PERSONNEL MANAGEMENT

The head of each agency, in accordance with the applicable statutes, executive orders, and rules shall be responsible for personnel management within the agency. To assist and advise him in carrying out this responsibility, he shall maintain or establish such office or division of personnel as may be required. He shall designate a director of personnel or other similarly responsible official to be in charge of such office or division. Such director or other official shall represent the head of the agency in personnel matters, subject to his instruction.

The head of each agency shall provide for the cooperation of his agency with the Civil Service Commission in the conduct of personnel matters.

Authority for the conduct of personnel matters within each agency shall be delegated to the extent compatible with the provisions of law and with economical and efficient administration to those officials responsible for planning, directing, and supervising the work of others. The exercise of such delegated authority shall be subject to policies, rules, regulations, and standards established by the head of the agency, and shall be subject to appropriate review and inspection.

The head of each agency shall remove, demote, or reassign to another position any employee in the competitive service whose conduct or capacity is such that his removal, demotion, or reassignment shall promote the efficiency of the service.

FEDERAL PERSONNEL COUNCIL

The Council of Personnel Administration shall hereafter be known as the Federal Personnel Council and shall be continued within the Civil Service Commission. Its functions are to be advisory to the Commission. It is to be composed of representatives of the departments and agencies.

LOYALTY PROGRAM

An Executive Order of March 25, 1947 prescribed the procedures for the administration of an employees' loyalty program in the executive branch of the Government. The Order directed that there should be a loyalty investigation of every person entering the civilian employment of any department or agency. The program is to be conducted by the Civil Service Commission except as covered by a special agreement between the Commission and any department or agency of the Federal Government. The investigation of persons other than those entering the competitive service is to be conducted by the employing department or agency. Departments or agencies without investigative organizations were directed to use the investigative facilities of the Civil Service Commission.

The foregoing, Part I, deals with those persons who are seeking admission to Federal Administrative service. Part II of the Order applies to those persons who are already in the employment of the United States. Part II provides that the head of each department and agency in the executive branch of the Government shall be personally responsible for an effective program to assure that disloyal civilian officers or employees are not retained in the employment of his department or agency. He is held responsible for prescribing and supervising the loyalty determination procedures of his department or agency in accordance with the provisions of the Order which shall be considered as providing minimum requirements. The head of a department or agency without an investigative agency is directed to use the investigative facilities of the Civil Service Commission.

The head of each department or agency is required to appoint one or more loyalty boards, each composed of not less than three members. Officers or employees charged with disloyalty are given a right to an administrative hearing before a loyalty board. They are entitled to a written notice of charges and may be accompanied by council or representation of their choosing.

The right of hearing, notice thereof, and an appeal therefrom shall be accorded to every officer or employee prior to removal on grounds of disloyalty, irrespective of tenure or method or nature of appointment, but the head of the employing department or agency may suspend any officer or employee at any time pending a determination with respect to loyalty.

LOYALTY REVIEW BOARD

There must be a Loyalty Review Board in the Civil Service Commission. This Board must have not less than three impartial members who shall be officers and employees of the Civil Service Commission. Part IV of the Order deals with the security measures to be observed in investigations, and Part V, with the standards to be applied.

SOLID FUELS ADMINISTRATION FOR WAR

By Executive Order of May 6, 1947, the authority of the Solid Fuels Administrator was terminated. The Secretary of the Interior, acting through the Solid Fuels Administration for War until its abolition, and thereafter, though such agency or agencies of the Department of the Interior as the Secretary of the Interior might designate, is authorized to liquidate its affairs as expeditiously as practicable.

HOUSING AND HOME FINANCE AGENCY

The plan for this new agency was submitted by President Truman to the Senate and House of Representatives in Congress assembled on May 27, 1947, under the caption: Reorganization Plan 3 of 1947. This reorganization plan recommended to Congress that The Home Owners Loan Corporation, Federal Savings and Loan Insurance Corporation, Federal Housing Administration, United States Housing Authority, Defense Homes Corporation, and United States Housing Corporation, together with their respective functions, and the functions of the Federal Home Loan Bank Board be merged in a new agency to be known as: The Housing and Home Finance Agency.

RECIPROCAL TRADE AGREEMENTS PROGRAM

By Executive Order 9832, Feb. 25, 1947, President Truman outlined the procedures to be followed for the administration of reciprocal trade agreements. The Order is divided into three Parts. Part I provides that there shall be included in every trade agreement hereafter entered into under the authority of the Act of June 12, 1934, as amended, a clause providing that, if, as a result of unforeseen developments, such article is being imported in such increased quantities and under such conditions as to cause or threaten serious injury to domestic producers of like or similar articles, the United States shall be free to withdraw the concession in whole or in part or to modify it, to the extent and for such time as may be necessary to prevent such injury.

The United States Tariff Commission, upon the request of the President, upon its own motion or upon the application of any interested party when in the judgment of the Tariff Commission there is good and sufficient reason therefor, shall make an investigation and report to the President. In the course of any investigation the Tariff Commission shall hold public hearings, giving reasonable public notice thereof, and shall afford reasonable opportunity for parties interested to be present, to produce evidence, and to be heard at such hearings.

The Tariff Commission is required to keep informed concerning provisions relating to duties and other import restrictions in trade agreements, and at least once a year shall submit to the President and to the Congress a factual report on the operation of the trade agreements program.

Part II of the Order provides for an Interdepartmental Committee consisting of representatives of the Tariff Commission, and the Departments of State, Treasury, War, Navy, Agriculture, Commerce, and Labor. The Chairman of the Committee is the representative of the Department of State. The duty of the Interdepartmental Committee is to make recommendations to the President concerning items to be included in trade agreements.

Part III of the Trade Agreements Order directs that there shall be included in every trade agreement, hereafter entered into by the United States, a most favored nation provision securing for the exports of the United States the benefits of all tariff concessions and other tariff advantages hereafter accorded by the other party or parties to the agreement to any third state. This provision shall be subject to a minimum of necessary exceptions and shall be designed to obtain the greatest possible benefits for exports from the United States.

The Interdepartmental Committee shall take note of any discriminations by other countries against the trade of the United States which can not be removed by normal diplomatic representations, and, if the public interest will be served thereby, shall recommend to the President the withdrawal from such state of the benefits of concessions.

ELECTIONS OF 1947

By David B. Truman
Professor, Williams College

GENERAL

Elections in the off-year 1947 involved only a few statewide contests, most balloting involving municipal and township officials. Of the seven states which elected state officials, Kentucky and Mississippi produced results of more than local interest. Kentucky's gubernatorial contest and the race for United States Senator in Mississippi attracted most attention. In the other five states—Michigan, New Jersey, Pennsylvania, Virginia, and Wisconsin—only state legislators, judges, and minor administrative officials appeared on the ballots. Various county officers were voted for in ten states. Of 92 cities of over 100,000 population, 73 held elections for one or more city offices. Election results and related developments in a few such urban centers were notable. Renewed controversy over the role of organized labor in elections, especially at the national level, was stimulated by Federal legislation on the subject.

KENTUCKY

Interest in the Kentucky election on Nov. 4 was focused on the governorship, where a Democrat, Earle C. Clements, Representative in Congress for the Second District, was chosen to succeed Simeon S. Willis, first Republican governor of the state since 1931. Clements defeated Attorney-General Eldon S. Dummit by a margin of 125,000 votes, a normally large Democratic margin. The controversial Taft-Hartley Labor Act, which Clements had opposed in Congress, figured prominently in the campaign. Conflicting and inconclusive claims were made by both sides on the validity of the election as a test of the popularity of this act.

MISSISSIPPI

A successor to the late Theodore G. Bilbo was elected to the Senate from Mississippi on Nov. 4 in a race which involved five Democratic contestants. Circuit Judge John C. Stennis led the field with more than 47,000 votes. The unsuccessful Democratic candidates included W. M. Colmer, Representative from the Sixth Congressional District; Paul B. Johnson, Jr.; Forrest B. Jackson, close associate of the late Senator; and John E. Rankin, veteran Representative from the First Congressional District. Rankin trailed the other Democratic aspirants. The Republican, L. R. Collins, received 508 votes.

CHICAGO

Among local contests, the Chicago mayoralty election of April 1 held most interest for its bearing on national politics. After losing most of the county offices to the Republicans in the 1946 elections, the Democrats elected Martin H. Kennelly to succeed Edward J. Kelly as the city's chief executive. The successful candidate defeated Russell W. Root, Chairman of the Republican County Committee, by a majority of 278,000. Although strictly local issues were of considerable importance in the campaign, Democrats took heart from the fact that, with the largest voter turnout in any mayoralty election in the city's history, their candidate built up a larger plurality than those which had been received by Mayor Kelly in the two previous elections for the top city position, in 1939 and 1943.

NEW YORK

Two developments in New York which may have significance for national elections occurred during the year. The state legislature passed the so-called Wilson-Pakula law, which prohibits a person from entering a primary election of a party of which he is not a regularly enrolled member, except with the permission of the appropriate party committee. It was aimed at preventing members of such minority groups as the American Labor Party from winning major-party endorsement for their candidates over the protest of major-party organizations. The constitutionality of the act was upheld by the Court of Appeals in July in three test cases, of which two were initiated by American Labor Party members and the third by a Democrat.

A second development which weakened minor party organizations in the state was the adoption by voters of New York City on Nov. 4 of a referendum proposal to repeal the provision for the election of members of the City Council by proportional representation. Thus, after a trial of ten years' duration, this election method was dropped by the only city of more than 500,000 in which it had been adopted. The proportional representation provision had been in force since the approval of the new city charter in 1936. Members of the next council, to be elected in 1949 will be chosen from 25 single-member districts identical with the city's state senate districts. The majority for the repeal proposal was 350,000 out of 1,523,000 votes cast.

CORRUPT PRACTICES AMENDMENT IN TAFT-HARTLEY ACT

The Labor Management Relations Act of 1947, popularly known as the Taft-Hartley Act, contains a provision (section 304) making it unlawful for any labor organization to make a contribution or expenditure in connection with any election in which presidential or vice-presidential electors or a Senator or Representative are to be voted for, or in connection with any primary election or political convention or caucus which selects candidates for those offices. This provision, which amends the Federal Corrupt Practices Act, has been bitterly criticized by leaders of organized labor. It was openly challenged in several Congressional by-elections, the first of which occurred in Maryland's third district on July 15. In that district, E. A. Garmatz was elected to fill out the term of Congressman Thomas D'Alesandro, Jr., resigned. Prior to the election President Philip Murray of the CIO published an endorsement of the successful candidate in the *CIO News,* with the avowed purpose of inviting a test of the constitutionality of this portion of the act. No enforcement action was taken by the Department of Justice during the year, but there were repeated reports of the likelihood of such action on the basis of this or other alleged violations of the Act. Announced plans by all of the major labor organizations to take an openly active part in the 1948 elections also indicate that a political, if not judicial, test of the provision will be forthcoming in the near future.

DIVISION II

INTERNATIONAL AFFAIRS AFFECTING THE UNITED STATES

THE UNITED NATIONS

By Winifred N. Hadsel
Research Associate, Foreign Policy Association

GENERAL

During 1947 the differences between Russia and the Western Powers dominated most of the sessions of the various organs of the United Nations and put the world organization to a series of critical but inconclusive tests. On the one hand, the very fact that the United Nations survived the struggle between East and West indicated that both sides felt that the organization could continue to serve a useful purpose. At the same time, however, it seemed clear that a further growth of international tensions would make it extremely difficult, if not impossible, for the UN to function effectively in the future.

THE GREEK ISSUE

The Security Council, whose 1947 membership consisted of representatives of Australia, Brazil, Poland, Belgium, Colombia, and Syria, in addition to its five permanent members (United States, U.S.S.R., United Kingdom, China, and France), was particularly affected by the clash between Russian and American interests. One of the principal issues complicated by this clash was the troubled situation in Greece (see "United States and Europe"). On Dec. 3, 1946, the Greek government, charging that the pro-Soviet régimes of Albania, Bulgaria, and Yugoslavia were aiding the Communist-led Greek guerrillas against the Greek army, asked the Security Council to take steps which would halt this interference in the internal affairs of Greece. Following the presentation of this request, the United States proposed that an on-the-spot commission composed of representatives of the 11 members of the Security Council conduct a survey to ascertain the facts involved in the Greek situation. This suggestion was unanimously adopted Dec. 19, 1946, and the first investigation body to be established by the UN was thus created.

The UN Balkan Commission held its first meeting in Athens Jan. 30, 1947, and completed its investigation with a meeting in Belgrade April 2. In the interim, it held a total of 73 sessions in the Balkans, 60 of which took place in Greece, six in Bulgaria, and seven in Yugoslavia. The Commission then proceeded to Geneva April 7 to draft its report, which was adopted May 23 and transmitted to the Security Council for consideration. In the meantime, the Security Council established a special subsidiary group which remained in Salonika in order to report on border violations which might be brought to its attention during the period after the Commission left Greece and before the Security Council recommended action on the Greek case.

The assignment of the UN Balkan Commission was rendered particularly difficult by the sharp differences which existed between the representatives of Russia and Poland, on the one hand, and the nine other members of the Commission. At the outset a heated controversy developed between these two groups in connection with the question of the proper scope of the Commission investigation. The Russian representative maintained that the Commission should confine itself to a study of the Greek internal situation, which, he asserted, was the sole source of the difficulties existing between Greece and its northern neighbors. The United States delegation (headed by Mark F. Ethridge, publisher of the *Louisville-Courier*) insisted, on the contrary, that Greece's internal problems were by no means the only cause of the disturbed conditions along the Greek frontier. The great majority of clashes between guerrillas and Greek authorities, he pointed out, had taken place in the northern provinces of Greece. After a period of extended debate within the Commission the American delegation won support for its view on this point of all the members of the Commission except Russia and Poland, and a broad inquiry was conducted.

The differences within the Balkan Commission were further revealed in its conclusions and recommendations. In one set of conclusions, strongly supported by the United States and seven other members of the Commission (France abstained and Russia and Poland filed a minority report), the charges which Greece had made against its northern neighbors were upheld. According to the findings set forth in this report, Yugoslavia had armed and trained refugees from Greece within its borders and subsequently dispatched them to Greece for action there. Albania, they declared, had likewise received and trained a number of Greek Leftist refugees and supplied them with arms and ammunition. Bulgaria's role was defined as primarily that of a corridor which Greek guerrillas used in moving between Yugoslavia and Greece, rather than as a source of military training, arms, and other equipment.

The majority of the Commission, having concluded that Yugoslavia, Albania, and Bulgaria had interfered in Greek internal affairs, recommended that instances of "future support of armed bands formed on the territory of one state and crossing into the territory of another" should automatically be considered "a threat to peace." According to the terms of the Charter, this meant that such offenses might be dealt with by means of a series of "last resort" measures, including diplomatic pressure, economic sanctions, or even the use of international armed force. Realizing the desirability, however, of using less drastic measures, also recognizing the probability that Russia would veto proposals for strong action against its satellites, the Commission proposed a series of other measures for easing the tension between Greece and its neighbors.

Among these proposals by far the most important was the suggestion that the UN should maintain a watch on the troubled Greek border area by establishing a semi-permanent Balkan frontier commission. This body, it proposed, should remain in existence for at least two years and be empowered not only to investigate any border violations that might occur, but to use its good offices in settling border controversies arising between Greece and its neighbors. However, Russia and Poland rejected these recommendations and maintained that the Greek charges against Yugoslavia, Albania, and Bulgaria were entirely unfounded.

The Security Council began its debate on the Balkan Commission Report June 27. The Council soon found, however, that Russia's objections made it impossible to take action along the lines proposed by the investigatory body. Under these conditions the United States concluded that the Security Council was unable to cope with the Balkan issue. In a search for some other way whereby the UN could deal with the Greek situation, the United States placed the problem on the agenda of the General Assembly (see "General Assembly").

INDONESIA

The Security Council enjoyed its greatest success of the year in connection with the undeclared war between The Netherlands and the Republic of Indonesia. Following the outbreak of hostilities between the Dutch and Indonesians on July 21, Australia and India brought this situation to the attention of the Security Council (July 30). In one of its swiftest actions on record, the Council decided, August 1, to call on the parties concerned to cease hostilities at once, to settle their dispute by arbitration or other peaceful measures, and to keep the Council informed concerning the progress of their settlement. Since this action, which was taken following an 8-0 vote (France, Belgium, and Britain abstaining), constituted a clear-cut demand that a war already in progress be halted, it was widely acclaimed as an indication that the UN was capable of acting vigorously and swiftly. Viewed, however, as a means of settling the Dutch-Indonesian conflict, the Security Council's action soon proved highly inadequate. Not only did the Council fail to provide UN supervision of its order to cease hostilities, but it offered no assistance to the disputants in reaching an agreement.

Although the Dutch and Indonesian governments issued cease-fire orders for midnight, August 4-5, both parties subsequently complained that the truce was being violated. In an effort, therefore, to secure compliance with its earlier request the Security Council decided, August 26, not only to call upon the two governments to maintain their truce but to ask the representatives of Council members in Batavia to report on the situation in the area. In addition, the Council offered to appoint a committee which would tender its good offices for peaceful settlement of the dispute. This Committee of Good Offices, as subsequently constituted, consisted of Australia, selected by Indonesia; Belgium, named by The Netherlands; and the United States, chosen by Australia and Belgium.

When the Consular Commission reported (Sept. 22) that the cease-fire orders were still not fully effective, the Security Council urged the Dutch and Indonesians to consult with each other, either directly or through the Committee of Good Offices. As a result, the two governments concerned named special representatives who began, Nov. 15, to meet with the committee. These meetings culminated in an agreement designed to ensure observance of the previously announced truce. In this connection both parties agreed to refrain from broadcasts or any other form of propaganda aimed at provoking or disturbing troops and civilians. They also promised to cease the publication of daily operational communiques or any other information concerning military operations unless by prior mutual agreement in writing. They further pledged themselves to give the advisers of the Committee of Good Offices full opportunity to observe and inform all troops and civilians of the existing situation. In another effort to relax existing tensions, they accepted the principle that prisoners should be released without regard to the number of prisoners held by either party.

Having succeeded in creating a more favorable atmosphere for the maintenance of the truce between the Dutch and Indonesians, the Committee of Good Offices brought the two disputants together, Dec. 8, for formal discussions. At the close of the year it appeared that these negotiations, which were held on board the *U.S.S. Renville,* a Navy transport anchored in Batavia harbor, would lead to the successful conclusion of a military agreement. Once achieved, such an agreement could pave the way for a political settlement of the dispute between The Netherlands and the Republic of Indonesia as to the place of the latter in the federated United

States of Indonesia which the Dutch proposed to establish. Under the terms of the truce it is likely that a plebiscite will be held throughout the Netherlands East Indies to determine whether the inhabitants of various disputed areas wish to become part of the Indonesian Republic or prefer to be represented by other republics. It also seems probable that the Security Council will send observers to supervise such a plebiscite and to report on compliance with other terms of the truce.

CORFU CHANNEL INCIDENTS

A dispute between Britain and Albania, which threatened to lead to serious international consequences, constituted another problem dealt with by the Security Council. The source of this dispute was an incident which occurred in the Corfu Channel Oct. 22, 1946, when two British warships were damaged by mines, with resulting loss of life and injury to their crews. Britain maintained that the Albanian government was responsible for the incident and requested an apology and compensation. Failing to receive satisfaction, Britain brought the matter to the attention of the Security Council Jan. 10, 1947. Following an extended debate Britain submitted a draft resolution, which, as amended by the United States and France, would have placed the Security Council on record as finding that the laying of mines in peacetime without notification was an offense against humanity, and that the minefield in question could not have been laid without the knowledge of the Albanian authorities. This finding, the resolution continued, should form the basis for a settlement of the dispute by the Albanian and British governments, and in the event of failure to settle, either party might apply to the Council for further consideration of the matter.

Since, however, Russia used its veto power to prevent adoption of the British resolution, the Council reached a deadlock. Thereupon Britain submitted a second draft resolution, April 3, which was subsequently adopted by a vote of eight in favor and two abstentions (Poland and Russia). This resolution provided that Britain and Albania should immediately refer their dispute to the International Court of Justice. The Court subsequently accepted the case, the first since the Court's establishment. Written proceedings were submitted to the Court during 1947, and oral proceedings were scheduled to begin early in 1948.

EGYPT

A dispute between Egypt and Britain came before the Security Council, July 11, when the Egyptian Premier protested against the presence of British troops on Egyptian soil and the British administration of the southern portion of the Nile valley known as the Sudan. The treaty of 1936, permitting Britain to maintain forces in Egypt and the Sudan, he declared, had been forced upon the government in Cairo against its will and under extraordinary wartime circumstances which were no longer in existence. Moreover, he contended, the presence of foreign troops within the territory of a member of the UN, in time of peace and without its free consent, was an infringement of the fundamental principle of sovereign equality on which the UN Charter was founded.

In reply to the Egyptian argument, Britain declared that the treaty, which had nine more years to run, was entirely valid and could not be regarded as having been signed merely as a temporary expedient. Such an interpretation, the British delegate asserted, might cause doubts upon Egypt's willingness to carry out other international obligations in good faith.

During the Security Council's discussions of the Egyptian problem, three recommendations were made to the effect that Britain and Egypt should resume direct negotiations with a view to settling their differences. Since, however, none of these proposals received sufficient support for adoption, and no further suggestions on the subject were made when the third vote was taken, on September 10, the Council was unable to proceed further. At the close of 1947 the Egyptian case thus remained an unsettled item on the agenda of the Security Council.

FREE TERRITORY OF TRIESTE

Following a discussion of the articles and annexes of the Italian peace treaty providing that the Security Council should ensure the independence and integrity of the Free Territory of Trieste, the Council formally accepted its responsibilities in this connection. Among the responsibilities thus assumed was that of appointing the Governor of the Free Territory of Trieste, following consultation with the governments of Yugoslavia and Italy. To this end, the five permanent members of the Security Council held a number of informal conversations but were unable to reach agreement. After a delay of several months, Britain requested the Secretary-General, June 13, to fix an early date for the discussion by the entire Security Council of the question of the appointment of a Governor. The Council discussed the matter on several occasions, but was unable to agree on a candidate. In an effort to break this deadlock, the Security Council decided, Dec. 18, to instruct Italy and Yugoslavia to continue the search for a Governor of Trieste.

ATOMIC CONTROL, DISARMAMENT, AND UN ARMED FORCES

Although there was general agreement among the members of the UN on the importance of securing arrangements for the control of atomic energy and limitation of armaments, the dissension among the great powers on these problems prevented substantial achievement in both fields. Throughout the year the Atomic Energy Commission, appointed by and responsible to the Security Council, studied and discussed arrangements for the control of atomic energy. Since, however, the Committee's proposals outlining the principles of an atomic control system were opposed by Russia, they failed of adoption. In view of the tension prevailing between Moscow and Washington it appeared that it was, for the time being at least, impossible to take further steps toward the control of atomic energy.

In connection with the question of non-atomic disarmament, the Security Council established the Commission for Conventional Armaments. The Working Committee of this body discussed the general principles of regulation and reduction of armaments and armed forces, but was unable to reach an agreement.

On the related problem of implementing the Charter's provisions that armed forces and facilities should be placed at the disposal of the Security Council by the member states, there was also little progress. After studying the general principles governing the organization of the armed forces to be thus made available, the Military Staff Committee reported to the Council, April 30, that it had been able to reach agreement on only 25 of the 41 articles concerned. Nevertheless, the Committee proceeded to consider preliminary estimates of the over-all strength and composition of the UN armed forces.

NEW UN MEMBERS AND TOTAL MEMBERSHIP

The Security Council, after considering various petitions for UN membership submitted during the year, agreed to recommend only two of the applicants. These successful candidates were Pakistan, the new Dominion in India, and the Arab Kingdom of Yemen, both were admitted to membership Sept. 30.

In the cases of the 11 other states still waiting for admission—Albania, Austria, Bulgaria, Finland, Hungary, Italy, Ireland, the Mongolian People's Republic, Portugal, Rumania, and Trans-Jordan—the Security Council made no recommendations to the

General Assembly. The Assembly, in an effort to gain membership for six of these states—Austria, Finland, Ireland, Italy, Portugal, and Trans-Jordan—went on record during its regular session as declaring them to be peace-loving and, in the case of the last five, able and willing to carry out the obligations of the Charter. In addition, the Assembly asked the Council to reconsider these applications, particularly in view of the fact that the Council had failed to make a recommendation only because of the opposition of one permanent member, the Soviet Union. In response to the Assembly's request the Council reconsidered the applications of two of the states concerned—Italy and Trans-Jordan—but failed to change its position because of Russian opposition. The Assembly thereupon asked the International Court of Justice for an advisory opinion on the question of whether a permanent member of the Security Council could make its consent to the admission of an applicant dependent on conditions not provided for in Article 4 of the Charter, or declare that it would agree to admit one state on condition that other states also be taken in.

GENERAL ASSEMBLY—PALESTINE

Probably the most important political decision made by the UN during 1947 was the agreement, reached Nov. 29, to partition Palestine. Following repeated failures to find a solution to the Palestine problem acceptable to both Arabs and Jews, Britain, which had held the League of Nations mandate in Palestine for the past 25 years decided early in 1947 to place the question before the General Assembly. In order to take action as promptly as possible the Assembly convoked its first special session, April 27, and established a Special Committee on Palestine which was instructed to make recommendations concerning the future government of Palestine. This 11-member body (composed of representatives of Australia, Canada, Czechoslovakia, Guatemala, The Netherlands, Peru, Sweden, Uruguay, India, Iran and Yugoslavia) visited Palestine during the summer and also inspected displaced persons camps in Europe, and completed its report Aug. 31.

The majority report, approved 7 to 3 (Australia abstained), provided for the partition of Palestine into two independent states, one Arab and the other Jewish, and the establishment of an international administration over the city of Jerusalem. The report further proposed that the two independent states should be bound together by an economic union with a common currency, a customs union, pooling of customs revenues, etc. Partition, it suggested, should not take effect until Sept. 1, 1949, and in the meantime Britain should continue to administer the mandate. This latter recommendation was made despite the fact that the British had already indicated that they would terminate the mandate much before that date and would not assist in carrying out a UN decision unless it was acceptable to both Jews and Arabs.

A minority of the Assembly's Special Committee (India, Iran, and Yugoslavia) proposed a federal Palestine. The federal plan provided for the creation of a federal legislature, but with separate Arab and Jewish states, each having control over local affairs, with the important exception of immigration. Control over immigration into the Jewish state was to be placed in the hands of an international commission composed of three representatives each of the Palestinian Arabs, Palestinian Jews, and the UN. Jerusalem was to be the capital of the federal state, and a UN agency was to guarantee the inviolability of the Holy Places.

Despite the disagreement within the Special Committee, all 11 members agreed that the British mandate should be terminated and independence granted to Palestine "at the earliest practical date," and that the General Assembly should take steps to deal with the problem of Jewish refugees in Europe. Accordingly, the Assembly gave particular attention to Palestine at its regular annual session during the autumn, and made repeated efforts to develop a proposal acceptable to Jews and Arabs alike. However, all of these attempts failed, and the Assembly finally voted on the partition plan Nov. 29 and adopted it by a bare two-thirds majority. The vote was 33 to 13 with abstentions and one absence.

According to the partition plan as adopted by the Assembly, Palestine is to be divided into independent states not later than Oct. 1, 1948. The Arab state of 4,500 square miles will include the coastal regions of Acre in the north and Gaza in the south, part of western Negeb, most of Samaria, and an enclave in the Jewish state containing the port city of Jaffa. The Jewish state of 5,500 square miles will comprise the central coastal plain, including Haifa and Tel Aviv, the eastern part of upper Galilee and most of the Negeb region. Jerusalem and its environs will become an international zone with a special régime under the United Nations Trusteeship Council. Territorially, Palestine will thus be split into three sections connected with each other by narrow corridors.

According to the Jewish Agency for Palestine, the population of the three projected areas of Palestine will be as follows:

	Arabs	Jews
Arab State	804,000	10,000
Jewish State	397,000	538,000
Jerusalem Enclave	150,000	100,000

Figures on population supplied by the British government are, however, considerably different:

	Arabs	Jews
Arab State	847,000	10,000
Jewish State	405,000	498,000
Jerusalem Enclave	105,000	100,000

The two states are to agree to a customs union; a joint currency system providing for a single foreign exchange rate; the non-discriminatory operation of systems of communication involved in international trade and commerce; joint economic development, especially with respect to irrigation, land reclamation, and soil conservation; and access for both states and Jerusalem on a non-discriminatory basis to water and power facilities.

As far as implementation was concerned, Britain maintained that it would have no part, or at least no major part, in implementing the partition scheme. Since neither the United States nor any other nation volunteered to assume any special responsibility, the problem of carrying out the plan thus became uppermost. The problem was further complicated by the fact that the decisions of the Assembly constitute mere recommendations to member states. A Canadian formula was finally adopted whereby the Assembly would name a commission to carry out partition, but the commission would be responsible to the Security Council. This arrangement, however, still did not furnish in advance any outside military force in the event of armed opposition to the Assembly's plan. The five-nation Palestine Commission (Bolivia, Czechoslovakia, Denmark, Panama, and the Philippines) was thus obliged to rely on Jewish and Arab militia and its own moral prestige.

Failure to provide any outside military force to enforce partition appeared particularly serious in view of the Arab reaction to the plan. When the final vote was taken in the Assembly, the six Arab delegations walked out of the meeting and served notice that they would not cooperate in the partition scheme. One reason the Assembly failed to provide for this contingency by setting up a strong enforcement agency was the belief on the part of many delegates until the very end that Britain would modify its hands-off attitude. Another was the fact that the United States was unwilling to furnish American troops, partly at least because of its fear that, in doing so, it might offer Russia an opportunity to send Red Army forces to Palestine.

BALKAN COMMITTEE

The General Assembly made another major decision affecting international peace and security when it decided, Oct. 21, to establish a Special Balkan Commission to maintain a watch on Greece's northern borders. This decision, which rested upon a vote of 40 to 6 with 11 abstentions, was taken only after lengthy and bitter debate in the course of which Russia maintained that the Greek government was solely responsible for the civil war in Greece. The majority of the Assembly, on the other hand, regarded as valid the report of the Security Council's Balkan Commission (see The Greek Issue) and called on Albania, Bulgaria, and Yugoslavia to refrain from furnishing aid and assistance to the Greek guerrillas. The Assembly recommended that the four Balkan governments cooperate with the new Special Balkan Committee in carrying out this request, and it empowered the Committee to recommend a special session of the General Assembly if it considered this step necessary.

The Special Balkan Commission, which has its headquarters in Salonika, consists of representatives of Australia, Brazil, China, France, Mexico, The Netherlands, Pakistan, the United Kingdom, and the United States. Places on the Committee have also been held open for Poland and the U.S.S.R., but both these states have declared that they will not take part. Even more serious than the Soviet boycott from the point of view of the Committee's effectiveness has been the refusal of Albania, Bulgaria, and Yugoslavia to permit this UN organization to make on-the-spot investigations of incidents on the northern side of the Greek frontier. Under these conditions the Committee has been seriously hampered in its efforts to report on the numerous armed clashes which have occurred near the Greek frontier.

KOREA

In an effort to break the Soviet-American deadlock, which prevented the restoration of unity and independence to Korea, the United States requested the General Assembly to take action on this problem. The resolution adopted by the Assembly, Nov. 14 (43 to 0 with 6 abstentions), provided that elected representatives of the Korean people should be invited to take part in consideration of ways and means of reestablishing and maintaining their country's independence. In order to make certain that these representatives were fairly elected and not merely appointees of the Soviet or American military authorities, the Assembly recommended that elections should be held not later than March 31, 1948, on the basis of adult suffrage and by secret ballot, and under the observation of a United Nations Temporary Commission on Korea. This body, which would have powers to travel, observe, and consult throughout the country, was to consist of representatives of Australia, Canada, China, El Salvador, France, India, the Philippines, Syria, and the Ukrainian S.S.R. (The Ukrainian S.S.R. announced that it would not take its place.)

According to the Assembly's recommendation, the representatives chosen in the scheduled election should then constitute a National Assembly, which would convene as soon as possible after the election and form a National Government of Korea. This National Government, the Assembly further provided, should, in consultation with the Commission, take over the functions of government in both North and South Korea and arrange with the Soviet Union and the United States for the complete withdrawal of their armed forces as early as practicable and if possible within 90 days. From the outset, however, the Commission on Korea had few prospects for success since Russia made it clear that it would not permit this body to enter northern Korea.

THE LITTLE ASSEMBLY

One of the most important and bitterly contested actions of the Assembly was its decision to establish the Interim Committee of the General Assembly, or the "Little Assembly." This proposal, which was adopted Nov. 13 by a vote of 41 to 6, with 6 abstentions, provides that a special subsidiary body shall aid the Assembly in carrying out its responsibilities for international peace and security by considering all matters referred to it by the Assembly during the period prior to the Assembly's next regular session in the autumn of 1948. The Committee, whose major decisions must be made by a two-thirds majority of those members present and voting, is to report only to the Assembly and is not to consider any matter before the Security Council.

The establishment of the Little Assembly was strongly urged by Secretary of State Marshall in his opening address to the General Assembly. Russia, on the other hand, together with the five countries of eastern Europe and the Balkans which have consistently voted on its side—Poland, Czechoslovakia, Yugoslavia, Byelorussia, and the Ukraine—strongly opposed the suggestion. Following the adoption of the proposal, Russia and its supporters declared that they would boycott the newly created organ and would resist voting UN funds for its maintenance.

In proposing the creation of the Interim Committee, the American delegation advanced two main arguments. First, it contended that the Committee, meeting in intervals between sessions, would enable the General Assembly to discharge more effectively than formerly the functions with respect to maintenance of peace entrusted to it under the Charter. Second, it believed that by dealing in the interim with such political and security problems as might be brought before it, the Committee would enable the Assembly, at its necessarily short annual sessions, to devote more attention to other matters within its scope, notably economic and social problems and the work of the specialized agencies of the UN, which have heretofore been neglected because of the urgency of political discussions. The United States strongly denied the Soviet contention that the Little Assembly was intended to by-pass the Security Council, although the American and other delegations at the UN admitted regret that the excessive use of the veto by Russia had deadlocked the work of the Council and thus made it more desirable than ever to strengthen the Assembly.

THE VETO

The "veto" or rule whereby a dissenting vote by one of the five permanent members of the Security Council can block action on a substantive question, continued to be a controversial topic, and the Assembly vainly attempted to secure action on its previous recommendations on this matter. During 1946, the Assembly had requested the five permanent members of the Council to make every effort to ensure that the use of their special voting privilege would not impede the Council in reaching decisions promptly. The Assembly had further urged the early adoption of practices and procedures to reduce the voting difficulties and to ensure prompt and effective exercise by the Council of its functions. Since, however, the Security Council had merely referred the problem of the veto to its Committee of Experts for consideration and suggestions, the 1947 session of the Assembly reconsidered the entire question. On this occasion, Argentina presented a proposal to the effect that a General Conference should be called in order to amend the UN Charter by abolishing the veto. China, approaching the problem from a different angle, suggested limiting the use of the veto by the less drastic method of revising existing procedure in the Council.

The outcome of the Assembly's discussion of the veto was the adoption, Nov. 21, by a strongly contested vote, of a United States proposal whereby the Assembly made three requests to the Little Assembly. First, it asked the interim body to consider the problem of voting in the Security Council and to consider the Argentine and Chinese proposals in this connection. Second, the Assembly requested the Committee to consult with any representatives which the Security Council might designate to cooperate with it in the study of the problem. Finally, it asked the Committee to report its conclusions to the 1948 regular session of the Assembly. The Assembly further requested the Big Five to consult with each other for the purpose of reaching agreement on measures which would prevent the veto from blocking action by the Security Council.

WAR PROPAGANDA

The only measure proposed by Russia during the regular session of the General Assembly was a resolution denouncing "warmongering." In its original form, as proposed by Deputy Foreign Minister Vishinsky, this resolution was made with specific reference to the United States, Greece, and Turkey. In a vituperative speech, Sept. 17, the Soviet delegate charged that the United States, England, Turkey, and Greece were guilty of warmongering attacks on the Soviet Union.

Despite the vigorous opposition of the United States, which declared that the Russian resolution should not even be considered, the General Assembly decided to study the proposal. Instead, however, of adopting the Soviet suggestion in its original form, the Assembly accepted, Nov. 3, a resolution which was greatly softened by a compromise draft worked out by Australia, France, and Canada. This draft omitted any references to specific nations, appealed to all governments to abstain from war propaganda and to promote friendly relations among all nations.

TRUSTEESHIP SYSTEM

At the close of 1947, ten territories had been placed under the International Trusteeship System. Eight of these Trusteeship Agreements were approved by the General Assembly, Dec. 13, 1946, thus making the Trusteeship System an active part of the UN. The Trusteeship Council convened at Lake Success for its first session March 26, 1947. As at present constituted, the members of the Council are Australia, Belgium, France, New Zealand, United Kingdom, China, United States, and Soviet Union.

The first eight Trust Territories, all of which were former mandates, were: New Guinea, administered by Australia; Ruanda-Urundi, administered by Belgium; Togoland and Cameroons, administered by France; Western Samoa, administered by New Zealand; and Tanganyika, Togoland, and Cameroons administered by the United Kingdom. The two Trust Territories placed under the Trusteeship System in 1947 were the Pacific Islands, administered by the United States, and Nauru, administered by Australia, New Zealand, and the United Kingdom. Since the Pacific Islands, which were formerly held by Japan under a mandate and occupied by the United States in the Second World War, included strategic areas, they were placed under an agreement which required the approval of the Security Council. This agreement was given April 2. Nauru, which did not come under the special provisions for strategic trust territories, was placed under a Trusteeship Agreement submitted to the Assembly. The Assembly took favorable action on this agreement Nov. 1.

On the same day that the Assembly took action on Nauru, the Assembly urged the Union of South Africa to submit a Trusteeship Agreement for the mandated territory of South West Africa. This marked the second time within a year that the Assembly recommended that South West Africa be placed under international supervision instead of being incorporated into the Union. By the close of 1947, however, South Africa had not complied with this request.

One petition submitted to the Trusteeship Council was from the Ewes, an African tribe of approximately 1,000,000 population living along the coast just north of the equator and on the south side of the bulge which constitutes West Africa. In their petition, the Ewes asked for the early unification of their people, some of whom are in British Togoland, some in French Togoland, and still others in the Gold Coast, a British colony. After consideration, the Trusteeship Council decided not to recommend unification at the present time. However, it promised to reconsider the problem of the two Togolands after it has had a chance to see how the joint measures proposed by Britain and France to diminish present difficulties work out in practice.

SPECIALIZED AGENCIES OF THE UN

While popular attention was centered on the political disagreements in the Security Council and General Assembly, the UN "specialized agencies"—autonomous inter-governmental organizations concerned with social and economic problems—continued to push forward in their particular fields of work.

WORLD HEALTH ORGANIZATION

The World Health Organization (WHO) took decisive steps in fighting the serious cholera epidemic which broke out in Egypt during the autumn. A committee of WHO quarantine experts gave advice on quarantine measures and assembled seven tons of anti-cholera vaccine and other medical supplies which were used effectively in halting the spread of the disease. This action marked the first time in medical history that an epidemic which was spreading at the rate of more than 1,000 new cases a day was checked in a period of approximately six weeks.

UNESCO

Among the chief problems faced by the United Nations Educational, Scientific and Cultural Organization during 1947 were those arising from the all-embracing language of its constitution, which permits the scattering of UNESCO activities in many directions. In an effort to define its tasks more precisely, the organization devoted its annual conference at Mexico City (Nov. 6-Dec. 4) to trimming down its program to fit a budget of less than $8,000,000. Nevertheless, the activities sponsored by UNESCO continue to be divided and subdivided among a large number and variety of projects. The six main areas in which UNESCO is working are reconstruction, education, communications, cultural interchange, social sciences, and natural sciences.

INTERNATIONAL REFUGEE ORGANIZATION (IRO)

The International Refugee Organization, which is the most recent arrival among the human welfare agencies of the UN, is now caring for 656,831 of the estimated 1,500,000 displaced persons in Europe. In addition, IRO succeeded during the period from July 1, when it assumed UNRRA's responsibilities for finding new homes for refugees, until Dec. 1, in resettling or repatriating 76,525 persons out of a total of 900,000 to 1,000,000 men, women and children who will ultimately need assistance of this kind. Tentative IRO agreements with some 15 countries are expected to result in the resettlement of 314,000 displaced persons in the next three years. To facilitate this program, IRO operates a fleet of eight ships, which have been steadily carrying refugees to Australia, Canada, and Latin America. Since, however, the receiving countries have laid down stringent physical and occupational requirements for immigrants, resettlement has been highly selective, and the IRO now faces the problem of what to do with those persons who are too old, too young, or physically unfit. In addition, IRO is hampered by serious budgetary problems. In May, a budget of $115,645,000 was adopted to cover operations during the fiscal year 1947-48. This figure represents a considerable cut below the minimum budget prepared by the IRO Secretariat and allows only $18,000,000 for repatriation and resettlement activities.

CIVIL AVIATION ORGANIZATION (ICAO)

The Interim Civil Aviation Organization continued to make progress in the technical field of international rules of the air, ground aids, airworthiness of aircraft, and the licensing of personnel. However, in the broader field concerned with the rights which the commercial aircraft of one nation should receive in the air over another nation, ICAO has been unable to make headway. Despite efforts within ICAO to define commercial rights in a multilateral agreement open to all, nations are continuing to exchange air rights on a bilateral basis and in return for special privileges.

The chief reason for ICAO's failure to secure adoption of a multilateral air agreement has been the disagreement over the question of whether long-distance airlines should be given the right to pick up local traffic along the way. This right is advocated by countries having long-distance airlines, such as Britain and the United States, and is opposed by those with local lines which fear the competition of the long-distance lines. Because of disagreement on this point, the special meeting which ICAO sponsored in Geneva (Nov. 3-27), in a fourth effort to draw up a multilateral agreement on commercial aviation rights, failed.

FOOD AND AGRICULTURE ORGANIZATION (FAO)

FAO, by continuing to collect and publish information on the world food situation, has become the world's foremost information agency on questions of agricultural products, fisheries, and forestry. FAO has not been content, however, merely to gather facts and has used its right to make recommendations on food problems to member nations. In addition, FAO has put its technical knowledge to work by sending out special missions and technical experts when requested. During the spring an FAO mission to Poland made a careful analysis of Polish agriculture and recommended certain changes directed toward halting decline in soil fertility and increasing the supply of dairy cattle. Similar FAO missions will be sent to Siam and Venezuela early in 1948.

Whether FAO will succeed in becoming the focal point of international action concerning agricultural problems is still an open question. Argentina and Russia, two of the world's agricultural countries, have failed to join the organization. Moreover, the proposal by the United States Secretary of Agriculture, Nov. 21, that a separate conference of food-producing nations be called to consider means of improving production and distribution of food throughout the world, suggested that the United States might also prefer to work outside the FAO framework on certain matters of international concern.

INTERNATIONAL BANK

According to the quarterly financial statement of the International Bank for Reconstruction and Development, issued as of Sept. 20, the Bank has made the following loan commitments: France, $250,000,000; The Netherlands, $195,000,000; Denmark, $40,000,000; Luxembourg, $12,000,000—a total of $497,000,000. At that time, the Bank had a balance of $480,000,000 available for new loans. In December, the Bank announced the dispatch of a mission to Chile to study Chile's application for a loan. A Polish request for a loan was turned down by the Bank following Poland's refusal to attend the Paris conference of the 16-nation committee formed to study the Marshall Plan.

The Bank vigorously objected to the proposal by the Harriman Committee (see "United States and Europe") that it furnish a sizable portion of the $3,400,000,000 which it was estimated that the nations cooperating in the European Recovery Program would need during the period 1948-52 for the purchase of industrial capital goods. The Bank pointed out that, of its total capital of $8,000,000,000, only a fifth of this amount is to be actually paid in by the member nations and used for loans, while the remaining unpaid capital is to remain on call in case of defaults on loans. Moreover, the Bank declared, it has many members besides the 16 European nations to be aided by the United States under the ERP, and it could not, therefore, concentrate on aiding these countries without violating the spirit of its charter.

OTHER AGENCIES

The International Labour Organization (ILO) held a series of regional meetings at each of which resolutions dealing with local working conditions were adopted. The Universal Postal Union (UPU) held its first session since the close of the war and resumed normal operations. The International Telecommunications Union (ITU) underwent a reorganization and began preliminary work on the reallocation of wave-length bans for international broadcasts. A preliminary charter for the proposed International Trade Organization (ITO) was completed at a technical conference in Geneva and submitted to a conference of ITO members at Havana. In an effort to bridge international differences in the field of commercial policy, the draft Charter was made an extremely flexible instrument. Nevertheless, at the close of 1947, the Havana conference, which began Nov. 21, had proved unable to reconcile the conflicting interests of the major trading nations of the world.

PLANNING UN HEADQUARTERS

Early in 1947, a Headquarters Planning Office was established to carry forward the plans for a permanent UN headquarters on the site in Manhattan, New York City, which had been acquired as a result of a gift from John D. Rockefeller in 1946. Demolition of existing properties on the site, which is bounded by First Avenue, East 48th Street, East River, and East 42nd Street, was nearly completed by the close of the year. The General Assembly also granted authority to the Secretary-General to negotiate with the United States Government for a $65,000,000 interest-free loan for the construction of the permanent headquarters. President Truman had previously indicated his willingness to ask Congress to grant approval for the loan.

ECONOMIC AND SOCIAL COUNCIL (ECOSOC)

The large number of commissions and sub-commissions established under ECOSOC for the purpose of dealing with economic and social matters continued to work on a wide variety of projects. The Economic Commission for Asia and the Far East began to collect statistical and economic data which might form the basis for projects designed to raise the low standard of living of the countries of Asia. The Economic Commission for Europe studied problems connected with road and rail transport, industry, coal, and manpower, and made a number of recommendations to the European countries concerned. Preparations were also begun for the creation of an Economic Commission for Latin America, whose task would be to study the problems of the under-developed economies of this area.

Work on a proposed International Bill of Rights was begun by the Human Rights Commission in January 1947. The final draft of the bill was accepted by the Commission, Dec. 16, by a vote of 13 to 0, with the U.S.S.R. and three eastern European nations abstaining on the grounds that the declaration did not go far enough in establishing human rights. The draft, following presentation to all members of the UN for comment, will be brought before the 1948 session of the General Assembly. Among the 35 articles included in the draft are provisions for the abolition of slavery and forced labor, the right to a fair trial, freedom of assembly, and freedom of religious opinion, worship, and teaching, the right to asylum from persecution, and the right of any person to be presumed innocent until proved guilty.

THE UNITED STATES AND THE PEACE TREATIES

By Winifred N. Hadsel
Research Associate, Foreign Policy Association

GENERAL

At the beginning of 1947 the Big Four (U. S., Gt. Britain, France, Russia) had just completed peace treaties with Italy, Bulgaria, Rumania, Hungary, and Finland, and these agreements were formally signed at a simple ceremony held at the French Foreign Ministry in Paris Feb. 10. This progress toward peacemaking gave rise to a guarded hope in the United States that American and Russian views on the crucial problem of Germany might be accommodated in the near future. Instead, however, of smoothing the way toward a German settlement, the treaties with the former Axis satellites led only to another round of tense and tedious negotiations. In fact, work on the German and Austrian settlements proceeded even more laboriously than had the discussions leading to the conclusion of the satellite treaties, and the year 1947 closed with East and West deadlocked on all major questions concerning the future of Germany and Austria.

TREATIES WITH AXIS SATELLITES

The first five peace treaties to be concluded after the Second World War were the product of a long period of negotiations which had been begun in London in September 1945 at the first session of the Council of the Big Four Foreign Ministers, the body established by the Potsdam Conference in August 1945 as the principal organ responsible for drafting the peace treaties. Between the close of this parley and the actual signing of the treaties, three additional meetings of the Foreign Ministers, a special session of the representatives of the Big Three, and a peace conference of 21 nations had been required to formulate the terms of the settlements. The chief reason for this slow diplomatic pace had been the succession of sharp clashes between Russia and the Western powers which attended nearly every step of the treaty negotiations. (For the main provisions of the treaties with Italy, Bulgaria, Rumania, Hungary and Finland, see "The United States and the Peace Treaties," The American Year Book, 1946.)

In the United States the treaties with Italy, Bulgaria, Hungary, and Rumania were generally regarded as unsatisfactory in several respects. (Since the United States had not been at war with Finland it did not sign the peace treaty with that country.) One chief source of dissatisfaction was the series of clauses which provided for the payment of reparations to Russia and thus gave the Soviet Union long-term economic controls over the former enemy nations. In the case of Italy, it was also felt that the terms were unduly harsh and imposed such heavy burdens that moderate forces might not be able to retain control of the government. Nevertheless, the prevailing American view was that the treaties constituted the best arrangements which could be obtained at that moment or in the foreseeable future, and they were accepted on this basis.

The two public leaders chiefly responsible for securing general public acceptance of the treaties were former Secretary of State James F. Byrnes, who had represented the United

States in most of the treaty negotiations, and Secretary of State George C. Marshall. During the early months of 1947 these two men strongly urged the Senate to ratify the agreements despite certain admittedly "unsatisfactory features." The advantages of prompt and favorable American action, they argued, would be threefold. First, ratification would pave the way for the withdrawal of occupation troops from Italy and the former satellite states in eastern Europe. Second, the arrangements might "create an element of stability and encourage further progress along the road to peace." Finally, the former enemy states, by becoming eligible for admission to the United Nations, would obtain the right to appeal to the international organization for the settlement of future problems affecting their peace and security.

OPPOSITION TO RATIFICATION

One voice raised against prompt ratification of the treaties was that of Adolf A. Berle, Jr., former Assistant Secretary of State. In a statement issued on Feb. 10, Berle contended that, since the treaty negotiations had revealed a wide gap between the U.S.S.R. and the Western powers, the treaties themselves could not be relied upon to establish a satisfactory basis for peace. He proposed accordingly that the United States defer action, at least in the case of Italy, until Soviet-American relations improved. However, with the exception of Berle and leaders of Italo-American groups, the treaties met with little well-organized opposition, and the debate in the Senate culminated in ratification on June 5. At this time the agreements with Bulgaria, Hungary, and Rumania were accepted by acclamation, and the Italian treaty was ratified by a vote of 79 to 10.

RATIFICATION OF ITALIAN TREATY

Although Senatorial acceptance of the treaties had never been seriously in doubt, the size of the majority favoring the Italian settlement was largely traceable to the efforts which Senator Arthur H. Vandenberg, Republican of Michigan and Chairman of the Foreign Relations Committee, made in behalf of ratification. While admitting that he could not approve all the detailed engagements set forth in the pending Italian treaty, he argued that the United States was in no position to change these provisions unilaterally even if it wished to do so. Moreover, he argued, by delaying action on the treaty the United States would merely perpetuate confusion and uncertainty in Italy and throughout Europe as a whole, thus further delaying the reconstruction which this country wished to encourage. In reply to the contention that ratification should be postponed lest the withdrawal of American forces leave Italy at the mercy of armed subversion at home and penetration by hostile neighbors, the Senator declared that the United Nations should be able to find a way to defend Italian democracy. In a further effort to reassure the Senate, he stated that ratification would not necessarily rule out changes in those treaty provisions which the United States found undesirable. Article XIV of the United Nations Charter, he stated, specifically empowered the General Assembly "to recommend measures for the peaceful adjustment of any situation, regardless of origin, which it deems likely to impair the general welfare or friendly relations among nations."

REVISIONIST MOVEMENT BY THE SATELLITE STATES

Despite these and similar assurances on the part of American leaders the former satellite states received the treaties with varying degrees of dissatisfaction, and four of these nations promptly launched a revisionist movement. Italy was particularly outspoken in its opposition and observed Feb. 10 as a day of national mourning. Rumania, Hungary, and Bulgaria, whose representatives joined Italy in addressing formal notes of protest to the Council of Foreign Ministers, discreetly restricted their objections to those portions of the treaties which did not directly affect Russia. Only Finland, whose government was also known to dislike several portions of its treaty, refrained from registering any formal objections lest in doing so it arouse Russia's suspicions.

Despite dissatisfaction on the part of both the Allies and the former Axis satellite states with certain portions of the peace treaties, all five agreements were ratified and put into effect by September 1947. Since, however, Russia was permitted to maintain an undefined number of troops in Hungary and Rumania until a peace with Austria had been arranged, the withdrawal of troops envisaged by the treaties was not entirely carried out by the end of the year. Moreover, inability of Russia and the Western powers to agree on a governor for Trieste blocked the numerous efforts of the United Nations Security Council to establish the special régime which the Italian treaty proposed for this Free Territory. Meanwhile Trieste and the surrounding territory remained under military occupation, and numerous incidents between British and American forces, on the one hand, and Yugoslav troops, on the other, made the area one of Europe's trouble spots.

ALLIED DISAGREEMENT ON AUSTRIA

As soon as the peace settlements with the five former Axis satellites had been concluded, the Allies moved on toward a consideration of the crucial problem of Germany. Austria, which had been completely absorbed in Hitler's Reich following the Anschluss of 1938, formed one phase of this problem, and in the winter of 1946-47 the United States began to urge persistently that the Big Four appoint deputies to start work on an Austrian treaty. According to the American view a settlement should be arranged with Austria as soon as possible in order to terminate the quadripartite military occupation of the country. The presence of foreign troops, the United States contended, was not only the chief obstacle to the peacetime recovery of Austria, whose economy had been heavily subsidized by British and American aid since the end of the war, but a continuing source of inter-Allied friction.

In response to the suggestion by the United States that work on an Austrian settlement should proceed as rapidly as possible, the deputies of the Foreign Ministers met in London, Jan. 14 to Feb. 25, 1947, to prepare a draft treaty. At these sessions, however, such bitter clashes occurred between the American and Russian delegates over territorial changes, reparations, and the definition of "German assets" that agreement was reached on only a limited number of minor clauses. Moreover, the differences among the deputies proved to be only the prelude to even more acrimonious exchanges among the Foreign Ministers themselves when they met in Moscow (March 10-April 24) and again in London (Nov. 25-Dec. 15). Thus the year ended with Austria still subject to military occupation and with its prospects for a peace treaty in the near future decidedly poor.

Basically, the failure of the Allies to reach agreement on the terms of an Austrian treaty can be traced to the peculiarly significant geographical position of Austria between East and West. Although only approximately the size of North Carolina, with an area of 32,000 square miles and a population of less than 7,000,000, Austria stretches from the edge of the Slavic lands to within 100 miles of the French frontier. This strategic location, which has been an essential element in determining Austria's history for centuries, makes the country a crossroads in post-war Europe which neither the Russians nor the Western powers are willing to see their rivals control.

DEFINITION OF "GERMAN ASSETS"

The more immediate cause of the inter-Allied stalemate was the disagreement between Russia and the West on three points. The Soviet Union demanded that Austria surrender Southern Carinthia and Southern Styria to Yugoslavia, and it supported the Yugoslav demands for $150,000,000 in reparations. The United States opposed both these requests. The third point in the controversy was the definition of "German assets" in Austria. At the Potsdam Conference of 1945 the Big Three had listed "German assets" in Austria as a source of reparations without, however, attempting to define these assets. According to the Russian view, the term referred to all German-owned property in Austria at the end of the war. On the basis of this broad interpretation Soviet occupation authorities proceeded to remove factories, hydro-electric equipment, machine tools, iron and manganese deposits in their zone which had belonged to the Germans, and they laid claim to similar properties in the western zones. Also included in the Russian confiscations were farm and forest lands, Danubian shipping, railroads, and the network of highways which the Nazis had built or were preparing to build when the war ended.

Russia's broad definition of German assets, which apparently reflected the U.S.S.R.'s determination to link Austria's industrial economy with the predominantly agricultural Soviet sphere in eastern Europe, was strongly opposed by the Western powers, and particularly by the United States. According to the American view, the Russians had misinterpreted the Potsdam arrangement on German assets and erroneously included in their definition property which was actually Austrian since many of the so-called Nazi purchases of Austrian holdings had been made by force or duress. Only by investigating the conditions under which the Germans had secured title to specific Austrian properties, the United States contended, could a just settlement of this problem be reached. Furthermore, the United States maintained, if the Soviet definition of German assets were admitted, Austria would be deprived of all hope of independence. Accordingly, Secretary Marshall formally requested the Moscow session of the Council of Foreign Ministers to define German assets, provide for arbitration in the case of disputed ownership, and require the application of Austrian law to properties obtained as *bona fide* German assets. This last request represented an attempt to prevent Russia from exercising extraterritorial rights over the oil fields and other stationary properties it had seized in its zone as reparations.

When the Moscow conference failed to agree on any of the points connected with the question of German assets, Secretary Marshall suggested that the United States might go before the United Nations General Assembly and ask it for its recommendations on this subject. "It is our view," he declared, "that we should not permit differences among us to deny to Austria her independence and her right to be free from the burdens of occupation." Confronted by this American proposal, which threatened to transfer responsibility for peacemaking from the Big Four to the United Nations as a whole, Russia agreed at the final meeting of the Moscow session to establish a four-power Austrian treaty commission which would be instructed to seek means of adjusting the differences concerning German assets. Joseph M. Dodge, Detroit banker and former financial adviser to the American Military Governor in Germany, represented the United States on this commission, which held meetings in Vienna from May 12 to Oct. 11.

AUSTRIAN TREATY COMMISSION

The Austrian treaty commission was paralyzed from the outset because of disagreement between Russia and the Western powers as to its proper function. The American representative insisted that the commission had been created to study the facts involved in specific cases involving alleged German assets. The Russians, on the other hand, declared that the commission should restrict itself to a discussion of a formal definition of German assets. According to the Soviet delegate, M. V. Novikov, Russia considered the determination of concrete facts on German properties in Austria a "political rather than a technical matter" and hence beyond the competence of the commission. Although this particular impasse on procedure was broken during the middle of June, when the Soviet Union agreed to discuss particular German assets, provided the cases chosen for consideration were selected on the basis of unanimous agreements, the commission remained deadlocked because of Russia's refusal to permit discussion of more than a few questions.

Despite the failure of the Austrian treaty commission to find a basis for agreement on the problem of German assets, the United States and Britain continued to hope that a treaty for Austria might be drafted at the London session of the Council of Foreign Ministers. Austrian Prime Minister Karl Renner also called on the Foreign Ministers to find a general solution for Austria "which will free her from imposed international entanglements." Russia, on the other hand, indicated that it was in no hurry to conclude an Austrian treaty. Thus Foreign Minister Molotov rejected a compromise proposal by France which conceded Soviet capital reparations in oil and Danubian shipping and requested Russia and the other allies to specify the monetary value of their other claims to German assets with a view to charging them against Austrian current production over a period of eight to ten years. Since the Western powers felt that they could propose no further concessions on this point, the London conference, like its predecessor in Moscow, failed to reach an agreement on Austria. In American and British diplomatic circles it was believed that Russia wished to delay the Austrian settlement, not only because the Soviet Union needed time to consolidate its economic control over eastern Austria, but because Soviet leaders thought that continued uncertainty in Austria might produce a preponderantly Communist electorate. Moreover, as long as Austria remained under Allied occupation, Russia was permitted by the terms of the Rumanian and Hungarian peace treaties to maintain its lines of communication through these countries, thus strengthening the Soviet position throughout eastern Europe.

DEADLOCK ON GERMAN TREATY

On the problem of Germany the deadlock between Russia and the Western powers was as complete as in the case of Austria, and at the close of 1947 it appeared that further negotiations for a German treaty would be postponed until East and West struck a balance in Europe as a whole. The first full-dress discussion of Germany by the Big Four Council of Foreign Ministers was held at Moscow in March and April. At this conference, as in the case of previous discussions of Germany by the Big Three at Yalta in January-February 1945 and Potsdam in July-August 1945, and by the Foreign Ministers at sessions devoted primarily to the treaties with the Axis satellites, the main issues were reparations, frontiers, and the nature of the political organization of the new German state.

At Moscow the reparations debate centered on the interpretation of decisions which had been reached at the Yalta and Potsdam conferences. According to Foreign Minister Molotov, who publicly revealed the secret decisions of the Yalta meeting for the first time, President Roosevelt had accepted as "a basis for study" the Soviet figure of $20,000,000,000 worth of reparations at 1938 values, of which Russia was to receive half. Moreover, the American President had agreed to direct the Reparations Commission established by the Big Three to consider production from current output as well as capital removals as possible sources of reparations. Although the United States had committed itself at Yalta only to consider the large figure proposed by Russia, and the British delegation had refused to accept the Soviet suggestion even on this basis, the Soviet representatives at Moscow interpreted the Yalta protocol as meaning that the three powers had agreed that Germany should pay $20,000,000,000 in reparations and that this sum should be paid from current production as well as from stocks of capital goods existing at the end of the war. In combating this figure, the American and British delegations argued mainly from the text of the Potsdam agreement, which, they declared, had superseded the tentative plans laid at Yalta. At Potsdam, the Western powers pointed out, the amount of German reparations had not been definitely set but had been made contingent upon the establishment of an economically united and self-sufficient German economy. Moreover, the Western powers contended, although the Potsdam arrangements had not explicitly restricted reparations to capital removals, the agreement that Germany should retain productive capacity sufficient only to assure a minimum standard of living implied that Germany should not pay reparations out of current output.

CONFLICT OVER REPARATIONS

Underlying the Russian interpretation of the reparations agreements previously reached by the Big Three at Yalta and Potsdam was the Soviet determination to make Germany pay as much as possible toward the reconstruction of the U.S.S.R. At first the Russians had apparently believed that they could achieve this goal by moving entire German factories and other capital goods to the Soviet Union. During the months immediately following the close of the war the Russian authorities concentrated on wholesale removals of German equipment to Russia and favored the reestablishment of a relatively low level of industry in Germany. By mid-1946, however, the Soviet Union began to find this approach to the reparations problem unsatisfactory, for they encountered endless difficulties in reestablishing German plants and were able to achieve only a fraction of the productivity they had anticipated. Under these conditions Russia came to consider large-scale reparations from current output as an essential supplement to reparations from capital output. At the Moscow conference, therefore, Russia implied that it was prepared to support measures leading to the economic unification of Germany, as the United States and Britain had urged since Potsdam, provided the Western powers would accept its views on reparations. Another factor responsible for the Russian decision to support economic unification under certain conditions was the apparent Soviet belief that economic unity would lead to the political unity which the Soviet Union supported in an apparent effort to win German favor.

The chief economic objective of the United States and Britain in Germany continued to be the reestablishment of German self-sufficiency. Both of the Western powers found themselves in the paradoxical position of paying what amounted to reparations in reverse, for during 1947 the occupation of Germany cost the United States and Britain $350,000,000 each, in addition to the maintenance of their own military forces. Under these conditions the Western powers opposed the Russian demands for reparations on the grounds that these requests would make it necessary for the West to continue to subsidize Germany over a long period. For no matter how high the level of German industry might be placed in theory, American and British representatives maintained there were definite practical limits to the production which Germany would be able to achieve for several years to come. Moreover, even if Germany were able to produce in excess of its own basic needs, the United States and Britain wished to see the Germans send a sizable amount of this surplus to Western European countries.

Faced with this impasse on the problem of reparations the United

States delegation offered a limited concession at Moscow. To understand the nature of this proposal and the economic issues involved in it, it is necessary to refer to the level-of-industry plan of March 1946 whereby the United States determined the output and industrial capacity to be permitted in its zone of Germany under the provisions of the Potsdam arrangements. This plan had been based on the assumptions that the German population would prove no larger than the estimate made in March 1946 and that the German frontiers would be those suggested at Potsdam. By the time of the Moscow conference, however, it was clear that the German population was, in fact, some 4,000,000 larger than the estimate. The United States and Britain had also agreed to the detachment of the Saar territory in favor of France. Hence the German population was larger and the German territory smaller than originally postulated, and it was evident that a reconsideration of Germany's permitted industrial level was in order. By the time of the Moscow conference, moreover, American officials had become convinced that Germany should make a contribution to economic recovery in Europe and that this would be possible only if the Germans were allowed to produce at a rate substantially above that which had been envisioned in the spring of 1946.

Since the upward revision of the German industrial level as proposed by the United States would clearly reduce the plant and capital equipment available for reparations, the American delegation at Moscow proposed to compensate prospective reparations recipients by commuting the value of capital equipment which would otherwise be removed as reparations into reparations from current output. Thus the United States, while refusing to accept the Soviet figure of $20,000,000,000 worth of reparations, was willing to permit the collection of an unspecified quantity of reparations from the current production of a united Germany, provided certain requirements were met. In essence, these requirements called for the postponement of reparations from current production until Germany achieved economic self-sufficiency at a subsistence level.

To the Soviet Union the American proposal for a reparations settlement was regarded as completely unacceptable, and the Russian delegation reiterated its Yalta claims and in effect repudiated the reparations program which had been worked out by the Big Three at Potsdam. The Moscow session of the Foreign Ministers ended, therefore, with the participants even further apart on the question of reparations than they had been before. Moreover, even if agreement had been reached on reparations, there were indications that the Allies would not have been able to work out a political solution in Germany. For example, important differences arose in Moscow concerning the composition of a provisional German government and its powers. In general, the Soviet delegation argued that central German governing bodies should be composed not only of duly elected representatives but should include "representatives of free trade unions and other anti-Nazi organizations." The Western powers, which assumed that "anti-Nazi" would be interpreted as meaning pro-Communist, rejected the Soviet formula.

FORM OF GERMAN GOVERNMENT IN QUESTION

While the United States, Britain, and France favored a central German government of limited powers with residual powers belonging to the *Länder*, the Soviet delegation argued for more power for the central government and attempted to win favor in Germany by defending the rights of Germans to determine such questions for themselves. A comparable question arose in connection with the structure of trade unions. The French wanted to limit unions to the area of the *Länder*. The United States and Britain favored national unions, but the United States, in particular, fearing Communist domination of a centralized trade union movement, favored the financial and organizational autonomy of the individual unions. The Soviet Union again took the position, popular in Germany, that this was a matter for the Germans themselves to work out.

DISAGREEMENT ON FRONTIERS

On the problem of the final delimination of the Polish-German boundary the Moscow conference revealed another sharp difference between Russia and the Western Allies. According to the Soviet Union, the approximately 40,000 square miles of eastern German territory which the Potsdam conferees placed under Polish administration had already been awarded to Poland. The United States, on the other hand, argued that the Polish-German frontier had not been settled. The Potsdam protocol, the American delegation pointed out, provided only that "the final delimination of the western frontier of Poland should await the peace settlement." According to the United States, this settlement, while compensating Poland for Polish territory acquired by the Soviet Union east of the Curzon Line, should not create a popular issue for militant nationalist movements in Germany and rule out all hope that in future years Polish-German relations might become peaceful and cooperative. The United States proposed, therefore, that, while southern East Prussia and German Upper Silesia and its industrial complex should become Polish, the remaining territory, consisting largely of agricultural lands, should be divided on the basis of a consideration of the needs of the Polish and German peoples and of Europe as a whole.

The failure of the Moscow conference convinced the United States that the settlement of the German problem might be long delayed and that in the meantime it was necessary to increase production in western Germany with a view to aiding the recovery of Europe and to reducing the cost of the German occupation to the American taxpayer. Accordingly, the Marshall Plan was announced six weeks after the Moscow conference (see "The United States and Europe"), and the United States took the lead in revising the level of industry permitted in the combined British and American zones of western Germany.

WESTERN ECONOMIC POLICY IN GERMANY

An important step in the development of a new economic policy toward Germany had, in fact, already been taken by President Truman at the end of January, when he appointed former President Herbert Hoover to review conditions in the American zone. In a report dated March 18, Hoover declared that present American economic policy, as set forth in the directive issued by General Eisenhower in April 1945 (JCS 1067) and the Potsdam Declaration of 1945, reflected the influence of the Morgenthau "deindustrialization" plan. This plan, he continued, could only prevent economic recovery in both Germany and Europe and increase the heavy financial burdens of the United States. The only way to make Germany self-supporting and an asset to European recovery, he concluded, was by restoring German heavy and light industries to full production.

Following the failure of the Moscow conference to make any progress toward a German peace treaty, the United States and Britain began to re-examine the American level of industry plan of 1946 with a view to making their combined zone more productive. According to the decisions which had been reached in March 1946 the industrial capacity retained by Germany was estimated to provide production equal to 55 per cent of 1938, or about 70-75 per cent of 1936. Under the new plan, formally announced by the British and American Military Governments on Aug. 29, sufficient industrial capacity should be retained in the Anglo-American zones to approximate the level of industry prevailing in Germany in 1936, a year characterized neither by boom nor depressed conditions. In steel production, the permitted level was raised from the 7,500,000 tons figure of March 1946, with actual production in any single year restricted to 5,800,000 tons, to 10,700,000 ingot tons. Comparable increases were also permitted in the manufacture of machinery, machine tools, automobiles, electrical equipment, and chemicals.

Realizing that the sharp increase in the permitted level of German industry might alarm the French, the United States and Britain invited France to attend discussions in London (Aug. 22-27) of their new plan. At these meetings the American and British representatives attempted to reassure France that their proposed measures for rehabilitating Germany would not be taken at the expense of the recovery and security of the democratic countries of Europe. These assurances were only partially successful, however, and French spokesmen made no secret of their disappointment over the outcome of the London talks. Among the several phases of the Anglo-American blueprint for German industry which France found particularly unsatisfactory was the proposed increase in machine tool manufacturing potential to a level greatly out of proportion to that possessed by France.

EUROPEAN RECOVERY PROGRAM LINKED TO GERMAN SETTLEMENT

The efforts of the United States to revise its policy toward Germany in the light of Europe's economic needs were continued at the London meeting of the Council of Foreign Ministers. Whereas the main objective of the United States in previous discussions on Germany had been the prompt unification of Germany, the chief goal of the new American approach as revealed at London was that of making Germany contribute to the rehabilitation of the Marshall Plan countries. For this reason, Secretary Marshall, while still hoping for German unity, refused to pay a price for it which in his opinion would jeopardize implementation of the European Recovery Program. Heading the list of the Soviet conditions which the United States rejected were the demand for $10,000,000 worth of reparations, the cession to Poland of all eastern German territory under Polish administration since the end of the war, and the establishment of a German régime prior to the negotiation of a peace treaty. Since the positions of Russia and the Western powers on all of these three points remained almost exactly the same as they had been at the Moscow meeting seven months before, the London session produced no agreement.

In a broadcast to the American public on Dec. 19, Secretary Marshall declared that further efforts toward peace would have to await implementation of the European Recovery Program. During the war, he declared, there had been created in Europe a political vacuum which had not yet been filled. Until this vacuum was filled by the restoration of a healthy European community, he reasoned, agreements on paper would not necessarily mean much. "Agreements between sovereign states," he stated, "are generally the reflection, and not the cause, of genuine settlements." At the close of 1947 the United States thus pinned its hopes for the conclusion of a German settlement which, in the phrase of Secretary Byrnes at Stuttgart in 1946, would make Germany "neither a pawn nor a partner," on the stabilization of Western Europe rather than on additional diplomatic negotiations by the Big Four Foreign Ministers.

THE UNITED STATES AND EUROPE

U. S. EUROPEAN RECOVERY PROGRAM

The most important development in the United States foreign policy toward Europe during 1947 was the announcement of the American-sponsored European Recovery Program. This program embodied the decision of the United States to assume important responsibilities for the long-range economic reconstruction of the European continent with the view to filling the political vacuum created by the Second World War with a group of nations capable of protecting their independence against communist attacks at home or Russian pressure from abroad.

Several factors were responsible for this historic American decision. First, there was the obvious inability of Europe to recover from wartime destruction and disruption unless it received aid from more fortunate parts of the world. At the close of 1946, it had appeared that a number of European countries, including some of those which had suffered most seriously during the war, were safely on their way to industrial recovery. Although Germany, formerly the most highly industrialized nation on the continent, was at that time still below the half-way mark of its pre-war rate of industrial production, Italy had climbed to 70 per cent of its 1938 level; France, Belgium, and The Netherlands were within 80 to 90 per cent of this mark; and Great Britain and the Scandinavian nations were back at their pre-war levels or well above them. In achieving this degree of recovery, Europe had been greatly aided by the more than $4,000,000,000 in grants and $8,000,000,000 in loans and credits which the United States had extended to the nations of Europe since V-E Day for relief and rehabilitation. Convinced that this aid had been sufficient for the major tasks of post-war relief, Congress pressed for the abolition of UNRRA, the major international relief organ, on June 30, and passed an appropriation for $332,000,000 worth of post-UNRRA assistance to Greece, Italy, Austria, and Trieste (May 31).

In the meantime, Europe experienced the severe winter of 1946-47. Winter crops in almost all of the Western European countries were ruined by the severe freeze and spring floods that followed. Coal and other raw materials could not be mined in adequate amounts, and transportation was frequently slowed down or stopped altogether. Factories were forced to close either because people could not get to work or because motive power and raw materials were lacking. Thus the State Department in Washington began early in 1947 to receive information which indicated that the gains which Europe had already made toward recovery might yet be lost unless some way could be found to assist the European peoples in the months ahead. Under these conditions the United States Government re-appraised the entire problem of European recovery and concluded that the situation in Western Europe had entered a new phase and demanded a new approach.

The need for American aid to Europe appeared all the more urgent because of Britain's declining economic and military strength. At the close of the winter of 1946-47 the British found themselves in the throes of such a severe financial and economic crisis that they were obliged to liquidate a number of their overseas commitments. In doing so, they suddenly created power vacuums in a number of areas, notably in Greece and Turkey. Since Russia's influence continued to grow while Britain's power waned, it appeared to the United States that areas formerly within the British sphere of influence might fall under Soviet control if the United States failed to use its economic strength to prevent this development.

TRUMAN DOCTRINE AND AID TO GREECE AND TURKEY

The first avowed effort of the United States to contain Russia and prevent her from supplanting Britain in a particular area of Europe was made in the case of Greece and Turkey. In a special message to Congress on March 12, 1947, President Truman explained that Britain had announced on Feb. 24 that it would be unable to continue financial assistance to Greece after March 31, the end of the British fiscal year. Moreover, he continued, the British had declared that they would be obliged to reduce their military strength in Greece in the near future. Lest this virtual withdrawal by Britain from the eastern Mediterranean result in a Communist coup in Greece, where pre-war poverty was compounded by appalling wartime destruction, and an armed minority enjoyed the support of the pro-Soviet governments of Albania, Yugoslavia and Bulgaria, the President urged emergency American aid to the Greek government. Enunciating the broad principle which the press promptly christened the "Truman Doctrine," the President declared that "Totalitarian regimes imposed on free peoples undermine the foundations of international peace and hence the security of the United States."

To prevent a Communist coup in Greece, Mr. Truman proposed that Congress immediately appropriate $300,000,000 worth of aid to Greece. Half of this sum, according to original plans, was to be spent on strengthening the Greek army against Communist-led guerrillas, and half of it on the reconstruction of the civilian economy with a view to bolstering the non-Communist elements. In the case of Turkey, the President urged that $100,000,000 worth of exclusively military aid be extended to the authorities in Ankara in order to strengthen them against "outside pressure." This pressure, administration spokesmen subsequently explained, was being exerted by Russia for the purpose of securing special rights in the Dardanelles and acquiring certain territories in eastern Turkey.

After a debate which lasted until April 22 in the Senate and May 9 in the House of Representatives, the two houses of Congress passed the Greek-Turkish aid bill by votes of 67 to 23 and 287 to 107 respectively. Passage of the bill marked an important development in American foreign policy in that it constituted a frank acknowledgment that the United States opposed Russian expansion, whether conducted by the Kremlin itself or by local Communist parties. The Truman Doctrine as expressed in aid to Greece and Turkey was, however, an essentially negative policy designed to contain Russia in a strategic area. The more positive policy of strengthening the democratic forces of Europe in order to halt Soviet expansion was developed only at a later date.

ADMINISTRATION OF GREEK AID

In an effort to make the Greek aid program more effective than previous post-war foreign assistance of approximately $800,000,000 to the government in Athens had been, the United States bluntly insisted upon close supervision of its aid. In addition, Washington secured from the Greek government a promise to undertake a series of economic and social reforms and to consult American advisers before making any decisions concerning economic affairs which might affect the aid program. Among the major changes which the Greek authorities undertook to bring about in their notoriously inefficient and disrupted régime, were a revision of the taxation system, the adoption of stronger anti-inflationary measures, the conservation of foreign exchange, and the improvement of the civil service.

The American Mission for Aid to Greece, which was set up to administer the special assistance from the United States and to help Greece put its economic house in order, was headed by Dwight P. Griswold, former Republican Governor of Nebraska. The first contingent of the 100-member military section of this Mission was dispatched to Greece by May 23 to begin study of the requirements of the Greek army. Simultaneously the engineers, accountants, and other technicians needed in connection with the plans for civilian reconstruction were selected, and Griswold arrived in Athens on July 14 with the first group of civilian experts. The first installment of $35,000,000 worth of arms, ammunition, planes, and trucks, as well as food and clothing for the Greek army, arrived at the port of Piraeus Aug. 1. Despite the steady arrival of supplies after this date, however, the work of the Mission was seriously hampered both by events in Greece and along its northern frontiers.

Within Greece itself the Rightist régime led by the Populist Party stimulated civil strife by labeling any critics of government policies as "Communists" and by continuing corrupt administrative practices. Confronted with this situation, the Griswold Mission insisted on a reorganization of the government, and on Sept. 7 a coalition cabinet headed by the aged but widely respected Liberal, Themistocles Sophoulis, was formed. This cabinet, by offering a liberal political amnesty and by attacking the excessively high cost of living, attempted to attract all but confirmed Communists away from the guerrillas. However, the Sophoulis cabinet could not eradicate the inefficiency and corruption of the government overnight, particularly since it was obliged to cope with foreign-supported guerrillas. Despite both political and military efforts of the Greek government to stamp out the guerrillas, the Communist-led movement felt itself strong enough to announce Dec. 23 the formation of a "Free Government" in the guerrilla stronghold along Greece's northern frontier.

Efforts of the Greek government to secure United Nations action on its charges that Yugoslavia, Albania, and Bulgaria were aiding the guerrillas were frustrated by Russia's veto on action by the Security Council and the Soviet rejection of the Balkan Commission created by the General Assembly (see "United Nations"). As a result, the Greek rebels continued to count among their advantages a standing invitation from the Yugoslav, Albanian, and Bulgarian governments to cross their borders whenever they found it necessary to flee from the Greek regular army. From the point of view of the United States, the failure of the United Nations to seal off the Greek frontiers was a matter of great concern, for the program of American aid to Greece rested upon the assumption that the Greek army would be obliged to deal only with Communist-led bands within Greece itself.

ADMINISTRATION OF AID TO TURKEY

Administration of the Turkish aid measure was beset by fewer problems. After a 20-member American survey group, headed by Maj. Gen. Lunsford E. Oliver, investigated the needs of the Turkish armed forces during the summer, various kinds of American military equipment began to reach Turkey in considerable volume. Although the specific items supplied to Turkey under the program were not revealed because of considerations of security, the United States let it be known that approximately $90,000,000 would be spent in re-equipping the Turkish military, naval and air units; $5,000,000 on arsenals and repair facilities for motorized equipment; and $5,000,000 on road building and repairs.

NEED FOR LONG-TERM AID PROGRAM

Viewed in the broad perspective of Soviet-American relations during 1947, the Truman Doctrine as expressed in the emergency aid program for Greece and Turkey, constituted only a stop-gap device to halt the spread of communism until some long-term program for coping with Russian expansion could be evolved. Even at the very moment that the President went before Congress to request special assistance for the Greek and Turkish governments, he and his advisers were convinced that other countries would soon need similar help in withstanding Russian pressure. This impression was strengthened in the mind of Secretary of State George C. Marshall during the Moscow Conference (March 10-April 24), when the Big Four Foreign Ministers met for the first time to discuss treaties of peace for Germany and Austria. At this Conference, Secretary Marshall became convinced that the Russians were employing delaying tactics in the hope that they might reap a Communist harvest if Western Europe were unable to regain its economic strength quickly, but exactly what form of American help should be offered to Western Europe to help it withstand communism posed a difficult question. Not only were Europe's needs imperfectly known in Washington, but the majority of the Eightieth Congress was committed to the reduction of government expenditures. The Administration realized, therefore, that it would have to provide definite proofs of Europe's needs and a specific plan for American aid before asking Congress for any sizable appropriation.

THE MARSHALL PLAN

On June 5, Secretary Marshall, in a short speech delivered before a meeting of Harvard alumni in Cambridge, made an important suggestion as to the course American foreign policy toward post-war Europe should take. After discussing the serious situation facing the world and the more important reasons for Europe's difficulties, he turned toward the future and proposed a new approach to the problem of reconstruction and the role the United States could play in it.

Reduced to their essentials, the points Secretary Marshall made in his significant statement were: (1) Europe must have help from the United States during the next three or four years if it were to avoid complete collapse; (2) the United States should do whatever it could to prevent such a collapse because its consequences for this country would be very serious; (3) our policy in this crisis should be neither anti-Russian nor anti-Communist, but in favor of peace, prosperity, and freedom for all; (4) American aid should not be given piecemeal and on a spur-of-the-moment basis, but should aim at a general and permanent cure; (5) the United States would cooperate with any government that wanted to work for recovery, but it would oppose any government or group that sought to block recovery for its own ends; (6) the time had come for the nations of Europe to take the initiative in determining what they needed from the United States and what they could do to help themselves and each other; (7) the United States should offer friendly aid in the drafting of a joint program, by all the nations of Europe if possible, and then support it to the best of its ability.

In the first two of these seven points Secretary Marshall stated the problem created by the economic crisis in Europe and indicated the general approach which should be adopted in solving it. The next three were concerned with the relation of Russia to a European recovery program. In these points, Marshall veered away from the "stop Russia" aspects of the Truman Doctrine and held open the door to Soviet cooperation in recovery, provided always that Russia would not interfere with the program. Point six, that Europe must take the initiative, was the heart of what promptly became popularly known as the "Marshall Plan." According to Secretary Marshall's concept, only the Europeans themselves could bring about their own rehabilitation, regardless of how much aid the United States might give, and they should, therefore, set to work on this project if they expected the United States to assist them in doing the job. Point seven carried with it the assurance that, if the European nations, or most of them, came forward with a recovery plan in which they undertook a maximum of self-help, the United States would assume responsibility for offering all the aid it could to make the program successful.

RUSSIAN OPPOSITION TO THE MARSHALL PLAN

Secretary Marshall's speech of June 5 set off two related series of events, one in Europe and the other in the United States. France and Britain promptly welcomed the proposal, but both were obviously uneasy lest, in doing so, they enable Moscow to interpret their action as anti-Soviet. Their hesitation on this score was overcome, however, when the American Secretary of State told a press conference that he meant to include all of Europe west of Asia, specifically the British Isles and Russia. Thereupon British Foreign Minister Bevin flew to Paris on June 17 to consult with French Foreign Minister Bidault, and the following day the two men invited Soviet Foreign Minister Molotov to join them. After some delay, Russia accepted the Anglo-French invitation, and on June 27 M. Molotov arrived in Paris accompanied by a large delegation of experts. However, after only five meetings the Russian representative decided to leave the conference. The Soviet delegation insisted that the European nations should merely add up their requirements for aid and present this bill to the United States. Any other procedure, the Russian representatives maintained, would involve American intervention in Europe's domestic economic affairs. The French and British, on the other hand, maintained —in accord with Secretary Marshall's clear statement on this point—that Europe should first jointly construct a program of self-help, and they decided to proceed without Russia in calling a general European conference to formulate such a plan. As they were well aware, this action would broaden the gap between East and West, particularly since the Soviet Union refused to permit the governments of eastern Europe to accept the Anglo-French invitations to consider what response should be made to the American proposal.

FOUNDING OF THE COMINFORM

In a further effort to defeat the Marshall Plan, Communist representatives of nine European nations announced Oct. 6 that they had held a secret meeting in Poland and established a new Communist International Information Bureau with headquarters in Belgrade. This "Cominform" was generally viewed in the United States as representing the revival of the Comintern, which Stalin had formally dissolved in 1943 in a gesture of friendship toward the Western powers. Creation of the Cominform was thus believed to indicate a complete break on the part of the Communist parties of the member nations —the U.S.S.R., Poland, Hungary, Rumania, Yugoslavia, Bulgaria, Czechoslovakia, France and Italy—with their wartime policy of cooperation with the West. The strongly anti-American character of the Cominform was emphasized Oct. 22 when Col. Gen. Andrei A. Zhdanov, one of its founders and a member of the Russian Politburo, called upon the new organization to thwart the Marshall Plan as an instrument designed to achieve "world domination by American imperialism."

SIXTEEN NATION CONFERENCE (CEEC)

The 16 nations which accepted the Anglo-French invitation to a general European conference to consider a reply to Secretary Marshall's suggestion of June 5 were Austria, Belgium, Denmark, Eire, France, Great Britain, Greece, Iceland, Italy, Luxembourg, The Netherlands, Norway, Portugal, Sweden, Switzerland, and Turkey. Their total population of 270,000,000 (including western Germany, which was indirectly represented by the occupying powers) was approximately half the population of all Europe west of the Urals and roughly twice that of the United States.

Representatives of the 16 nations convened at Paris July 12, organized themselves into a "Committee of European Economic Cooperation" (CEEC), established four technical subcommittees to report by Sept. 1, and adjourned July 15. The four subcommittees considered problems of food and agriculture, fuel and power, iron and steel, and transport. Among the problems which beset the conference were those arising from uncertainty concerning the future of Germany and from the vagueness as to the amount of aid they might expect to receive from the United States. When unofficial reports began to reach Washington that the 16 nations' total requirements for outside aid might come to the sum of $29,200,000,000 over four years, the Administration was greatly disturbed because of its belief that there was little chance that Congress would approve such a large sum. Accordingly, the State Department hastily dispatched several officials to Paris to encourage the conference to reexamine its estimates with a view to paring them down. Moreover, Washington felt it was essential, not only to Congressional approval but to the success of European recovery plans, that there be specific provisions for cooperative efforts on the part of the European nations, and American officials accordingly encouraged more precise plans along this line.

EUROPE'S REPORT TO WASHINGTON

The general report of the Committee of European Economic Cooperation, a document of some 25,000 words and elaborate appendices of supporting data, was forwarded to President Truman Sept. 22. The report described the steps which the conferees would take themselves, individually and collectively, in behalf of economic recovery, and set forth estimates of the help they would need from abroad to put their program into effect.

As far as self-help and mutual cooperation were concerned, the 16 nations declared a three-fold intention. First, they undertook to expand their production of major commodities during the next four years in accordance with specified annual targets. The major commodities which they felt needed particularly close attention were food, coal, electric power, oil refining, steel, inland transport, and merchant shipping. The four-year production plan outlined in the report called for an increase in production on the same scale as that witnessed in the realm of industrial mobilization in the United States from 1940-44, and was admitted to constitute a high goal. American experts who subsequently analyzed the report generally concluded that the 16 nations had probably been over-optimistic in setting their aims for attainment by 1951. Second, the 16 European nations undertook to strengthen their internal financial stability in order to provide a sound foundation for maximum progress in recovery. In this section of the Paris report the CEEC nations pledged themselves to do whatever they could to exercise more control over their currencies, to curb inflation, and to balance their budgets. They felt obliged to observe, however, that the difficulties facing them in this connection were very great, and that in order to put a foundation under their currencies they would need a stabilization fund estimated at $3,000,000,000.

In another important section of the report, the CEEC nations agreed to cooperate more fully among themselves to increase trade and production through mutually helpful action. This section on mutual assistance among the CEEC nations was perhaps the most significant section of the Paris report. As was well-known at Paris the United States hoped that a plan for an all-European customs union might emerge from the conference, thus establishing a new and possibly fruitful approach to the problems of European recovery. However, the 16 nations' representatives felt that, while they approved this idea in theory and were willing to set up a special committee of their own to study it, an over-all customs union could be realized, if at all, only progressively, since a sudden removal of trade barriers would force many European producers out of business and produce economic chaos. In the meantime, they acknowledged their need to revive trade among themselves and the rest of the world by removing trade barriers as soon as possible.

After canvassing the possibilities for self-help the CEEC report went on to add that its signatories would need outside assistance if they were to regain their ability to support themselves. Under present conditions, they pointed out, this outside help would have to come mainly from the United States. Measured in billions of dollars at prices of July 1, 1947, the CEEC report showed the need for imports from the United States, from the other nations in the Western Hemisphere, and from the remainder of the world in the following amounts:

	U. S.	Other Western Hemisphere Countries	Other Parts of the World	Total
1948	$6.0	$3.2	$4.7	$13.9
1949	5.3	3.9	5.4	14.5
1950	4.8	3.8	5.9	14.5
1951	4.3	3.9	6.2	14.4

Under this schedule, import requirements from the United States would start out at a high figure in 1948 and drop gradually through the following three years until by 1951 Western Europe's import relations would be at least somewhat similar to those which prevailed during the pre-war period, when only approximately 45 per cent of western European imports came from the American continent, as compared with an estimated 75 per cent in 1948.

The goods which the CEEC hoped to obtain from the United States (in billions of dollars at July 1, 1947 prices) were:

	1948	1951	1948–51 Total
Food and fertilizer....	$1.5	$1.2	$5.4
Coal................	.3	.05	.7
Petroleum products...	.5	.55	2.2
Iron and steel........	.4	.3	1.2
Timber.............	.1	.1	.4
Equipment..........	1.1	.6	3.3
Other imports (mostly raw materials)......	2.1	1.5	7.2
Total..........	$6.	$4.3	$20.4

The CEEC countries declared that they expected to be able to pay for some part of what they needed from the United States and from other American republics through exports. In 1948, for example, they estimated that they would be able to export $850,000,000 of goods and services to the United States and $1,480,000,000 worth in 1951, thus reducing the deficit in that year to an estimated $2,620,000,000. In the meantime the four-year total western European deficit in balance of payments with the United States was figured at $15,810,000,000. This meant that the possible cost to the United States of American aid to European recovery under the Marshall Plan would be about $16,000,000,000, or about $28 a year per person in this country for four years.

ABILITY OF THE UNITED STATES TO AID EUROPE STUDIED

During the period from June until September, when Washington was awaiting the report of the 16-nation Committee for European Economic Cooperation, the United States was engaged in an examination of its capacity to underwrite a large program of aid to Europe. On June 22, President Truman announced the creation of three special inventory-taking groups. One made up of specialists within the government and headed by Secretary of the Interior

Krug, was asked to survey "the state of our national resources" in order to answer the question of whether the United States could export everything Europe needed without dangerously reducing this country's own supplies. This committee completed its work Oct. 7. It reported that the natural resources of the United States were sufficient to support a considerable foreign aid program without endangering this country's national security or standard of living. The second group consisted of President Truman's Council of Economic Advisers, under the chairmanship of Dr. Edwin C. Nourse. After analyzing "the impact on our national economy of aid to other countries," the Nourse group declared Oct. 28 that the American economy could "sustain the general impact of the foreign-aid program, providing we deal promptly and effectively with problems raised by key commodities," such as wheat, steel, certain items of industrial and agricultural machinery, coal, and fertilizer.

The third committee appointed by President Truman was a non-partisan group of 19 civilians—businessmen, lawyers, agricultural experts, labor leaders, economists, and administration experts—under the chairmanship of Secretary of Commerce Harriman. This Committee on Foreign Aid submitted a 125,000 word report Nov. 6. It studied the broad aspects of the aid program in order to advise the President "on the limits within which the United States may safely and wisely plan to extend such assistance." The general principles which the Harriman committee declared should govern American aid to Europe under the Marshall Plan were four in number. First, the report stated that the United States should help Europe to help itself through the development of its resources and the opening up of its channels of private trade and financing. Second, private capital should be encouraged to go to work in Europe. In addition to currency stabilization, the report explained, this meant the reduction of restrictions and regulations and a freer movement of men and money. Third, a clear distinction should be drawn in methods of financing and administration between emergency relief—the food and fuel program, which should diminish rapidly, and which might take the form of an outright gift of $3,000,000,000—and reconstruction. In the field of reconstruction, the report advised the United States to emphasize the use of more normal channels, to contemplate loans rather than grants, to use various existing international agencies to the full, and to use the resources of private enterprise. Finally, the report declared that the impact of the program on the United States must be cushioned. While the amounts involved in aid under the Marshall Plan might seem modest compared with total American resources, it stated, they were marginal amounts in the economic sense with respect to our foreign trade and the demands on our commodity markets. Under these conditions, the report concluded, the agencies charged with executing the program must adapt their operations from time to time to the condition of American markets and with regard to the essential need for economic stability in the United States as a keystone to world recovery. If these principles were followed rigorously and persistently the Harriman committee assured President Truman that the United States had the means to meet the critical needs of Europe.

STOP-GAP AID TO AUSTRIA, FRANCE, AND ITALY

With the acceptance of the Harriman report, the Truman Administration virtually completed its preliminary work on the European Recovery Program, as the Marshall Plan was formally called. Meanwhile, however, it had become clear in Washington that several European countries would suffer such hardships during the winter of 1947-48 that their democratic institutions might collapse before the Marshall Plan could be put into operation. At first the Administration hoped that sufficient stop-gap aid for these particularly needy countries could be secured from already existing funds, but this hope soon proved illusory, and the President concluded that a special session of Congress should be called to consider the need for interim aid and the related problem of growing inflation in the United States.

In the message which President Truman delivered in person to the opening meeting of the special session of Congress Nov. 17, he called for an immediate appropriation of $597,000,000 for winter relief to France, Italy, and Austria. This aid was essential, the President declared, if the economies of these countries were to survive the coming winter and their political and economic systems to escape disintegration. After a month's debate, Congress approved Dec. 20 an interim relief appropriation of $540,000,000 for France, Italy, Austria, and China.

On the same day that the interim aid measure was approved, and less than a week after the failure of the London session of the Council of Foreign Ministers to make any headway on a German settlement, President Truman sent Congress a completed outline of the proposed European Recovery Program. In presenting the ERP, which represented the work of thousands of experts on both sides of the Atlantic, the President declared: "The economic plight in which Europe now finds itself has intensified a political struggle between those who wish to remain free men living under the rule of law and those who would use economic distress as a pretext for the establishment of a totalitarian state." Although the ERP could not be thoroughly examined and discussed until the regular session of Congress convened Jan. 3, 1948, the President advised the legislators that he would seek an appropriation of $6,800,000,000 for the first 15 months and an authorization of $17,000,000,000 for a four-year period. Meanwhile, statements by various political leaders indicated that the forthcoming debate on the ERP would center around its cost, the terms under which American aid was offered, and the effect of the plan on the American economy.

OCCUPIED JAPAN

By Ardath W. Burks
Fellow, School of Advanced International Studies

THE UNITED STATES IN JAPAN AND KOREA

Throughout the year 1947 the United States continued as the Allied power chiefly responsible for the military government of Japan. In general, American policy followed the terms laid down in the Potsdam Proclamation and the "United States Initial Post-Surrender Policy for Japan" of 1945. That policy had two basic objectives: to preserve the predominant position of the United States, won in the Pacific war; and to meet the legitimate rights and interests of the other Allies. General of the Army Douglas MacArthur, in his capacity as Supreme Commander for the Allied Powers (SCAP), continued to exercise military and administrative authority in Japan.

Though the majority of the other Allies approved the initiative of the United States in the occupation of Japan, three of the members of the Allied Council in Tokyo, representing the British Commonwealth, China, and Russia, criticized specific failures from time to time. Both the British and Russian representatives stressed economic weaknesses in Japan's reconstruction; the Chinese member submitted questions on repatriation and demobilization. China's Premier Chang Chun, in a statement before the Kuomintang Central Executive Committee meeting in Nanking Sept. 9, opposed what he termed the American policy of fostering Japanese strength. At the British Commonwealth Conference on Japan which opened in Canberra, Australia, Aug. 26, the United States was invited to assume the initiative in negotiating a peace settlement, just as it had taken the leadership in the occupation. Russian dissatisfaction with American policy in the United States Zone of Germany was matched by criticism directed at the military government in Japan and American policy in southern Korea.

On May 3, 1947, Constitution Day, Japan became a parliamentary monarchy. On that day the new constitution, which was promulgated by the Emperor on Nov. 3, 1946, went into effect. Japan received the right again to fly the flag of the Rising Sun over public buildings. After Sept. 1, however, the Emperor's familiar chrysanthemum crest was no longer to be used on postage stamps.

A preliminary census taken Oct. 1 revealed that a total population, in round numbers, of 78,600,000 Japanese were crowded into an area less than the size of California; these people had become an increasingly heavy burden on the American taxpayer. Two years after her surrender, Japan reached a precarious economic balance that had been maintained and could be maintained for a long period only through constant material assistance from the United States. The unsettled reparations problem, the unfavorable trade balance to the extent of $200,000,000, and the unwieldy wage-price structure demanded government subsidies which increased inflation.

Japanese hopes for an end to the occupation were raised by the March 17 press conference in which General MacArthur advocated early negotiation toward a peace treaty. But official United States proposals for a preliminary conference in August were blocked, and at the end of the year Japan remained an occupied country. In May, the Supreme Commander announced that he intended to see the occupation through, regardless of its length.

The war-torn Ryukyu (Loochoo) Islands, including Okinawa, had been transferred from the U. S. Navy to the U. S. Army administration in July, 1946. The people, long dominated by the Japanese, enjoyed increased participation in their local government; but the Japanese revealed their intention to ask the return of the island group to Japan in the peace settlement. In July the Prefectural Assembly of Hokkaido, Japan's most northern island, petitioned General MacArthur to obtain the return of the Russian-occupied southern Kurile Islands.

Whereas the Japanese in 1947 began to react to Allied occupation like a liberated people, the Koreans reacted to military government like a conquered country. Korea continued divided between the United States and Soviet commands at 38° N. latitude. Despite further American efforts toward Koreanization of the administration of southern Korea, the failure of bilateral negotiations during the year finally forced submission of the question of the future of all Korea to the United Nations.

ALLIED POLICY CONTROLS

The legitimate rights and interests of the Allies in the policy of the occupation of Japan were expressed through the Far Eastern Commission, established by agreement at Moscow in 1945. With members representing 11 governments which participated in the war against Japan, the Commission met throughout 1947 in the former Imperial Japanese Embassy in Washington. Its chairman was Maj. Gen. Frank R. McCoy, the American member; its Secretary General was Nelson T. Johnson, former United States Ambassador to China.

The Commission was designed to be a policy-making body; it has continued to be, in fact, advisory. According to its Terms of Reference, military problems and territorial adjustments were excepted from its sphere of authority. It was to formulate policies, principles, and standards whereby Japan would fulfill obligations under the terms of surrender. The Commission could review directives issued by SCAP to the Japanese government. In the Commission's proceedings there was a veto provision, since no policy could be decided without the approval of a majority of its members including the United States, United Kingdom, U.S.S.R., and China. Finally the Commission had to respect existing control machinery including the American military chain of command.

Any member of the Commission might call for the review of any policy implemented in the occupation, and the year was an active one for the Far Eastern Commission. Important economic policies were defined, and the reparations problem moved slowly toward the settlement of shares of each country established on broad political principles. It was decided that Japan's new constitution should be reviewed for possible amendment. Attention was turned to educational reform. Most important, a basic policy to govern the occupation of Japan until the peace treaty is signed, was issued by the FEC. This statement in effect was an Allied ratification of the United States post-surrender policy statement sent by President Truman to General MacArthur on Sept. 6, 1945. In brief, it reiterated basic Allied objectives: to limit Japan's sovereignty to her principal islands; to disarm the country completely; to encourage the people to develop democratic ideas and organizations; and to reform basically the nature and direction of Japanese economic activity and institutions. Allied authority was to continue through the military occupation; the Emperor and Japanese state were to be subject to the Supreme Commander, who would use the existing form of government in carrying out the program.

Policy decisions originating in Washington then were of two types. The first type involved the following steps: (1) the FEC initiated or reviewed directives communicated through (2) the United States Government, the Joint Chiefs of Staff acting as a channel to (3) the Supreme Commander for the Allied Powers, who received advice from (4) the Allied Council for Japan, before transmitting directives to (5) the Imperial Japanese Government. The second type included directives prepared for SCAP by the United States Government, following the policy already laid down by the FEC; or concerning matters of an emergency nature, to be reviewed later by the Commission. Such limited interim directives were not to change constitutional structure or the Japanese government as a whole. Within the American Government, occupation policy originated in the State-Army-Navy-Air Force Coordinating Committee (SANACC), with advice from other departments including Commerce and Treasury. Such directives were transmitted by the Department of the Army as executive agency through the Joint Chiefs of Staff to SCAP. Ultimate authority for implementation and interpretation of all policy was, of course, in the hands of SCAP in Tokyo.

THE OCCUPATION

Within Japan the initials SCAP continued to stand for two functions. As Supreme Commander for the Allied Powers, General MacArthur was solely responsible for implementing Allied policy. In addition, SCAP was Headquarters for a military staff. HQ SCAP consisted of nine staff sections: Economic and Scientific, Civil Information and Education, Natural Resources, Government, Legal, Civil Intelligence, Public Health and Welfare, Civil Communications, and Statistical and Reports. Also attached to HQ was the International Military Tribunal for the Far East, including the United States section of the prosecution staff and prosecutors for the other Allies.

The Japanese Central Liaison Office (CLO), established in 1945, continued to accept commands and to route them to the Japanese administration for action. There was, of course, informal liaison between members of

SCAP at the staff level with the appropriate ministries in the Japanese government. SCAP no longer served as a channel for directives concerning Korean military government functions (see p. 114); it continued to exercise military command over troops in Korea.

Under GHQ SCAP, military government functions in Japan were exercised through military commands of the occupying forces, chiefly the American Eighth Army. There were about 5,000 British Commonwealth Occupation Forces based in southern Honshu and in Shikoku, but they had no direct military government functions. To these troops were assigned United States military government teams.

Attached to SCAP in Tokyo was a chief political adviser, a career diplomat. As deputy to the Supreme Commander, the political adviser served also as United States member of the Allied Council for Japan.

THE ALLIED COUNCIL FOR JAPAN

The Council continued as a four-power body available for consultation on-the-spot in Japan. It did not have the same broad scope of authority which was delegated to the Far Eastern Commission in Washington. During 1947, there was a complete change of representatives serving on the Allied Council. The United States, the Allies, and even Japan suffered a severe loss on Aug. 17 when the aircraft carrying George Atcheson, Jr., American member and Chairman of the Council, disappeared near Hawaii on a flight from Tokyo to Washington. Atcheson was succeeded by William J. Sebald, graduate of the United States Naval Academy and Foreign Service Officer. During the same week, W. MacMahon Ball, British Commonwealth representative, announced his resignation. He was replaced by Patrick Shaw. Lt. Gen. Kuzma Derevyanko, Soviet representative and critic of American policy, was relieved for a time by Maj. Gen. Kislenko. The new Chinese representative was Gen. Shang Cheng. Meetings of the Council continued to produce vitriolic debate. Important problems discussed included repatriation of Japanese to their homeland, the progress of economic reform and reconstruction, and basic educational reform.

THE NEW CONSTITUTION

From the surrender in 1945 to Nov. 3, 1946, the Japanese government had operated under the pre-war 1889 (Meiji) Constitution and had complied with Allied control through the old machinery of state. From the transition year of 1946, Japan moved during 1947 to a complete renovation of her organic law. The final draft of the new constitution, prepared after vigorous prodding by SCAP and proclaimed by the Emperor the previous November, went into effect on May 3, 1947. With all the pomp and ceremony of which the defeated country was capable, Japan legally renounced war forever and transferred the exercise of sovereignty from a "divine" emperor to the will of the people. A downpour of rain marred Tokyo's celebration of Constitution Day. The tone of Japanese press comment on the constitution was generally favorable and hopeful.

The new organic law followed closely constitutional principles approved by the Far Eastern Commission. The Japanese executive was to derive authority from and be responsible to the electorate through a representative legislative body. The ministers of state were to be collectively responsible to the legislature. The legislature was to have full financial power. The judiciary was to be independent. The Emperor, if retained as an institution by the expressed will of the Japanese, was to act on the advice of the Cabinet and was to have no independent executive power. On March 27, the Far Eastern Commission announced that it had directed General MacArthur to provide for a review of the new constitution by the Japanese people within one to two years. A referendum was made possible but not compulsory.

Within the new constitution a bill of rights guaranteed everything which the old constitution had assured to the people, but basic freedoms were no longer subject to legislative limitation. Throughout the year, the Diet implemented the new constitution by revisions of basic penal and administrative law. By midyear, occupation officials saw the end of Japan as a police state. Decentralization of the police system had progressed so far by Sept. 16 that the Japanese were granted permission to increase their police force. There were plans to abolish the Justice Minister and to create the post of Attorney General. A new criminal code abolished even the old *lèse majesté* law which provided up to 15 years' imprisonment for anyone guilty of disrespect toward the Emperor and his family.

THE EMPEROR

Certainly as a legal institution and apparently as a person, the Emperor became a limited monarch in Japan. Constitutionally his role was made minor: like the British king, he appoints the new premier, who is actually elected by the Diet; and dissolves the House of Representatives on the advice and approval of the Cabinet. During the two years of occupation as in the original surrender, the Emperor has occasionally acted also as a direct channel of command from SCAP to the Japanese government. Though the subjects of such interviews have usually been referred to as routine matters, Emperor Hirohito held his fifth conference with General MacArthur on Nov. 14. The Emperor continued to move about Japan and to be seen among the people. Significantly, in speeches of Aug. 7 and Dec. 7, he symbolized the Japanese people's memory of Hiroshima as a counterweight to America's memory of Pearl Harbor.

At home, the Emperor shared to some extent the hardships of his people. In their first joint press conference on June 3, the Emperor and Empress described their food as the same that was granted other Japanese under the rationing system. The Emperor could not order a new suit. During the year, the part-time tutor of Crown Prince Akihito (Mrs. Elizabeth Gray Vining) briefly returned to the United States and described the progress of her pupil's schooling.

JAPAN'S NEW GOVERNMENT

Under the new constitution, the independent judiciary is granted the power of constitutional review much like the American system. Members of the court are appointed by the Cabinet and invested by the Emperor. The Government named 15 justices during the first week in August. Unlike the United States Supreme Court, however, Japan's highest judicial tribunal will serve until the next general election when the voters have the privilege of recall.

In the executive branch, one of the most radical changes from the previous structure was the final abolition on Oct. 8 of the once powerful Japanese War and Navy ministries. First converted into demobilization ministries after the surrender, then further reduced to bureaus in 1946, their remaining functions were transferred to the government's Welfare Ministry.

The year 1947 was an election year in Japan. Voters went to the polls to select their representatives at all levels of government. Provincial governors and city mayors were popularly elected for the first time in Japan; an elected upper House of Councillors replaced the old House of Peers; and a new House of Representatives reflected post-surrender party lineups which in turn produced a new coalition cabinet.

THE NATIONAL ELECTIONS

Japan entered the year 1947 with its fourth government since the surrender, the cabinet of Premier Shigeru Yoshida. In January, the pressure of political parties and the possibility of further political purges already threatened the Yoshida administration. A mass resignation was temporarily warded off by dropping three members of the Cabinet, dismissing the head of the Economic Stabilization Board, and reshuffling the remaining ministers. Nevertheless, a nationwide poll by the newspaper *Asahi* in early February revealed that almost 50 per cent of the Japanese people opposed the government of Yoshida and were swinging to support the rising Socialist party. On Feb. 7, General MacArthur directed the Japanese government to hold general elections "as soon as practicable." On March 31, the ninety-second Japanese Diet and last under the old Meiji Constitution, dissolved. The old House of Peers closed forever.

The local elections of April 5 opened a month of intense political activity in Japan. They also marked the first time the Japanese people elected, by a democratic process, governors for their 46 prefectures, and mayors for their five largest cities. This first test of strength seemed to indicate a sweep by independents running without party labels but generally in support of the Yoshida government. Only about one per cent of the votes cast in mayoralty elections went to the Communists.

The election of the House of Councillors, April 20, though less important than that of the Representatives, still attracted a larger number of national figures than the earlier local elections. It was estimated that more than one-third of the electorate abstained from voting. In this test, independent, moderate conservatives again seemed successful, though the largest number of seats won by a single party went to the Socialists. The climax of the political campaign came with the elections of April 25 for the lower House of Representatives. Political observers estimated that about as many votes were cast as in the election of April 1946. The Japanese watched the outcome with interest for, in all likelihood, from among successful candidates elected for four years would come the government which would sign a peace treaty with the Allies. With elections for prefectural councils on April 30 and runoffs completed, Japan had a new government when the constitution went into effect in May.

THE NEW DIET

Japanese political parties, though they had failed as parties to continue during the war, inherited a parliamentary tradition which survived the repression of reactionary wartime premiers. In general, the Liberals and Democrats represented conservative elements. The Socialists, weakened by party splits, and the People's Cooperatives held the middle Left. Communists appealed to organized labor and the extreme Left. There was no organized extreme Right. As of the elections of April 20, the political affiliations of the 250 members of the House of Councillors were as follows: Socialists, 46; Liberals, 39; Democrats, 32; People's Cooperatives, 10; Communists, 4; minor parties, 7; independents, 112. On May 21, the upper house selected as President Tsuneo Matsudaira, former ambassador to Washington.

In the lower house, as of the election of April 25, party strength was consolidated, and there was a reduction of minor party participation. Three major parties emerged almost equal in strength, necessitating a tenuous coalition Cabinet. The House of Representatives was then composed of: Socialists, 143; Liberals, 132; Democrats, 126; People's Cooperatives, 31; Communists, 4; minor parties, 17; independents, 13. In comparison with the 1946 results, the rise of the Socialists was the most significant change. Yet, conservative forces, represented by Liberals and Democrats, continued to hold between them a majority of the House and even to increase their combined membership over 1946. Women won only 15 seats in the new election, as compared with 39 in 1946.

Though the Emperor Hirohito convoked the new Diet for May 20, delays caused by selection of a new Cabinet meant that the legislature did not actually get down to work until July. Nevertheless, in 1947, the

Diet sat through 204 days, the longest session in Japanese parliamentary history.

THE NEW CABINET

For a time after the national elections of April, the Yoshida Cabinet delayed resignation because the Premier's Liberal party, combined with the affiliated Democrats, held the majority. Through May, the four leading parties negotiated on policy and finally decided upon a new Premier. On May 23, Tetsu Katayama—Socialist, Christian, pre-war labor lawyer—was elected by the Diet to serve as the first premier under the new constitution. The entire process took 41 days from the election as compared with 42 days required to select a leader the previous year. The Cabinet installed on June 1, with subsequent changes, was as follows:

Foreign Minister: Hitoshi Ashida (Dem.); Home Minister: Kozaemon Kimura (Dem.; Ministry abolished Dec. 31, 1947); Finance: Shotaro Yano (Dem., replaced in June by) Takeo Kurusu (Dem.); Justice: Yoshio Suzuki (Soc.); Education: Tatsuo Morito (Soc.); Welfare: Sadakichi Hitotsumatsu (Dem.); Agriculture: Rikizo Hirano (Soc., purged in Dec., 1947; replaced by) Kanae Hatano (Soc.); Transportation: Gizo Tomabechi (Dem., replaced in Dec. by) Tokutaro Kitamura (Dem.); Communications: Takeo Miki (P.C.); Labor: Mitsusuke Yonekubo (Soc., Ministry established in Sept.); Ministers Without Portfolio: Suehiro Nishio (Soc., concurrent Chief Cabinet Secretary); Hiroo Wada (ind., concurrent Director-General, Economic Stabilization Board); Junzo Sasamori (P.C.); Takao Saito (Dem.); Giichi Takeda (Dem., appointed in Dec.); Heima Hayashi (purged).

One of the first steps the Katayama Cabinet took was to introduce a draft of a new civil service law affecting 2,000.000 government employees, many of whom constituted a stumbling block in the path of democratization. Plans were also discussed to reduce the number of Japan's splinter parties in the Diet. But the issues which mainly endangered the Cabinet's leadership were economic. Measures to increase coal production brought labor opposition; the conservatives mustered their strength against even a watered-down coal nationalization bill; and government workers assailed the government wage ceilings. By the end of the year, the lineup in the House of Representatives had shifted; the Socialists lost 15 seats, 12 to the new Hirano Faction; the Liberals and Democrats lost 32 seats, 22 to a new group led by former Premier Yoshida. The trend was conservative, but the opposition was still split. In the upper house, the Socialists held their own as did the Liberals; but the Democrats jumped to second place with 46 seats, and a group of independents, the new Ryokufukai, appeared. The Communist Line, incidentally, swung from "socialist revolution" to completion of the "bourgeois revolution."

DEMOCRATIZATION

War crimes trials of former Premier Hideki Tojo and the other major Japanese wartime leaders before the International Military Tribunal, ground on through the defense arguments. For a time in October, the testimony of Marquis Kido (former Lord Keeper of the Privy Seal) threatened to embarrass the position of the Emperor himself. But the arrogant defense of General Tojo and the unwillingness of the prosecution to involve the Throne postponed further challenge to the Imperial position. Though the Socialist Cabinet dropped Rikizo Hirano as Agriculture Minister, the Central Screening Committee for the first time defied the Government Section of SCAP in refusing to purge Hirano.

In the field of educational reform, the Far Eastern Commission in April directed SCAP to commence widespread decentralization of the Japanese school system, to encourage the publication of progressive textbooks, and to make available foreign books to libraries and teachers. In November, the Chinese member of the Allied Council led a unanimous attack on the lack of educational progress under the occupation.

In the field of religion, Japanese Buddhism suffered from schisms among a growing number of sects. Sectarian Shinto seemed to be registering spectacular gains. Christianity and foreign missions in Japan were severely hampered in their work by the official rate of conversion between the dollar and the yen.

GENERAL ECONOMIC CONDITIONS

In contrast to the legal progress of Japan toward parliamentary democracy, the economic reconstruction of the country faced tremendous obstacles. On April 18, the FEC established the principle that the peaceful needs of the Japanese people could be defined as a standard of living prevailing in 1930-34.

Certain key statistics released by SCAP at the end of the year proved that such a standard was only a distant goal. With 1930-34 as a base year (100 in the index), over-all industrial production had risen from a low of 31.8 in 1946 to only 41.3 in June and to 42.6 in October 1947. Mining activity had risen to an index of 90.6 by October, but manufacturing rose from 26.6 in 1946 to only 35.2 by October 1947. Japan, which produced about 100,000 metric tons of pig iron and twice that amount of crude steel in an average month during the years 1930-34, had a monthly total of about 30,000 tons of pig and 94,000 tons of steel in October 1947.

Coal was a critical economic and political item during 1947. The Japanese mined 2,500,000 tons in October; yet General MacArthur informed Premier Katayama in September that Japan must guarantee a production of 50,000,000 tons a year. This figure was reached during the war years, but is far in excess of 1930-34 average production. Two bright spots appeared in the production indices: ammonium sulphate, used as fertilizer, was produced at the rate of 60,000 metric tons, monthly total in October (22,000 to 41,000 monthly average, 1930-34); and electric energy generation topped 3,000,000,000 kilowatt hours monthly total in July (about 1,500,000,000 kwh, 1930-34).

Prices and wages, the supply of food, and the unsolved reparations tangle continued to plague the Japanese economy. A glance at the consumer price index demonstrates what was happening in the first category. SCAP figures for the expenditures of 5,000 urban families in 28 representative cities took the period August 1946-March 1947 as a base (100). By March 1947, the index reached 137.7; by May, it was up to 166.8; and, in July, it hit a peak of 227.7. The figure for Tokyo alone in August was 239.3.

The Katayama Cabinet staked its future on the control of Japan's tottering economy. In a so-called White Paper of June, the government pledged an attack on the black market, wage controls, abolition of producers' subsidies, revamping of the allocation system for raw materials, and budget revision. Despite valiant efforts, the Cabinet was forced to make a general adjustment upwards in official prices to 65 times the 1934-36 base level. A gradual retreat from the standard wage of 1,800-yen per month resulted in a year-end three months' bonus to government workers, and, finally, abandonment of the standard wage. Private employers were paying an estimated monthly average of 2,800 yen (about $56 at the official conversion rate).

FOOD

On March 28, the Supreme Commander wrote to the Japanese Premier that future imports of food from the United States would be calculated on Japan's maximization of domestic supplies and their equitable distribution. The Economic Stabilization Board set a goal of 2,100 calories daily as an average diet. The government ration provided about 1,246 calories; even with the black market, the national average was guessed to be about 1,750 calories. It was officially estimated that Japan's shortage in domestic food production for the year amounted to about 2,000,000 tons, roughly equal to what was imported largely in the form of American cereals.

Soviet and American representatives on the Allied Council agreed on a plan for democratization of Japanese inshore fishing administration. Both Britain and Australia, however, criticized General MacArthur's decision to permit the Japanese to conduct whaling expeditions in the Antarctic. Sea foods continued to be an important item in Japan's food supply.

LAND, LABOR, AND CAPITAL

Progress of the program of land reform, under the law passed in September 1946, came in for criticism, particularly by the Soviet member of the Allied Council. Many of the local committees selected to underwrite the purchase of land for individual families were found to be unsatisfactory. During the year, the Government passed an Agricultural Cooperative Association Law designed to remove rural groups from state domination.

The effect of General MacArthur's order of Jan. 31, 1947 canceling a threatened general strike of civilian employees of the government, was to bring a strike holiday generally throughout organized labor during the year. The National Congress of Industrial Unions (NCIU) ordered its militant Youth Action Corps disbanded in March. By October, spokesmen for the leading labor federations promised that strikes would be used only as a last resort. Nevertheless, post-war Japanese labor organizations were a powerful influence; mid-year figures showed there were over 20,000 unions with over 5,000,000 members. The NCIU, patterned on the American CIO, counted 1,300,000 members.

Reform of the Japanese capital structure proceeded under the encouragement of SCAP. Final dissolution of the giant Zaibatsu (Financial Trusts) was accomplished. At the close of the year, the Diet passed three sets of laws amending the 1946 ordinance for the Holding Company Liquidation Commission; liquidating undue concentration of capital; and further regulating family affiliations in former Zaibatsu concerns. Kodan (Public Corporation) emergency measures provided transition from wartime Control Associations to peacetime economic rehabilitation. The 1947 finance law established an income tax on a pay-as-you-go, self-assessment basis, new to Japan.

REPARATIONS AND FOREIGN TRADE

The United States pressed for a speedy decision by the Far Eastern Commission on the problem of reparations. A policy statement by the FEC, dated May 8, ruled that reparations would be distributed among the Allies according to destruction incurred by Japanese aggression; and decided that removals would come out of both capital equipment and current production. But agreement on details was limited to interim removals, the criteria for plant selection, and the "broad political basis" of each country's shares. Meanwhile, impatient American officials seemed to be taking what they called a more realistic view of reparations. A modification of the original Pauley proposals was recommended in the less severe plan of an industrial mission headed by Clifford Strike, president of the F. H. McGraw Company. Meanwhile, advance transfers of reparations were begun, according to an interim policy established April 3.

From the Japanese view, the still confused reparations situation was balanced by the first post-war permit to engage in limited foreign trade. In 1946, the Far Eastern Commission had approved the establishment of the Inter-Allied Trade Board for Japan, an advisory body made up of representatives of the 11 Commission members. The Board met throughout the year in Washington, advised

SCAP on the disposition of exports from Japan, the choice of imports to Japan, and the reopening of private trade. On Aug. 15, a decision was reached whereby 400 Allied Trade Representatives were permitted to enter Japan. The American quota was 102. Finally, the Commission made possible the use of Japanese liquid assets in gold, silver, and jewels as a credit base to facilitate the import of raw materials. General MacArthur set up a revolving fund with initial assets of $137,000,000, but it had not yet been put to use at the end of the year. There was still no official rate of exchange set for the yen; a trade rate varied from commodity to commodity. The official conversion rate was altered from 15-1 to 50-1, yen to dollar.

PEACE TREATY

In several interviews during the year, especially the press conference of March 17, General MacArthur left no doubts as to his desire for negotiations leading to an end of the occupation, a peace treaty, and eventual supervision of Japan by the United Nations. Lake Success was generally cool to the latter proposal. On July 11, the United States proposed to the other Allies a preliminary conference of representatives of Far Eastern Commission members, held outside the FEC. The initial groundwork for a treaty would be prepared by deputies and experts, with a simple two-thirds majority ruling. The draft would then be approved by the Foreign Ministers of the 11 countries and submitted to all states at war with Japan.

All the countries approached by the United States, except the Soviet Union, approved the idea of a conference, though the British Commonwealth objected to the suggested date which conflicted with the Canberra meetings. Eight countries approved the voting procedure. The U.S.S.R. countered with a demand that the draft must first be approved by the United States, the Soviet Union, the United Kingdom, and China, represented in a Council of Foreign Ministers. The United States and the British Commonwealth in August rejected the veto procedure implied in the Soviet demand. China offered a compromise whereby the preliminary meeting would vote according to Far Eastern Commission procedure: a majority including the four main powers. Because of the Sino-Soviet Treaty of 1945, China hesitated to enter into separate negotiations with Japan without Russian approval. At the end of the year, the preliminary conference was yet to be summoned.

KOREA AND THE UN

Throughout the year, the United States continued to have responsibility for the military government of Korea south of 38° N. latitude. After July 1947, all directives pertaining to civil affairs and military government in South Korea flowed direct from the Joint Chiefs of Staff to Lt. Gen. John R. Hodge. Thus American policy for South Korea was developed in (1) the State-Army-Navy-Air Coordinating Committee (SANACC) and transmitted by the Army to (2) the Joint Chiefs of Staff, who prepared directives for (3) the Commanding General, U. S. Army Forces in Korea (CG USAFIK, General Hodge) who passed them on to (4) the U. S. Army Military Government in Korea (USAMGIK, Maj. Gen. William F. Dean). Under USAMGIK the Korean Interim Legislative Assembly (KILA), established in December 1946, continued to sit through the year with 45 elected and 45 appointed Korean delegates. By May 1947, the process of Koreanization had progressed to the stage where the administration was referred to as the South Korean Interim Government (SKIG). Meanwhile, contact with Russian-occupied North Korea was restricted to some exchange of electric power and a fair amount of black market smuggling.

On the assumption that there was some basis of agreement between the military governments of the two zones, the Joint Commission was reconvened in May, but final breakdown of bilateral negotiations came in September. Secretary of State Marshall determined to refer the whole problem of Korea to the UN Assembly, which put the question on its agenda on Sept. 23. The Soviet Union countered on Sept. 26 with a proposal for joint withdrawal of Russian and American troops from Korea. On Nov. 13, the General Assembly, by a vote of 43-0 and despite Soviet threats of a boycott, agreed to establish a commission to supervise elections in Korea and to help set up a provisional government.

THE UNITED STATES AND LATIN AMERICA

By Graham H. Stuart
Professor, Stanford University

HEMISPHERE DEFENSE

As the year 1947 opened the United States was faced with a number of major problems in the relations with Latin America. The principal question related to defense of the Western Hemisphere. The Act of Chapultepec signed at the Conference at Mexico City in 1945 needed implementation, and provision had been made to render the act effective by a conference on military cooperation to be held later in the year in Rio de Janeiro. However, owing to the recalcitrant attitude of Argentina, no conference has been held.

COMMUNISM AND TRADE

Another serious problem was the progress of Communism in Latin America. As relations with the Soviet Union steadily deteriorated, it became increasingly necessary to prevent infiltration of the Communistic doctrine in the Latin American republics. Mexico, Argentina, and Chile seemed to be focal points of the advance and these were all vital areas in any program for continental defense.

A third important problem concerned commerce and finance. Latin America, like all other parts of the world, had suffered a diminution of trade and industry with the end of the war, and, this coupled with inflation in costs of commodities, particularly in such basic requirements as food and shelter, furnished a fertile field for the propagation of the Communist dogma. Such a problem, although its implications were clearly international, nevertheless, in its immediate import, was national and as such could cause serious embarrassment to any third state which dared to interfere.

Even the machinery which was used to conduct relations with Latin America was not functioning smoothly. Spruille Braden, Assistant Secretary of State in charge of Latin American affairs, had antagonized certain business interests which possessed important senatorial support so that President Truman and Secretary of State Byrnes were in somewhat of a quandary as to just how far they could support the intransigence of Braden in his hostile attitude towards Argentina. The sudden resignation of Secretary of State Byrnes and the succession of General Marshall, whose interests have been centered largely in Europe and the Far East, did not help the situation.

RELATIONS WITH ARGENTINA

The first problem to be solved before any move towards hemispheric defense was possible required a better relationship with Argentina. The able career ambassador, George S. Messersmith, had been sent to Argentina to work out a suitable arrangement with the Peron Government, but Spruille Braden still remained Assistant Secretary of State in charge of Latin American affairs. Messersmith returned to Washington at the end of 1946 and reported that Argentina was making a real effort to eradicate Nazis and Nazi influences. Shortly after he went back to Buenos Aires, Messersmith was able to report that some 60 important German firms, including Bayer Chemical Co. and the electrical engineering establishment of Siemens-Schuckert, had been taken over by the Government. The assets of these establishments were valued at about $100,000,000. On Jan. 25, 1947, the Department of State approved this "welcome addition to the measures already taken in respect of Nazi education and other institutions."

Unquestionably Messersmith's policy of the velvet glove was succeeding, but, with the advent of a new Secretary of State, the influences supporting Braden, headed by Under Secretary of State Dean Acheson, finally forced the resignation of Messersmith. However, Secretary Marshall wanted above all an inter-American treaty of mutual assistance, so Braden's resignation also was arranged, and the new ambassador, James Bruce, a purely political appointee, was instructed to carry out the policy of cooperation with the Peron régime. Early in June an announcement by President Truman that Argentina had fulfilled the obligations which it had accepted at the Conference of Chapultepec made it clear that the United States felt ready to proceed with the conference for continental security.

Meanwhile President Truman urged Congress to pass the Inter-American Military Cooperation Act which was designed to bring about standardization of military equipment and training in all the republics of the Western Hemisphere. Under the provisions of this bill, the President is authorized to transfer equipment in the amount he deems suitable to those Latin American countries requesting it. In return, he may accept in full or partial payment the arms and equipment of European origin which the countries have hitherto been using. The bill further permits the maintenance of United States military and naval training missions in the Latin American states and also to bring officers from those countries for advanced training in the United States. The principal advantages of the bill were twofold: Latin American countries would better protect themselves against a European attack and it would eliminate the European military missions so prevalent in Latin America before the Second World War.

When Congress failed to pass the law for Inter-American Military Cooperation, the Departments of War and Navy went ahead with the approval of Secretary of State Marshall and furnished large amounts of surplus military equipment including fighters, bombers, and armored cars to all of the Latin American republics except Argentina, Dominican Republic, Honduras, and Nicaragua. Although the sales value as surplus was only $5,000,000, the original cost was over $37,000,000. This, added to the $400,000,000 worth of combat supplies furnished under lend-lease distribution during the war, was a good start upon the program advocated by the administration.

INTER-AMERICAN CONFERENCE OF FOREIGN MINISTERS

The Foreign Ministers of the American Republics designated Aug. 15, 1947 as the date for the conference to negotiate the treaty for mutual defense recommended by the Act of Chapultepec. The place selected was the Hotel Quintadinha (little fruit stand) near Petropolis about 50 miles from Rio de Janeiro. The importance attached to this conference by the United States was shown by the fact that President Truman agreed to address the closing session. The United States delegation headed by Secretary of State Marshall included Senator Vandenberg, Chairman of the Senate Committee on Foreign Relations, Senator Connolly, ranking Democratic member of the Committee, and Warren R. Austin, United States representative to the United Nations. All of the Latin American Republics were represented at the conference except Nicaragua whose government, set up by a military coup by former President Somoza, had not been recognized. Over 250 delegates and advisors from 20 American republics attended the conference.

The Cuban delegation to the conference made a vigorous effort to include hemispheric economic problems but the steering committee decided to limit discussions to drafting the treaty of mutual defense. However, it was agreed that Pan-American economic problems should be considered at a special conference later in 1947 or be reserved for the regular Inter-American Conference scheduled for Bogota in 1948. Nevertheless, the Mexican Foreign Minister, Jaime Torres Bodet, received an ovation when, on the first day of the conference, he declared that "one of the deepest yearnings of this continent is to develop the economic cooperation of our countries so that many of them shall not become merely armored invalids iron-clad for emergencies, but communities strong through production and the equitable exploitation of their resources."

Approximately 150 proposals for the treaty provisions were submitted, in addition to the numerous amendments and changes suggested during the conference. The Argentine proposal provided for force against aggressors from outside this hemisphere, but only pacific means were to be used against aggressors from within. The United States insisted strongly that all aggressors should be met by force if necessary, and Argentina finally withdrew from her position. Limited to but one subject, this conference completed its work in less than three weeks, closing Sept. 2. President Truman addressed the conference briefly during the last week of the sessions and explained why Europe took precedence over Latin America in financial assistance from the United States at the present time. The conference was an unqualified success, and the treaty which resulted from it in the words of Ambassador Austin "strengthened the spiritual bonds between these neighboring countries by formalizing them in the letter of a great covenant."

INTER-AMERICAN TREATY OF RECIPROCAL ASSISTANCE

The Treaty of Reciprocal Assistance signed at Rio de Janeiro Sept. 2, 1947 consisted of a lengthy preamble and 26 short articles. A reservation was attached to the treaty by Honduras as regards aggression across the boundary established between Honduras and Nicaragua. The basic provision of the preamble states that "the obligation of mutual assistance and common defense of the American Republics is essentially related to their democratic ideals and to their will to cooperate permanently in the fulfilment . . . of a policy of peace." Articles 1 and 2 condemn war and provide for the submission of all disputes to peaceful settlement by procedures in force in this Inter-American System before referring them to the United Nations. Articles 3 through 5 provide that an attack against any American state is an attack against all, and each undertakes to assist the state attacked individually and collectively until the Security Council of the United Nations takes measures to maintain security. Article 6 permits the Organ of Consultation to act in any situation which might threaten the peace of the Americas, and Article 7 prescribes the procedure for peaceful settlement in case of a conflict between two or more American states. Article 8 prescribes the sanctions which may be employed beginning with suspension of diplomatic relations and ending with the use of force, and Article 9 defines aggression as unprovoked attacks or armed invasion. Articles 10 through 16 provide that no provisions of the treaty impair obligations under the United Nations Charter and give the Conference of Ministers and the Governing Board of the Pan American Union jurisdiction over consultation procedure. Articles 17 and 18 require the Organ of Consultation to decide by a two-thirds majority excluding the parties directly interested. The remaining articles govern procedure in meetings and make the treaty binding after two-thirds of the signatory states have ratified it.

The Treaty goes even further than the Act of Chapultepec in its provisions to safeguard the security of the Western Hemisphere in as much as it makes a distinction between various forms of aggression. The power to act upon a two-thirds vote is a long step forward in making international cooperation effective. The Treaty is wholly consistent with the Charter of the United Nations and harmonizes with regional and world security systems. All of the 20 republics represented at Rio signed except Ecuador whose government was overthrown during the conference. Secretary Marshall, speaking on Sept. 4, suggested that "the successful formulation of this regional treaty affords the United Nations an example . . . of which it is in great need at this time," and Senator Vandenberg noted on the same day that "there is no paralyzing veto upon any of these peaceful sanctions."

PROPOSED MARSHALL PLAN FOR LATIN AMERICA

One reason for the desire of the Latin American states to bring financial and economic questions before the Rio Conference was the dollar shortage which was slowing down their foreign trade. All Latin American countries needed the products of United States industry, farm machinery and business machines particularly. In the first three months of 1947, Latin America purchased goods valued at almost $1,000,000,000 as against less than $500,000,000 in all 1938, but as dollars became scarcer and prices in the United States rose Latin Americans could purchase less. The Marshall Plan, which looked entirely towards Europe, betokened an even more serious situation for Latin America. A certain degree of resentment was felt at the apparent intention of the United States to channel its equipment, particularly factory machinery and farm implements, to Europe instead of southward. United States investments of private capital were on the increase, particularly in the development of natural resources such as oil in Venezuela, but the Latin Americans preferred the lend-lease method or Export Import Bank Loans which permitted national control in developing their industries.

As evidence of this trend, Colombia proposed that the United States formulate a "Little Marshall Plan" for Latin America whereby the United States Government would lend $5,000,000,000 to a corporation in which all of the 21 American republics would be represented. The primary purpose of this agency would be to lend money for projects which would increase production in Latin America. According to the Colombian statesman, Dr. Eduardo Santos, what the peoples of Latin America needed was not "cannon and tanks, large dangerous armies and war planes but education, health, and well being, and the opportunity to struggle for existence."

A concrete illustration of the crying need for capital is seen in the Mexican government oil monopoly. The Mexican oil fields, which once produced almost 200,000,000 barrels annually, have averaged under 50,000,000 barrels since the government took over in 1939. The industry needs to explore for new fields, it must build new refineries and pipe lines, and it must renovate its whole organization. Over $300,000,000 are needed, and after its previous experience foreign private capital is hesitant to enter. The Export Import Bank will probably help some as will also the International Bank, but to do all that is required a Marshall Plan would be the best solution from the Latin American point of view.

THE MENACE OF COMMUNISM

The spread of Communism in Latin America in the early part of 1947 was a very serious threat both to the maintenance of the Good Neighbor Policy and to the development of an effective program for continental security. In Mexico, Vincente Lombardo Toledano, head of the Confederation of Latin American workers, although he claimed not to be a Communist, hewed closely to the party line. In Cuba, Communist Lázaro Peña dominated the Confederation of Labor and Senator Juan Marinello was president of the Communist Party. In Chile, Leftist President Gabriel Gonzalez Videla, elected with the aid of the Communists, gave three posts in his Cabinet to members of the Communist Party. In Brazil, Luis Carlos Prestes claimed 130,000 Communist followers, one-tenth of the total voting strength of the country. The watchword of all these Communist elements was "Abajo Yanqui Imperialismo."

Chile took the lead in meeting the menace head on. Simultaneously with the reestablishment of the Comintern or Cominform in Poland early in October, a serious strike took place in the coal mines of Chile. President Videla had been suspicious of the Communists and had put his secret police on the trail of the Yugoslav diplomats, the suspected ring leaders. Claiming that the Reds were menacing the continental defense policy, Videla expelled the Yugoslav diplomats, broke off diplomatic relations with Yugoslavia, and followed this by severing relations with Russia and Czechoslovakia. Communists were rounded up, their newspaper suspended, and Videla threatened to outlaw the party.

Brazil acted with equal speed and effectiveness. President Dutra, in the spring of 1947, had outlawed the Communist Party. When, early in October, the Russian newspaper *Izvestia* made certain slurring remarks on Dutra and when the Soviet Foreign Office did not deign to answer the demand for an apology, the Brazilian Foreign Minister brusquely handed his passports to the Russian ambassador and severed diplomatic relations. The Department of State and United States investors looked with sympathetic eyes at the gradual weakening of the power of the Communists with the hoped for possibility that Argentina might soon follow along the same path.

INFECTED CATTLE CRISIS IN MEXICO

The United States has become seriously alarmed at the rapid spread of the hoof and mouth disease in the livestock herds in Mexico. If not brought under control, it is a very serious threat to the vast cattle herds of the United States in Texas. Although at present the infected areas are in south central Mexico—it began in the province of Vera Cruz—it has spread as far west as the Federal District and as far north as Aguascalientes. The infected area includes about 2,000,000 head of cattle, 30 per cent of all cattle in Mexico, 1,400,000 sheep, 43 per cent of the sheep, and equivalent numbers of hogs and goats. The United States Government has spent about $35,000,000 in aiding the Mexican Government to slaughter the cattle and bury them in lime pits.

The Mexican farmers have resented this destruction of their herds and have upon occasion murdered the officials sent to carry out the stringent orders. After about 500,000 cattle had been shot and buried and thousands of exposed but uninfected cattle sent to market, the opposition became so strong that the United States and Mexico agreed to stop slaughtering and depend upon quarantine and vaccination. Cattlemen in the United States were very dubious of the new policy and feared that the dread disease might enter the United States.

UNITED STATES AND DEFENSE BASES IN PANAMA

After the United States entered the Second World War, it was found advisable to strengthen the defenses of the Panama Canal by the addition of a number of air bases in Panamanian territory. Panama declared war on Japan the day after Pearl Harbor, and on May 18, 1942 signed an agreement with the United States permitting the use by the armed forces of the United States of numerous defense areas in the republic outside the Canal Zone.

The largest of these was the Rio Hato air base situated about 80 miles southwest of the Canal, for which the United States was to pay an annual rental of 10,000 balboas. As the war progressed, numerous other bases were established until the United States had constructed some 134 defense sites in Panama to protect the Canal.

The agreement with the Panamanian Government provided that all lands taken over were to be evacuated one year after the definite treaty of peace had been signed. It was not expected that peace would be delayed so long after military action ceased, and although the United States withdrew gradually from most of the bases, it was felt that the world situation demanded the retention of 14 of these bases, including the bomber base at Rio Hato, for at least ten years longer. After discussing the matter for about a year, a treaty was finally signed Dec. 10, 1947 by the terms of which Panama agreed to lease the Rio Hato base to the United States for a period of ten years with the privilege of a ten-year renewal period, and the other sites, principally technical installations, for a period of five years.

Although adequate compensation was to be paid for the use of the sites, strong opposition developed to the agreement, particularly among the students of the University. The Panamanian Foreign Minister resigned in protest at the terms, and it was soon evident that the treaty might have difficulty in getting the approval of the Legislative Assembly. President Enrique Adolfo Jimenez assured U. S. Ambassador Frank Hines that he had the necessary votes to secure the adoption of the treaty, but nationalistic feeling, stimulated by Communist abetting, became so aroused that the National Assembly refused to approve the treaty by a unanimous vote cast Dec. 22. Former Foreign Minister Alfaro, who had resigned rather than sign, declared that the rejection of the pact was due to a reaffirmation of Panama's national sentiment. Immediately following the rejection, orders were given by the United States to evacuate all the bases immediately. As the year ended, it was felt that sober second thoughts might change the Panamanian attitude. The suggestion raised in Congress that the United States take steps immediately to consider the construction of a sea-level canal through Nicaragua may help the Panamanians to reconsider their summary rejection.

SOCIAL, TECHNICAL, AND EDUCATIONAL COOPERATION

A considerable increase took place during the fiscal year 1946-47 in the exchange of cultural and technical services between the American republics. The Interdepartmental Committee on Scientific and Cultural Cooperation served as the mechanism for utilizing the resources of the United States Government in promoting social and economic welfare and cultural interchange among the 21 American republics. During the year, 249 professors, teachers, and specialists in various technical and cultural fields were exchanged between the United States and the other American republics; 162 United States technicians were stationed in the other republics; and 327 Latin Americans were being trained in the United States in preparation for working in some branch of their own government. During the same period 308 students from the American republics were studying in the universities or industrial plants of the United States.

In the field of agriculture alone, 158 officials and specialists came to the United States from 18 of the other American republics on special governmental or private missions seeking experience to be applied in their official or professional jobs. Six full-time specialists from the United States were stationed in the agricultural station of Tingo Maria, in central Peru, in 1947.

By October, 1947, there were 29 cultural centers in the Latin American Republics receiving support from the U. S. Department of State, and it is planned that, by June 30, 1948, these United States-oriented cultural centers will be found in every Latin American capital except San Salvador. English language instruction in the centers reached the following number of students: Buenos Aires, 4,000; São Paulo, 3,500; Mexico City, 2,500; Rio de Janeiro, 2,000; and Lima, 1,500. In 1947, the Congress of the United States appropriated $584,868 to assist in the form of American personnel, materials, and small grants of cash to defray operating deficits of these centers. It seemed evident that cultural cooperation would march side by side with cooperation for continental security.

THE UNITED STATES AND THE MIDDLE EAST

By Grant S. McClellan
Research Associate, Foreign Policy Association

GENERAL

United States aid to Greece and Turkey and active American participation in the United Nation's decision to partition Palestine represent the two outstanding developments of Middle East-American relations in 1947. Both the Greek-Turkish aid program and approval of division in the Holy Land also represent significant new landmarks in American policy toward the eastern Mediterranean area. As British power was withdrawn from Greece, the United States succeeded to the task of bolstering that nation's economy and aiding in its defense. Likewise, the United States, and to a lesser extent the U.S.S.R., inherited Britain's responsibilities in attempting to reach a settlement between rival Jewish and Arab claimants for Palestine.

YEAR OF DECISION

As the year ended, however, it was too early to predict what the outcome of temporary American aid for Greece and Turkey would mean in terms of a new power alignment in the Near East. Despite the fact that partition for Palestine was voted by the General Assembly of the UN on Nov. 29, the year closed with much speculation also whether the decision would lead to peace between the two opposing nationalist forces on the spot or to conflict between Washington and Moscow when the time came to implement the plan. But because of what might follow in its wake, 1947 may well become known as the "year of decision" in Middle East-American relations. For just as American aid to Greece led to deep involvement in internal politics in that country, which in turn raised the fear of counter measures on the part of Russia or its satellites in southeast Europe, so too any thought of direct military action in Palestine in setting up the two new states raised the issue of what might follow throughout the Arab lands should American and Russian forces be employed in the heart of the Moslem world.

UNITED STATES INTERESTS BROADENED

Elsewhere in the Near East the countries stretching from Cairo to the borders of the newly formed British Dominions in the subcontinent of India experienced the third year of postwar reconstruction with little to show toward real stabilization either economically or politically. In Turkey, the emergence of a Democratic Party to offset the single state party gave but little hope that the Ankara régime was soon to become a model of democracy. American aid to Ankara, unlike that for Greece, was granted solely for the purpose of helping expand the military forces of the nation, but it was doubtful that the $100,000,000 so granted would effectively relieve the economic burden of Turkey, a state where army, navy, and air force expenditures accounted for so large a portion of the national budget. What the aid program for Turkey implied above all, of course, was that America's security interests extended to the Dardanelles. The problem of the Turkish Straits, however, was brought no nearer settlement during the year than in 1946.

Keen American interest continued in 1947 in the oil reserves of the Near East, but few new developments were announced in this regard. Contracts were given to a group of five American engineering companies, as announced on Feb. 23, for construction of a $100,000,000 Saudi Arabian pipeline to the sea. The American construction company of Morrison-Knudsen, on the other hand, was employed during the year to build dams, irrigation, and power projects in the strategic country of Afghanistan. Washington also maintained active official interest in Iranian affairs during the year. The high point of that concern was expressed by our Ambassador, George V. Allen, on Sept. 11, when he indicated that the United States would support Iran's independence. Pledging aid if Iran did not yield its sovereignty with respect to Russian demands for entry into Iranian oil developments, Allen said: "The United States has no proper concern with proposals of a commercial or any other nature made to Iran by any foreign government as long as those proposals are advanced solely on their merits, to stand or fall on their value to Iran. We and every other nation in the world, however, do become concerned when such proposals are accompanied by threats of bitter enmity or by a statement that it would be dangerous for Iran to refuse. . . . Patriotic Iranians, when considering matters affecting their national interest, may therefore rest assured that the American people will support fully their freedom to make their own choice."

UNITED STATES IN GREECE

American concern about Iran was overshadowed, however, by the more dramatic events involving Greece. Enunciation of the Truman Doctrine on March 12, 1947, when aid for Greece and Turkey was first proposed, as well as the United States stand on Iran, clearly showed that the Near East was an area that Washington believed could be kept free of Soviet domination. Thus the policy of containing the Soviet Union as prescribed in the Truman Doctrine saw its most concrete manifestation in the area of Russia's historic search for warm water outlets in the south. The Middle East—the ancient bridge between the East and West—again became in 1947 the locale for rivalry between great powers lying outside the area.

The British government, which for so long had been the dominant foreign power in Greek affairs, suddenly announced Feb. 24 that it could not afford economic and financial support for Greece and Turkey after March 31, and that the 10,000 British troops in Greece would soon be withdrawn. Within three weeks thereafter, on March 12, President Truman delivered before the Senate and House of Representatives his message calling for aid to Greece both to assist in economic reconstruction and to prevent the spread of communism in the Aegean region. More broadly the President declared, "totalitarian régimes imposed on free peoples undermine the foundations of international peace and hence the security of the United States." This policy was embodied in law May 22 when $300,000,000 for Greece and $100,000,000 for Turkey were appropriated by Congress. Of the amount for Greece, $150,000,000 was originally designated for economic aid, and half the total was to be used for military purposes. By the year's end, however, it became clear that more of the funds were needed for military expenses, and the original grant would have to be supplemented by other funds in the years ahead.

Dwight P. Griswold, former Governor of Nebraska, was chosen to administer on the spot the funds provided by Congress. While his mission and the military personnel involved were to have advisory functions only, it soon became apparent that detailed questions of public policy in Athens would have to be settled by that group if American aid was to be of real benefit. As the two governments had previously agreed, Griswold and his staff were soon advising the Athens régime on finances, trade, and the inflationary crisis. Major changes in the Greek tax system were suggested, reform in the civil service was urged, and new policies on foreign trade, labor, and agriculture were outlined.

United States aid was not offered on a blank-check basis, for the Greek government agreed that military and economic assistance was conditional upon proof of immediate intention to institute the necessary reforms. No political requirements were laid down by Washington, and intervention in Greek internal politics was avoided, although the line of demarcation between what was primarily an internal Greek political matter and a situation which called for United States concern became progressively less clear cut.

Help in the country's economic restoration was recognized as the most important task which confronted the Americans in Athens. That this would be so had been made clear by Paul Porter, chief of the American Economic Mission which studied conditions in Greece during the first three months of 1947. He reported that the nation's economy had recovered little since the Nazi occupation. Important as economic recovery appeared, the last months of 1947 saw the emergence again of civil war as Greece's chief threat, and combatting guerrilla warfare in the north came to be the most pressing issue the Griswold group confronted.

U. S. SUPPORT FOR GREECE IN THE UN

That a "Free Greek Government" was to be established in the north was first hinted in the early autumn. A later announcement Dec. 24 indicated that the rebel régime was headed by Markos Vafiades. Athens immediately prepared to counter the rise of this communist group, but for Washington and for Americans on the spot this development brought to a head two problems that faced this country from the outset of its active interest in Greece. First, Washington's support of the Rightist coalition government in Athens was again in dispute. By December, however, no new policy in this regard had been announced. How to deal most effectively with the guerrilla activities in the north—the second problem—was one that Washington wrestled with during the entire year.

When, in December 1946, Greece first brought charges in the UN against its northern neighbors for interference in Greek affairs, the United States immediately proposed that a UN fact-finding commission be sent to the border region. To this suggestion the Soviet Union agreed. The commission was subsequently established and Mark F. Etheridge, publisher of the *Louisville Courier*, headed the American delegation. The Balkan Commission's work, however, was impeded by a rift that soon developed between the liaison representatives of Yugoslavia, Albania, and Bulgaria, and the Russian and Polish delegates on the one hand, and the nine other members of the group and the Greek representative on the other. No unanimous report eventuated from the Commission's work, but the majority statement, presented to the Security Council June 27, was a serious indictment of the three Slavic states on Greece's border.

From that time, cooperation between the Soviet bloc in the UN and the western powers broke down. Russia vetoed in the Security Council July 29 the American proposal that that body establish a semipermanent commission to keep watch on the Greek border, but a similar Balkan Commission of the UN's General Assembly (where the Soviet Union's objections did not constitute a veto) was later appointed. Its duty was to keep watch along the Greek side of the northern border, yet its only real power was to observe and report violations of international law. By the year's end, however, its many surveys showed that guerrillas ranging in numbers from less than a score to several hundred had escaped across the border, were aided there and supplied with arms, and then escorted back to Greece in military formations.

The UN General Assembly, in its autumn session in New York, again discussed the Greek case. Again the United States sought to strengthen the UN's action on the Greek border disturbances. Most forthright of all United States pronouncements on the issue, however, came after the establishment of the "Free Greek Government" in the northern border area. On Dec. 30, Under Secretary of State Robert A. Lovett warned that recognition by any countries of the so-called provisional government in northern Greece would have serious implications, that it would be an open disregard of the United Nations resolution setting up the Greek Border commission, and clearly contrary to the principles of the UN Charter.

AMERICAN POLICY ON PALESTINE

If United States-Russian differences regarding Greece mounted throughout the year 1947, these two countries found that Palestine offered a point of temporary agreement. How long the cooperation between Washington and Moscow might last was not known. As indicated above, if outside military force should be required in the future to establish the Jewish and Arab states, then friction could easily ensue between the two great power capitals on this issue. Terror again struck in the Holy Land after the UN decision Nov. 29 and continued for the next month. It was this fact especially which led observers to question United States and Russian ability to work together amicably in the coming year as they had in voting for partition.

As had been true for so many previous years, Palestine was a question of international importance from the very beginning of 1947. Not until the breakdown of separate conversations with Arab and Zionist spokesmen in January and February, however, did the British government decide to submit the question to the UN. On Feb. 14, after an unsuccessful effort to reach agreement on a British proposed partition plan, Foreign Secretary Bevin announced that the Attlee government would take the Palestine issue to the UN. The partition plan presented by that government in the above parleys had called for two semi-autonomous Arab and Jewish areas, subject to over-all authority of the British government, and a proviso that the problem would be submitted to the UN at the end of five years if it still remained unsolved.

SPECIAL UN SESSION

Continued tension in Palestine during the following months led Britain April 2 to request the Secretary-General of the UN to call a special session of the General Assembly to consider Palestine. More specifically, Britain asked that the Special Assembly be called to constitute and instruct a special committee on Palestine to prepare a report for the regular autumn session of the UN General Assembly. By April 13, a majority of the nations signified concurrence on the British proposal, and on April 28 the special session opened in New York. The chief issue at stake during this session was the technical one of defining the composition and competence of the special committee. When the Assembly's deliberations were ended May 15, a commission had been chosen of smaller neutral nations for the task of investigating all issues relevant to Palestine. In the hearings and discussions held between April 28 and May 15 the Great Powers, except the United States, also revealed the attitude each government subsequently adopted with respect to the substantive question of partition.

On May 29 in Britain, Foreign Secretary Bevin stated that he personally would not feel bound by a UN decision regarding Palestine unless it was unanimous. This approach was to characterize many British statements in the autumn Assembly session and in London's attitude after partition was finally approved. Because the position of the U.S.S.R. had never been divulged before, the Soviet delegate's statement on May 14 was more revealing. He declared, if a unitary state for both Jews and Arabs could not be agreed upon for Palestine, then Russia would consider an alternative plan of separate states in the Holy Land.

The United Nations Special Commission on Palestine (UNSCOP) took up its work in June and completed what was, in effect, three reports in one on Aug. 31. Despite the difficulties first faced by the committee caused by an Arab boycott, its final recommendations were broad in scope, governing the situation of Jewish refugees in Europe, proposals on dividing the Holy Land, and recommendations for further UN supervision. The three reports in one consisted of a majority statement favoring outright partition, a minority federation plan, and a list of certain general principles, unanimously agreed to, which all members felt should be followed in any settlement.

UNSCOP REPORT AND PARTITION

The most outstanding general principles adopted by UNSCOP were as follows. The British mandate should be terminated and independence granted at the earliest practicable date. During the transitional period, the authority in charge in Palestine should be responsible to the UN. Safeguards were suggested for the preservation of holy places, and it was accepted as a cardinal principle that economic unity for the entire area be established under any settlement. The new state or states in Palestine were required to be democratic in character and fully prepared to cooperate with the UN. The special committee also urged the General Assembly promptly to take the initiative in dealing with the approximately 250,000 displaced Jews in Europe. However, in one general recommendation, with two dissenting votes, the committee stated that "it should be accepted as incontrovertible that any solution for Palestine can not be considered as a solution of the Jewish problem in general."

The majority statement on partition was supported by Canada, Czechoslovakia, Guatemala, Holland, Peru, Sweden, and Uruguay. Australia did not vote for either plan. The partition scheme embodied the above general principles through the proposals to create two independent states after Sept. 1, 1949, and provided for the eventual establishment of an economic union for the whole of Palestine. In addition, the majority plan called for the early entry of 150,000 Jewish refugees into the Jewish state, and a separate international district for the city of Jerusalem and its environs. The minority members of the commission—Iran, India, and Yugoslavia—suggested a federal state in Palestine, with a common citizenship and nationality, and a central capital in Jerusalem. In this case, the federal government would have full control of defense, foreign relations, immigration, currency, federal taxation, patents, copyrights, and interstate commerce. Local powers, comparable to those of American state governments, would have been entrusted to the two members of the federation—the Arab and Jewish states. Had this binational federal plan been adopted, less territory would have been turned over to the Jewish state than if two wholly independent units had been created. Under the majority plan of UNSCOP, the new Jewish state would have had a population at the outset of about 500,000 Jews and 416,000 Arabs. Its area would constitute about 60 per cent of Palestine. Arabs would have numbered about 715,000 in the Arab state, and there would be about 8,000 Jews as well. The international district of Jerusalem would have contained approximately 106,000 Arabs and 100,000 Jews.

As finally adopted by the General Assembly Nov. 29, partition for Palestine closely followed the majority report of UNSCOP. With ten states abstaining and Siam absent, partition was approved by the unexpectedly large majority of 33 to 13. The Assembly's decision thus forshadowed the creation of three new political units in the Holy Land: an independent Jewish state of 5,500 square miles inhabited by 538,000 Jews and 397,000 Arabs; an independent Arab state of 4,500 miles containing 804,000 Arabs and 10,000 Jews; and a UN trusteeship territory in the 289 square mile enclave of Jerusalem for 105,000 Arabs and 100,000 Jews. Because the final plan adopted by the General Assembly excluded the Arab port of Jaffa from the Jewish state, the population figures given in the UNSCOP report were altered. During a transition period which is to end by Oct. 1, 1948, the partition plan will be administered, "under the guidance of the Security Council," by a five-member UN commission comprised of Bolivia, Czechoslovakia, Denmark, Panama, and the Philippines. The three parts of Palestine are to form an economic union, and the Jewish and Arab states are to have armed militia to maintain internal order and prevent frontier clashes. Provision was made for democratic institutions and protection of minorities.

At first it was decided that British troops were to be withdrawn and the British mandate terminated by May 15. Since the Assembly's action, however, London has announced that it will withdraw from Palestine at an even earlier date. This action and the decision of the Arab League, which announced that it completely rejected the partition scheme on the date of its acceptance by the UN, served to complicate anew the peaceful implementation of a settlement. Arab threats that Moslems would fight to the death rather than allow a Jewish state to rise in Palestine were discounted as more bluff than realistic policy by most members of the United Nations. Yet, as the year ended, it was far from certain that the great powers could agree on a plan for transferring power in the Holy Land, thus establishing the two new states as independent political units by Oct. 1, 1948 as proposed by the UN Assembly.

FOREIGN SERVICE OF THE UNITED STATES

By C. M. Ravndal

Director General of the Foreign Service, State Department

THE FOREIGN SERVICE ACT OF 1946

The Foreign Service of the United States underwent a fundamental reorganization as a result of the passage, by the Seventy-Ninth Congress, of the Foreign Service Act of 1946. This act, which is the basic legislation for the Foreign Service as it operates today, represents a great advance from the point of view both of personnel management and administration.

It gathered together all previous legislation in one basic charter. It set up five basic groups of personnel: Ambassadors and Ministers, Foreign Service Officers, Foreign Service Reserve Officers, Foreign Service Staff Officers and employees, and alien personnel. This was a very important step, for the structure of the Foreign Service, through the addition over a period of years of various small categories, had become complex and difficult to administer.

The act also set up a new pay scale, bringing up to date pay scales some of which had previously been set up in 1855. The legislation also provided authority for the payment of needed allowances for Foreign Service personnel living abroad, in addition to the already existing representation and cost of living allowances. The new allowances included a transfer allowance, a maintenance allowance for residences of principal officers abroad, and the authority to reimburse expenses resulting from illness or injury incurred in line of duty.

In order to provide for a more highly trained Foreign Service, the act established a Foreign Service Institute which, like the Army and Navy Staff Colleges, will train Foreign Service personnel progressively through their careers. The act also provided that personnel should receive home leave after two years abroad, as compared with the former requirement of three years, and specified that three of the first 15 years of service of each Foreign Service Officer must be spent in the United States.

In addition the new legislation set up a promotion-up and selection-out procedure by which it was hoped to keep Foreign Service officers developing continuously and to prevent the accumulation of personnel who had passed their peak of performance.

DUTIES OF THE FOREIGN SERVICE

The Foreign Service of the United States on December 31, 1947, numbered approximately 11,000 persons including ambassadors, ministers, Foreign Service officers, Foreign Service Reserve officers, Foreign Service staff officers and employees, alien clerks and employees, and consular agents.

The officers and employees of the Foreign Service protect the interests of the United States in accordance with treaties and international law, and advise, protect, and assist American citizens resident, traveling, or having interests abroad. They seek to prevent or to correct practices which might discriminate against the United States or its citizens.

They negotiate treaties, conventions, and protocols regarding international intercourse, tariffs, shipping, commerce, and the preservation of the peace in accordance with the instructions of the Secretary of State and the President. They observe, analyze, and report on significant political, social, and economic conditions and trends in the country to which they are assigned. Since an important function of the Foreign Service is the promotion and protection of the foreign trade of the United States, trade inquiries, trade disputes and market conditions are the subject of numerous communications.

AMBASSADORS AND MINISTERS

Ambassadors and ministers are appointed by the President by and with the advice and consent of the Senate, some being career members of the Foreign Service and others appointed from private life. In January, 1948, about 52 per cent of the ambassadors and ministers were appointed from the career Foreign Service.

Historically, embassies headed by ambassadors were maintained in the larger foreign countries and legations, headed by ministers, in smaller countries. In recent years, however, the United States has maintained embassies in all the other American republics and in some of the smaller countries abroad, so that the size or importance of a country no longer necessarily determines whether the chief of a mission is an ambassador or a minister.

Ambassadors and ministers receive salaries in four classes depending upon the salary classification of the post to which they are assigned. These classes are $25,000, $20,000, $17,500, and $15,000. In addition they receive allowances which vary from post to post and from year to year depending on conditions in the particular country and on the availability of funds.

FOREIGN SERVICE OFFICERS

Foreign Service officers are appointed by the President, by and with the advice and consent of the Senate. Normally candidates take both written and oral examinations, and upon successfully passing these examinations are placed upon the eligible list from which the President makes nominations to the Senate. Under certain circumstances individuals may be appointed Foreign Service officers after serving specific periods of time in either the Department of State or in other branches of the Foreign Service.

Foreign Service officers are commissioned both as diplomatic and consular officers and, aside from those who may be Chiefs of Mission (Ministers or Ambassadors), hold the titles

DIPLOMATIC PERSONNEL

Ambassadors

	Accredited by United States	Accredited to United States
Argentina	James Bruce	Señor Dr. Don Oscar Ivanissevich
Australia	Robert H. Butler	Mr. Norman J. O. Makin
Belgium	Admiral Alan G. Kirk	Baron Silvercruys

Yemen	J. Rives Childs	———

of Minister,* Counselor, First, Second, and Third Secretary, Consul General, Consul or Vice Consul, according to their rank and the posts they occupy. It is usual for officers to have both consular and diplomatic titles simultaneously if they are assigned to an embassy or legation.

Except for officers who qualify for appointment after serving abroad either in the Reserve or Staff branches or in the Department of State, all Foreign Service officers start in Class 6, the lowest class. Salaries range from a minimum of $3,300 in Class 6, to a $13,500 maximum in Class 1 and the Class of Career Minister. Depending upon the post and its duties, Foreign Service officers serving overseas may receive, in addition to their pay, allowances for rent, cost of living, and representation. Promotion is determined on the basis of merit with a certain time in grade required in each class. Foreign Service officers are expected to progress through the grades, and a "promotion-up or selection-out" system is now in effect which automatically retires officers who fail to win promotion within a stipulated number of years. The age of retirement is normally 60, and upon retirement an officer is provided with an annuity, out of an annuity fund toward which he has contributed 5 per cent of his salary.

During an officer's career in the Service he is expected to serve where he is needed in positions for which he is deemed best qualified. Officers are utilized interchangeably in consulates, diplomatic missions, and in the Department of State and other departments and agencies of the Federal Government, and are normally moved from one post to another and from one position to another every few years.

FOREIGN SERVICE RESERVE OFFICERS

Foreign Service Reserve officers are appointed by the Secretary of State for non-consecutive periods of not more than four years each. They may be assigned from other government agencies or from private life, and are appointed to any one of the six classes of Foreign Service officers appropriate to their age, qualifications and experience. They must have outstanding qualifications of a specialized nature. Normally they specialize in economic, cultural, agricultural or other types of work requiring experience and special training.

---

* Certain senior Foreign Service officers are appointed to the class of Career Minister when their duties are such as to be comparable in importance with those of an ambassador or minister. Examples are the second ranking officer at the American Embassy in London, the Consul General in Shanghai, and the directors of certain offices in the Department of State, all of which hold the rank of minister.

Included in this category at the present time are a number of public affairs, cultural relations, and information officers. These officers may hold diplomatic titles such as Counselor, First, Second or Third Secretary or Attache, and handle their particular specialized-work for their respective chiefs of mission.

FOREIGN SERVICE STAFF OFFICERS AND EMPLOYEES

Foreign Service staff officers and employees include all American personnel other than Foreign Service officers and Foreign Service Reserve officers. They are appointed by the Secretary of State without special examination, appointments being based upon age, qualifications and experience. This group includes administrative officers and assistants, disbursing and accounting personnel, clerks, receptionists, code clerks, file clerks, guards, couriers and translators.

Members of the staff corps receive annual salaries according to a scale of 22 classes with a top of $10,000 and a bottom of $720. The usual starting pay of clerical personnel is $2,160 in Class 14. Staff corps members receive the same privileges as Foreign Service officers, and also receive certain allowances depending on their duties and the conditions at the post to which they are assigned.

ALIEN CLERKS AND EMPLOYEES

Alien clerks are appointed in the field, and salaries are determined by the local rates prevailing. The category includes clerks, translators, interpreters, custodians, messengers, chauffeurs, porters, doormen, guards, janitors and charwomen, electricians, telephone operators, gardeners, watchmen and maintenance men.

ADMINISTRATION OF THE FOREIGN SERVICE

The Foreign Service is administered by the Director General of the Foreign Service who is appointed by the Secretary of State from among Foreign Service officers in the Class of Career Minister or Class 1. He is assisted by a Deputy Director General, and the Office of the Foreign Service, a part of the Department of State. Within the Office of the Foreign Service there are six divisions: The Division of Foreign Service Personnel, the Division of Foreign Service Administration, the Division of Foreign Service Planning, the Division of Foreign Service Reporting, the Foreign Service Institute, and the Division of Foreign Buildings Operations.

The Board of the Foreign Service is an interdepartmental board charged with making recommendations to the Secretary of State concerning the functions of the Service. Policies and procedures governing the selection, assignment, rating and promotion of Foreign Service officers fall within its province as well as those governing the administration and personnel management of the Service. The Board is made up of three Assistant Secretaries of State, the Director General of the Foreign Service, and representatives from the Departments of Agriculture, Commerce and Labor.

CHRONOLOGY OF INTERNATIONAL EVENTS, 1947

JANUARY

1—Britain considers establishment of Jewish state in Palestine when matter comes before London Conference Jan. 21.

2—In Nanking, China, 1,000 Chinese students demand the ouster of American servicemen from China.

3—French Colonial Minister Marius Montet fired on by Indo-Chinese snipers during inspection trip in Hanoi. New violence in Palestine as Jews issue peace appeal.

4—Fifty-five persons arrested in Budapest charged with plotting to seize the government in Hungary to restore the regime of Nicholas Horthy, former regent. UN Security Council announces it will meet in Athens Jan. 30 to make on-the-spot investigations in the Balkans. Bernard Baruch and his six associates resign as U. S. members of UN Atomic Energy Commission; urges that more atomic bombs be made.

6—British troops numbering close to 100,000 mobilized to crush open rebellion against law and order in Palestine. United States asks Russia and China to arrange to end Soviet military control of Dairen and open the Manchurian port to world traffic under Chinese administration.

8—James F. Byrnes resigns as U. S. Secretary of State; Gen. George C. Marshall confirmed as his successor. Russian and Hungarian troops join in raid on Budapest Ministry.

9—Great Britain cancels cabinet session on Palestine; decides to study peace with Germany as most important problem. United States calls on Poland to honor her pledge to hold free and unfettered elections. Anti-Semitism again flares up in German public life.

10—Italy appears ready to launch a new political group known as the Italian Socialist Party. Australia stands as only holdout against big powers' Foreign Ministers' decision to place Trieste under administration of UN Security Council.

11—Greek guerrillas around Mt. Vermion, west of Salonika, proclaim general mobilization. *New Times,* weekly Soviet foreign affairs publication, advocates internationalization of Panama Canal. Albanian government rejects British demand for apology and compensation for mine damage to two British destroyers and loss of 44 sailors.

14—Socialist Vincent Auriol is elected President of France's National Assembly, receiving support of the Communists in addition to his own party. Bombay police raid headquarters of Communist Party of India. The Netherlands demand a stern peace for Germany as deputies of four-power Foreign Ministers' work on German and Austrian treaties. Viet Nam nationalists renew attacks on French in Hanoi.

15—Australia proposes that UN Security Council create a disarmament commission.

16—Vincent Auriol elected President of Fourth French Republic. Great Britain and France agree to enter into a new military alliance against any fresh German menace.

18—Polish government mobilizes 500,000 police to guard polls in coming election. Chinese communists reject government bid to reopen truce talks.

19—Italian Premier de Gasperi resigns office.

20—Communists display strength in Brazilian elections, and win 324 of 444 Polish Parliament seats.

21—Gen. George C. Marshall takes oath of office as Secretary of State.

23—Entire Istrian Peninsula being vacated by Italian inhabitants on eve of transfer of the land from Italian to Yugoslav hands.

24—Poland's "free" election called a farce by members of U. S. House of Representatives who call for a housecleaning of Communists in the United States.

25—Six Chinese Communist Divisions routed by government troops in fighting near Chitamu in central Manchuria. Demetrios Maximos named as Premier of Greece to succeed Constantin Tsaldaris. Communists lead in Rio de Janeiro voting. Warren Austin, chief American delegate to the United Nations, reaffirms United

States full support of Baruch plan for international atomic control. Finn Ronne Antarctic Expedition sails from Beaumont, Texas, to be based on Marguerite Bay, Palmer Land Peninsula in the Antarctic.

27—British military forces place 90,000 Palestine Jews under arrest for the kidnaping of a British banker and a British judge.

28—Underground group in Palestine releases two British hostages. United States charges Polish provisional government with failure to carry out its pledges. Great Britain agrees to give Burma its independence. Chinese General Ho Peng-chu, Communist leader, and his 50,000 troops join with government troops. John J. McCloy, former Assistant Secretary of War in the United States accepts presidency of World Bank, taking the place vacated by Eugene Meyers.

29—United States drops its organized effort to end Chinese civil strife.

30—Chinese forces cut Peiping-Tientsin Railway line. Austria asks Four-Power Conference for a treaty so drawn as to operate as a magna carta. Italy asks for representation in writing in treaty with Germany.

31—Palestine government orders compulsory evacuation of British women and children from the Holy Land to clear the stage for action against terrorism.

FEBRUARY

1—Left-wing Japanese labor leaders challenged Gen. MacArthur's authority in calling off general strike. General Kotikov, Russian commandant for Berlin, makes open attack on Col. Howley, American deputy commandant, charging him with an attempt to sabotage the election of members of Berlin's Trade Union Federation. French forces locked in fierce combat with Viet Nam troops at Hue, capital of Annam Province in Indo-China.

3—Eleven former attendants at Ravensbruck concentration camp under Nazi rule sentenced to death for killing and mistreating Allied women prisoners. Herbert Hoover leaves United States to make a survey of food problems in occupation zones in Germany and Austria.

4—President Truman tells new Polish Ambassador Winiewicz that Polish provisional government failed to carry out its pledge to hold a free election.

5—Gen. Chiang Kai-shek recalls arch foe of Reds, General Ho Ying-chin, from his post in America as China's representative on UN Staff Committee. Yugoslav troops battle with British troops near Cobidilis on the Morgan Line.

6—Gerhard Eisler, alleged chief Communist agent in the United States, is cited for contempt by the House Un-American Activities Committee. U. S. Maritime Commission charges that Russia ignores efforts to regain 95 ships turned over to Soviets under lend-lease.

7—U. S. House Committee on Un-American Activities begins probe of Russian spy ring in Canada. British Cabinet considers compromise Palestine formula to permit 100,000 Jews from among European displaced persons camps to enter immediately a semi-autonomous Jewish province in the Holy Land.

8—Undersecretary of State Clayton states that Russia has ignored four requests by the United States to begin settling lend-lease debts. Prime Minister Attlee's Labor government faces a severe storm of criticism over coal crisis in England.

10—British Gen. R. W. M. De Winton murdered by a woman in Pola during Italian demonstration against treaty signed by Italy. Fuel famine in Britain makes 4,000,000 workers idle. Italy, Rumania, Bulgaria, Hungary, and Finland sign treaties terminating their part in Second World War, of these, Italy was reduced to a third-rate power, stripped of her colonies, and her Army and Navy cut to a shadow.

11—Chiang Kai-shek rallies economists to plan recovery from financial crisis as China's inflated dollar plunges to new low. Greek air ministry signs contract with Great Britain for delivery of airplanes and supplies. Gen. Mark Clark of American occupation forces, charges that freedom of speech is non-existent in the Soviet Union.

12—UN Security Council sets up an 11-nation "Commission for Conventional Armaments."

14—China suspends open dealings in gold bars and American banknotes. Soviets make new demands that atomic weapons be outlawed before any control system is set up.

15—Herbert Hoover reaches Rome in his journey to European occupied areas where he will study food conditions. Australia asks that small nations have a voice in dictating control policies in occupied Germany.

16—Russia protests Under-secretary Acheson's hostile attitude, claiming that he branded Red policy as aggressive and expansionist. United States extended a second $15,000,000 credit to Hungary.

17—In fight for national survival, China pegs dollars, restricts prices, and calls in fortunes abroad. Hundreds of Jews in Palestine go on strike for an hour in protest against deportation of 800 uncertified immigrants from Haifa to Cyprus. The United States informs the world that it intends to keep the strategic chains of mandated islands in the Pacific to ensure American security.

18—British Prime Minister Attlee announces that displaced persons in British occupation zones of Germany and Austria would be classified for possible employment in Britain's coal mines and the industries short of manpower. Soviet Russia insists that Austria deny citizenship to Germans who entered the country after Hitler's rise to power. Soviet newspaper, *Izvestia,* charges that Canada is turning over territory and troops to the United States in preparation for aggression.

19—In a sharp note, Secretary of State Marshall defended Undersecretary Acheson's assertion that Russian policy is an aggressive and expanding one. China asks permission to peddle $200,000,000 worth of UNNRA supplies on the black market to bolster its financial structure. Before UN Security Council, Soviet advances proposals to establish a separate world convention to outlaw atomic weapons and control regulations. UN Council hears British charge that Albania had committed crime against humanity by mining Corfu Channel whereby two British destroyers were damaged, with loss of lives among British seamen.

20—Blasts near port city of Haifa rip Iraq's Petroleum Company's pipeline early in morning after a night of terror marked by explosions, mortar, and small-arms fire. Prime Minister Attlee announces that it is the definite intention of Great Britain to turn India over to responsible Indian rule by June, 1948.

22—Soviet Foreign Minister Molotov states that United States explanation of Acheson's "aggressive and expanding" branding of Russian policy remarks was not convincing and Russia still regards such remarks as hostile and slanderous. Over 600 Jewish refugees captured aboard an illegal immigrant ship attempting to run British air-sea blockade of the Palestine coast. Soviets reported as evacuating port of Dairen with a view to returning it to Chinese control.

24—Franz van Papen, ace of Hitler's diplomatic corps, sentenced by a German denazification court to eight years at hard labor. Russia reported as organizing and training Korean troops. Hoover and Hugh Gibson, former Ambassador to Belgium, returned from studying food problems in Germany and Austria. Allied police forces round up hundreds of diehard Nazis who apparently fostered a secret bacteriological weapon aimed at restoring Germany's armed might.

25—Secretary of State Marshall announces Russia has agreed to United States trusteeship over former mandated Japanese islands in the Pacific.

26—President Truman sends to U. S. Congress a bill calling for unification of armed forces under a single national defense establishment. Belgian police fire machine guns in effort to break up a demonstration of former war and political prisoners. Gromyko, delegate for Russia on the Security Council, seeks to hedge American control of former Japanese mandated islands in Pacific.

27—Truman rebukes Bevin for charging that White House stand on Palestine was based solely on politics.

28—Herbert Hoover urges that U. S. overseas relief efforts be on loan rather than gift basis. British announce agreement on a British-French treaty of alliance. Faced with domestic economy collapse, Great Britain asks United States to assume British responsibilities in Greece to forestall Russian aggression in that country. Spanish Falangists clash with monarchists in Madrid. Bomb explodes in Haifa business district as an intercepted refugee ship with 1,350 unauthorized immigrants aboard was escorted into Palestine waters.

MARCH

1—Terrific explosion wrecks British officer's club in heart of Jerusalem. Chiang Kai-shek becomes Premier of China as his brother-in-law T. V. Soong resigns in row over China's financial crisis. Two American Army officers captured and held by Chinese Communists in Manchuria.

2—British impose statutory martial law in the Measherarim Jewish district of Jerusalem.

3—President Truman makes good-neighbor visit on President Aleman of Mexico. Truman asks Congress to end draft for military service, effective March 31.

4—Secretary of State Marshall calls for immediate U. S. aid to Greece to forestall Russian menace. Britain and France sign 50-year pact against Germany. Norwegians deny Russian request for military bases on the Arctic Archipelago of Stizbergen. Stalin resigns as Minister of Armed Forces and turns job over to his principal assistant, Gen. Nikolai A. Bulganin.

5—Admiral d'Argenlieu ousted by French Cabinet as High Commissioner for Indo-China. Sir Evan Jenkins, British Governor of the Punjab, takes over the provincial government to break up communal rioting. Great Britain announces plan to reduce size of Royal Navy 60% during 1947.

6—United States Supreme Court upholds District Court's ruling against John L. Lewis and United Mine Workers Union; reduces Union fine from $3,500,000 to $700,000. Russia announces Soviet frontiers never will be thrown open to unlimited international inspection nor will Soviet factories be allowed to operate under United Nations control.

7—Polish Government accuses American Ambassador Arthur Lane of launching anti-Polish campaign in United States. Sixty Dutch Marines take physical possession of disputed American Liberty ship in Java. A Hungarian official states that Soviets did not permit Hungarian newspapers to print American note protesting Russian interference in Hungarian affairs.

8—Chinese Communists massing around naval base city of Tsingtao. Fiorello La Guardia seeks labor merger into an American Congress of Labor. Sun spots interfere with radio communications. Communist revolt flares up in Asuncion, Paraguay, resulting in death of seven persons. Dutch workmen unload confiscated cargo of American Liberty ship at Tandjongpriok, Java.

9—Russian Gen. Sviridov vetoes an American and British suggestion that a committee of Allied and Hungarian officials investigate Hungarian politicians accused of plotting against the republic.

10—Foreign Minister's Conference opens in Moscow. Molotov injects political situation in China into opening session of the Council. The Chinese nationalist government proclaims martial law to prevent rebellion in Formosa.

11—France, Great Britain, and the United States join forces to block Russia's efforts to consider Chinese conditions in Minister's conferences.

12—Speaking before a joint session of the United States Congress, President Truman asks for $400,000,000 to help Greece and Turkey. British Secretary Bevin accuses Soviet of failing to report number of German prisoners of war held outside of Germany. At a meeting of UN Security Council, coalition of nations blocks approval for a United States trusteeship over Jap-mandated islands in the Pacific.

13—Paraguayan government planes bomb rebel military objectives at Concepcion. Seven countries, including Great Britain and the United States, protest Bulgarian government's behavior towards foreign diplomats.

14—UN investigating commission fired on by guerrillas while en route through western Macedonia to Albania. The Soviet government newspaper *Izvestia* accuses the United States of interfering in the internal affairs of Greece and Turkey.

15—France proposes dispersion of Germans in order to lower the German potential. United States envoy summoned home from Turkey. Great Britain's mine-laying charges against Albania were returned to the UN Security Council for further study.

16—Jewish terrorists blow up a British post exchange store near Hadera.

Assistants.—John W. Fihelly, Charles B. Murray, Cecil R. Heflin, Grace B. Stiles, John B. Diamond, Arthur J. McLaughlin, William Hitz, Sidney S. Sachs, J. Warren Wilson, John C. Conliff, Jr., John P. Burke, Sylvan Schwartz, Joseph F. Lawless, Helena D. Reed, John J. O'Leary, Daniel B. Maher, Andrew J. Howard, John D. Lane, Oliver O. Dibble, William S. McKinley, Evan T. Davis, Edward Molenof, Richard M. Roberts, James C. McKay, C. Frank Reifsnyder.

CIVIL SERVICE IN THE UNITED STATES

By Harry B. Mitchell

President of the United States Civil Service Commission

FEDERAL CIVIL SERVICE LEGISLATION

The following laws affecting Federal employment were enacted by Congress during the year:

Public Law 101. Section 305 of this law prohibits strikes against the Government by Federal employees. Any such employee who strikes shall be discharged from Federal employment, shall forfeit his civil service status, if any, and shall not be eligible for reemployment for three years by another agency of the Government.

Public Law 313. This statute authorized the creation of 30 scientific and professional positions in the Department of the Army and the Department of the Air Force, and 15 in the Department of the Navy at compensations between $10,000 and $15,000 a year. Heretofore the general salary ceiling fixed by Congress is $10,000.

Public Law 325. Under Section 14 of the Veterans' Preference Act of 1944, appeal procedure to the Civil Service Commission provided only for recommendation by the Commission to the department or agency as to action to be taken in the case of any veteran. Public Law 325 provides that the agencies shall carry into effect the recommendation of the Commission.

RETIREMENT LEGISLATION

The Act of July 11, 1947 provides for annuities for the investigatory personnel for the Federal Bureau of Investigation after completion of 20 years of service upon reaching the age of 50. This is a much more liberal provision than is granted to any other group of Federal employees. By Act of July 21, 1947 the Congress included under the Federal retirement system Official Reporters of Debates of the Senate and their employees.

On July 24, 1947 there was approved

a statute which brought a small group of employees of the Panama Railroad Company within the Canal Zone Retirement Act. On Aug. 4, 1947 there was enacted a law amending the Canal Zone Retirement Act to provide for the re-computation of annuities to those who had retired prior to July 29, 1942 in order to give them the benefit of the higher computation possible under the 1942 Act.

On July 30, 1947 the service restriction on the payment of refund of retirement deductions was raised to ten years of civilian service. Theretofore only those persons who had service of less than five years, including military service, could secure refund of retirement deductions upon separation from the service.

NEW CIVIL SERVICE RULES

On Feb. 24, 1947 the President issued an Executive Order promulgating new civil service rules effective May 1, 1947. Existing instructions, regulations and executive orders were consolidated in the new rules and regulations which combined the best and most successful policies developed during the war years. These rules and regulations displaced the temporary rules and regulations issued in March 1946. Under these rules the Commission, to the extent of its resources, has been holding competitive examinations to reestablish the merit system on a permanent basis. In June 1946 approximately 60 per cent of the Federal employees were serving under temporary or war service appointments of limited duration. By June 1947, although there had been a heavy reduction in force during the year, the percentages were reversed.

It had been the practice to let career employees who were dropped because of reduction in force shift for themselves in securing new appointments with the Government. The Federal Commission inaugurated a policy whereby such employees are given first opportunity to fill positions, and the departments and agencies have been required to displace war service and temporary employees in order to assure that career employees are considered for appointment. Care was exercised to see that employees thus certified were fully qualified. Several thousand former employees have received employment through this plan and they are continuing their careers as government workers. The plan has been applied only to employees who have a regular civil service status.

UNITED STATES SUPREME COURT DECISIONS

Two important decisions have in effect declared the provisions of Section 9(a) and Section 12(a) of the Hatch Act to be constitutional. One of them in a case brought by the United Public Workers of America (CIO) upheld the Civil Service Commission's power to adjudicate political activity cases of the incumbents of Federal positions in the government service. The decision means that Federal employees remain subject to the same political activity restrictions as have been applied for many years under the civil service rules. The second decision related to employees of a state government in an activity financed in whole or in part by Federal funds. The constitutionality of this section of the Hatch Act was upheld by the Supreme Court.

ADMINISTRATIVE PROCEDURE ACT

This Act governs the employment of hearing examiners throughout the Federal service and requires their appointment to be made under the Civil Service Act. They may be removed only for good cause established and determined by the Commission after opportunity for hearing and upon the record thereof, and they are to receive compensation prescribed by the Commission independently of the agencies' recommendations or ratings and in accordance with the Classification Act of 1923, as amended. There are 14 different agencies of the Federal Government which employ hearing examiners within the purview of this statute.

LOYALTY INVESTIGATIONS

By Executive order a program was established for a loyalty investigation of employees in the executive branch and all prospective appointees. The Federal Bureau of Investigation with the Civil Service Commission and the employing agencies cooperate in the program for which Congress provided funds at the end of July. The purpose of the order is to prevent employment of persons not loyal to the United States. Every precaution has been taken to protect the rights of incumbent employees. A Loyalty Review Board has been established, consisting of outstanding citizens not otherwise connected with the government, and this Board has full authority to review any case of a person separated on any question of loyalty by an employing agency.

LEAVE ACCUMULATION ACT

By Act of Congress approved July 25, 1947 the maximum limitation on unused annual leave has been restored to the original 60 days. During the war when many employees took little if any leave Congress authorized extension up to 90 days. The new law provides that those employees who had accumulated by July 25 more than 60 days up to the maximum of 90 days will not lose the additional accumulation. Hereafter, however, not more than 60 days annual leave may be accumulated.

SUBVERSIVE ACTIVITY

An employee of the Federal Works Agency was conditionally transferred to the War Manpower Commission, subject to subsequent investigation, and brought within the scope of the War Service Regulations which provided that an applicant may be denied appointment if a reasonable doubt exists as to his loyalty to the Government of the United States. The Civil Service Commission conducted a thorough investigation as to the employee's character and fitness and determined that there was reasonable doubt as to his loyalty based on his membership and activities in an alleged Communist-dominated organization, and the agency was requested to terminate his services. On review of the record by the court, it declared that this was not a case of removal after employment, but removal on the basis of ineligibility, and thus did not constitute a violation of the Hatch Act or an infringement of the employee's constitutional liberties as guaranteed by the first and fifth amendments. (*Friedman v. Schwellenbach, et al.*, 65 F. Supp. 254.) The District Court upheld the determination of the Civil Service Commission. (65 F. Supp. 254.)

GOVERNMENT REORGANIZATION

As reported in 1946, the Reorganization Act of 1945 gave the President authority for two years to issue executive orders to bring about reorganization of the government. Three orders were presented to Congress in 1946, one of which was disapproved. In 1947 three additional orders were issued, two of which became law.

Reorganization Plan No. 1 of 1947 transferred to the Department of Justice the Office of the Alien Property Custodian, except the functions relating to the Philippine Alien Property Administration which continued as a separate agency. Functions of the Office of Contract Settlement were transferred to the Treasury Department as were also those relating to certain internal revenue activities under the National Prohibition Act. Certain research functions of eight bureaus of the Department of Agriculture were concentrated in the Department of Agriculture, and credit union functions of the Farm Credit Administration were transferred to the Federal Deposit Insurance Corporation. Further consolidation relating to the disposal of surplus property was brought about in the War Assets Administration.

Reorganization Plan No. 2 was disapproved by both Houses of Congress and therefore did not become law. It proposed to transfer the United States Employment Service to the Department of Labor, and affected also the Wage and Hour Division and the administration of labor laws on Federal public works contracts.

Reorganization Plan No. 3, which became law, establishes the Housing and Home Finance Agency and groups together as constituent operating agencies—(1) A Home Loan Bank Board to administer the Federal Savings and Loan Insurance Corporation, the Home Owners' Loan Corporation, and the functions of the Federal Home Loan Bank Board and its members; (2) a Federal Housing Administration with the same functions as now provided by law for that agency; and (3) a Public Housing Administration to take over the functions of the United States Housing Authority and certain remaining emergency housing activities pending the completion of their liquidation. Each constituent agency will possess its individual identity and be responsible for the operation of its program.

On July 7, 1947 the President approved a bill establishing the Commission on Organization of the Executive Branch of the Government. This Commission is to make a thorough study of the organization of the executive branch with a view to promoting economy, efficiency, and improved service in the transaction of public business. Its membership, numbering 12, comes from Congress, private life, and the executive branch. Former President Herbert Hoover is Chairman, and the Commission has until ten days after the convening of the Eighty-first Congress in January 1949 to make its report of findings and recommendations to Congress.

EMPLOYMENT IN THE EXECUTIVE CIVIL SERVICE

The downward trend in Federal civilian employment continued during the year. On Jan. 30, 1946 there were 2,299,007 civilian employees in continental United States and 423,000 outside. By June 30, 1947 these numbers were down to 1,849,847, and 281,322, respectively, a total reduction of 590,838. Further reductions brought the number during September 1947 down to 1,766,650 for continental United States and 257,146 outside, a total of 2,023,796. The peak for civilian employment in continental United States was reached in June 1943, totaling 3,156,953; and although this number was down to 2,915,476 by June 30, 1945, employment outside continental United States climbed to approximately 850,500, a grand total on that date of 3,765,976, the highest number of civilian employees at any one time. The accompanying table shows the number employed in continental United States at the end of each fiscal year in two-year periods.

	June 30, 1939	June 30, 1941	June 30, 1943	June 30, 1945	June 30, 1947
Competitive classified positions	622,832	990,218	*	*	1,037,353**
Unclassified and exempt positions	297,478	367,932	*	*	812,494**
	920,310	1,358,150	3,156,953	2,915,476	1,849,847

* Statistics showing the division between competitive classified positions and unclassified positions are no longer available under war service appointment procedure.

** Estimated.

There were 400,931 women employed full time in continental United States at the end of September 1947. The percentage of veterans employed increased during the year ending with September from 38 to 44 for both men and women; among the men alone it was 54 as contrasted with 51 the year before. After V-J Day the percentage of veterans employed in September 1945 was only 18. The total number of persons entitled to preference who were employed in September 1947 was 770,027, of whom 37,587 were women.

CIVIL SERVICE IN THE STATES

On the ground that pensions paid to disabled employees are in the nature of workmen's compensation, firemen and policemen in New York City, who are retired as a result of service-connected disabilities, are not required to pay Federal income taxes on their pensions. This is the substance of two separate rulings issued by the Federal Bureau of Internal Revenue. These rulings are generally applicable under similar circumstances.

A survey shows a substantial increase in the number of municipal employees for the first time in several years, the increase amounting to 123,000 for the year ending October 1946. The survey also shows a steady trend in the direction of shorter hours for city employees, 57 per cent of the 900 cities studied having work-weeks of less than 42 hours. The figures from the United States Census Bureau reveal that the country's five largest cities—New York, Philadelphia, Chicago, Detroit, and Los Angeles—employ together one-fourth of all municipal employees in the United States. At the end of 1946 there were more than 980,000 municipal employees in the United States.

CALIFORNIA

Military leave is granted state employees who are required to take part in training courses as members of the National Guard, or of military or naval reserve units. State employees with a year or more of service are allowed up to 30 days leave with pay each year to attend military training courses.

Where a statute providing for definite periods of sick leave with pay authorizes the personnel board to grant additional sick leave, the board may include within the scope of "sick leave" such matters as attendance on a member of the employee's immediate family seriously ill, absence necessitated by death in employee's immediate family, exposure to contagious disease, or other reasonable situation impliedly authorized by the statute. A rule of the commission extending such reasonable privileges under a general legislative policy setting forth basic standards is not a delegation of legislative authority, but is within the purview and spirit of the statute. (*Nelson v. Dean,* 168 P. (2d) 16 Cal.)

CONNECTICUT

Beginning Jan. 1, 1948, Connecticut state employees are given the opportunity to participate in a group life insurance plan financed in part by state funds. The plan, embodied in a bill passed at the last session of the legislature, allows each full-time employee to purchase a $1,000 policy if his salary is less than $2,000 per year. Employees whose annual salaries are more than $2,000 can purchase life insurance up to a maximum of $2,000.

FLORIDA

The state legislature recently enacted a state-wide veterans' preference law applying to all cities within the state having civil service programs. The law provides that five points shall be added to the final examination grades of honorably discharged veterans, provided that they first achieve a passing grade in the examination, and that ten points shall be added to the grades of disabled veterans, wives of disabled veterans, and widows of deceased veterans. It further provides that, in the case of disabled veterans whose disability is rated by the Veterans' Administration as 30 per cent or more, such veterans are to be placed at the head of the eligible list, except for positions in professional and scientific services for which the entrance salary is over $3,000 a year. The law also provides that veterans shall be given preference in reinstatement, reemployment, and in retention in the event of reduction in force.

The constitutionality of the Duval County, Florida, civil service act adopted by the Florida legislature in 1943 was attacked on four points; (1) that the statute by empowering the civil service board to make rules for carrying out the act was an invalid delegation to the board of legislative power; (2) that it denied equal protection to both those in the classified and unclassified service in that it excluded elective and appointive officials and others requiring technical and scientific training from having a classified status; (3) that the civil service act deprived citizens of property without due process of law; and (4) that it violated the state constitutional provision against creation of any office with a term longer than four years. The court maintained that the grounds on which the act was attacked were untenable.

ILLINOIS

In a case before the Supreme Court of Illinois an attempt was made by the legislature to reinstate a policeman who was a war veteran and who had been dismissed from the Chicago city service for falsifying his age when he took the examination for patrolman. Several years after appointment he was dismissed on charges that he had misrepresented his age at the time of examination. In 1945 a special act was passed providing that "no person appointed in the classified civil service who is entitled to military preference . . . shall be removed or discharged because he misstated his age. Any such person so discharged shall be immediately reinstated upon the taking effect of this amendatory act."

The court upheld the validity of preference in civil service appointments for veterans as valid class legislation. However, class legislation which grants a particular class of veterans immunity "from the consequences of falsely stating his age on an application for examination" is invalid discrimination. The court held the attempt of the general assembly which not only sought to grant the veteran immunity from the consequences of his fraudulent act, but to secure for him a reinstatement in his position which he fraudulently obtained in the first place, as repugnant not only to the constitutional prohibition against discriminatory class legislation, but as "likewise repugnant to basic morality." (*Jendrick v. Allman,* 71 N.E. (2d) 44.)

LOUISIANA

A comprehensive retirement plan, based on actuarial principles, for employees of the city of New Orleans has been adopted. Coverage of the new system extends to all city employees; elected officers and persons appointed for fixed terms may join at their option. The plan calls for a 5 per cent payroll deduction from each employee's salary, which is matched by funds contributed by the city. Employees may retire at age 60, and retirement is compulsory at age 70. The plan stipulates that the compulsory retirement age shall be lowered one year every three years until, at the end of 15 years, the compulsory retirement age is 65.

MICHIGAN

City employees of River Rouge have been placed under a retirement system which calls for a five per cent deduction from each employee's salary.

MINNESOTA

The legislature provided substantial pay increases for state employees. This was accomplished by eliminating the lowest pay range in the state pay plan, and adding four new ranges at the top. Pay rates will be adjusted to the next higher range, and employees will also receive a three-step cost-of-living pay increase. According to statistics of the Minnesota State Civil Service Department, 90 per cent of all job openings in the state service filled from eligible lists during a period of 22 months were first offered to veterans.

NEW JERSEY

City employees in eight New Jersey municipalities were placed under civil service as the result of referenda on the question of civil service extension at recent elections. Voters approved adoption of the state-administered civil service system in Hackensack, Hoboken, Mount Holley, Riverside, Vineland, Bayonne, North Bergen, and West New York. In Montclair, the proposal to adopt civil service was defeated. Municipalities within the state have the option of coming under the civil service program administered by the state civil service department. There are now 80 public jurisdictions in New Jersey where employees are under civil service. This includes, in addition to the state service, 64 municipalities, 14 counties, and the Newark Board of Education.

In the same elections, voters approved participation in the state-wide public employee retirement program in the following localities; Bergenfield, Fairview, Hackensack, Mount Holley, Phillipsburg, Ruthersford, Washington, and in Monmouth County. In 12 communities, where proposals to raise the pay of policemen, firemen, and other employee groups were voted on, the measures were approved.

State employees who take part in training courses as members of the National Guard, or of military or naval reserve units, are given leave with full pay up to two weeks. If the training period extends beyond two weeks, the employee receives the difference between his military pay and his state pay for a period of 30 days after the first two weeks.

NEW MEXICO

By legislative approval, public employee retirement plans became effective Aug. 1. Under the plan employees will contribute 3½ per cent of their monthly salaries, and the employer will contribute an equal amount.

NEW YORK

Veterans with "zero per cent" disability ratings are not entitled to preference as disabled veterans, as provided in the New York state constitution, and only those veterans who have a disability rating of at least 10 per cent are entitled to preference as disabled veterans. That is the substance of the court's decision in a test case (*Winteritz v. New York City Civil Service Commission*), on which the New York Court of Appeals ruled on July 2. The decision upheld a previous ruling by the lower court.

Strikes by public employees in New York are banned under a bill passed and signed by the Governor. The measure, which evoked heated protest from public employee organizations, applies not only to New York State employees, but also to employees of local governments within the state. Under the new anti-strike law, any public employee who goes on strike automatically forfeits his job. The law further provides that reinstated strikers are placed on probation for five years, during which they are denied the protection provided in the civil service law in the event of discharge, their employment being entirely at the pleasure of the appointing authority.

In New York, legislation based on recommendations by the State Salary Standardization Board will result in extensive reorganization of pay schedules. Under the new plan, 50 salary grades are set up, each containing a minimum, a maximum, and four within-grade step increases. Wartime emergency pay increases that have been granted to employees in the past are made a part of the permanent state salary structure.

NORTH DAKOTA AND OREGON

The state of North Dakota has adopted a retirement system for its state employees. The Oregon state legislature authorized pay increases for 60 top statutory and administrative officials in the state service, including the Governor, Secretary of State, State Treasurer, and Attorney General.

TEXAS

The Texas Supreme Court upheld the constitutionality of a Dallas ordinance forbidding city employees to join labor unions.

A new Texas law, passed during the last session of the legislature, requires that a referendum be held on the question of adopting civil service for firemen and policemen in all cities of 10,000 or more population. The law, which became effective Sept. 5, provides that a special election be scheduled within 90 days after the effective date. According to the 1940 Federal Census, 48 Texas cities have populations of 10,000 or more. Eight of these—Amarillo, Corpus Christi, Dallas, El Paso, Fort Worth, Houston, San Antonio, and Waco—already have civil service laws in effect.

The law provides for the appointment of a three-member fire and police civil service commission, and further provides for the appointment of a director of civil service by the Commission. One provision of the law prohibits firemen and policemen, covered by the act, from engaging in strikes, under penalty of automatic dismissal, fine, and imprisonment.

Texas adopted a retirement plan for its state employees.

VIRGINIA

Fire and police department employees in the city of Richmond are to be placed under a merit system, according to a directive issued by the Mayor. At the present time, the city has no formal civil service system in any of its departments. A citizen commission has been named to study the city's government structure and make recommendations concerning needed improvements in the charter. Four cities in Virginia recently took advantage of the state retirement act and placed their employees under the plan. The cities are Winchester, Lexington, Martinsville, and Harrisonburg.

WASHINGTON

Legislation was enacted which calls for pensions ranging from $100 to $150 per month after 35 years of service. Retirement is optional at age 60 and compulsory at age 65. Employees contribute 5 per cent of their salaries up to $3,600 a year, beginning Oct. 1, and the state matches the employees' contribution. This is limited to state employees, and contains an unusual feature in that it is open to appointed and elected state officials, except for members of the legislature.

WISCONSIN

In Wisconsin, the Acting Governor approved a bill continuing the emergency salary increases that have been granted to state employees. A civil service program, administered by a five-man committee, was adopted for employees of Brown County.

DIVISION IV

STATE GOVERNMENT

STATE ADMINISTRATION AND LEGISLATION

By Arnold A. Sio
Research Assistant, Council of State Governments

GENERAL

State legislatures in 1947 dealt with problems resulting from the return to peacetime government and, for the first time in several years, with matters not related to the war or its direct aftermath.

Educational and welfare services, labor relations and workmen's compensation, institutional and highway construction programs, administrative and legislative reorganization, state and local revenues, and veterans' affairs were among the major subjects acted upon in 1947.

Further insight into the kinds of subjects that were important during the legislative year is provided by the interim study topics assigned to legislative research committees and legislative research councils by 1947 legislatures. Results of these studies will form the basis for 1948-49 legislation.

Interim study assignments include only ten inquiries into veterans' affairs in six states, indicating the shift away from matters connected with the war. Sixty-two separate studies of the organization and operation of state government were assigned in 27 states. Some 52 studies dealing with tax and fiscal policy and related subjects are being conducted in 21 states. Thirty-two studies of education and educational facilities were assigned in 22 states. Eighteen inquiries into the field of labor relations, unemployment and workmen's compensation are under way in 12 states. Legislative procedure, state institutions, health and welfare, and the problems of minors and juvenile delinquency are receiving widespread attention.

Legislative sessions were held in all states but Kentucky. These included regular sessions in 44 states, excluding only Kentucky, Louisiana, Mississippi, and Virginia. In addition, the Louisiana, Mississippi, and Virginia legislatures met in special session.

EDUCATION

The nation's educational needs became one of the focal points of legislative attention during 1947. Legislative action regarding teachers' salaries was particularly significant.

More than 30 states legislated to increase teachers' salaries. As a result, American teachers in 1947-48 will receive $350,000,000 more than they were paid in the 1946-47 academic year. Comparable figures for 12 states indicate that salary increases average approximately $450 a year.

Many states, including Indiana, Maine, Pennsylvania, and Texas, passed laws providing higher minimum salaries for teachers. Arkansas raised its minimum to $2,100 for a teacher with a college degree having the teaching certificate for which the degree is required.

Several states provided specific bonuses or other increases. Among these, was the Tennessee bonus of $300 a year to all public school teachers and administrators. Rhode Island granted an annual increase of $600 to each teacher, Georgia increased salaries about 50 per cent, and North Carolina about 30 per cent.

Benefits granted teachers in 1947 included the establishment of a teachers' retirement plan in Vermont, extension of the retirement system in Wyoming, and increased retirement allowances in West Virginia among other states.

In North Carolina, salaries accounted for $102,000,000 of total appropriations of $128,000,000 for public schools; New Hampshire increased state aid to schools some 500 per cent; Idaho appropriated $8,000,000 for public schools as opposed to $3,000,000 for the preceding comparable period; and Massachusetts increased her aid by $25,000,000 annually.

Idaho, Texas, and 21 other states authorized investigations of state educational systems. Measures to reorganize the school system were passed in Idaho, Indiana, North Dakota, and Wyoming. The School Lunch Act was adopted by many states.

HEALTH AND WELFARE

In 1947, Arizona, Iowa, Oregon, and Texas were among the states that authorized hospital construction surveys and provided for state acceptance of Federal funds for such undertakings.

At least three states legislated on the subject of alcoholics. Wisconsin established a bureau of alcoholic studies, and Pennsylvania and Massachusetts formed commissions to study the problem. Alabama, Connecticut, New Hampshire, and New Jersey have been active in this field for some time.

Recent increases in sex crimes led Wisconsin to adopt a law designed to hospitalize potential sex criminals before they can commit crimes. Massachusetts and New Hampshire created study commissions with a view toward future action in this field.

Some 20 states enacted legislation designed to eliminate conditions leading to juvenile delinquency, and to rehabilitate aberrants. A youth service division of the state welfare department was created in Wisconsin; Florida formed a children's commission designed to effect cooperation between public agencies and citizen-sponsored youth welfare services. Youth guidance agencies established in previous sessions were continued in California, Illinois, and New York, and Mississippi set up a system of youth courts. Commissions to investigate youth problems were established in Massachusetts, Michigan, and New Jersey.

Legislation in 1947 added Delaware, Kansas, and Montana to the states requiring pre-marital syphilis examination; Tennessee and Wisconsin provided funds for care of tuberculosis victims. Allowances for the aged, the blind, and dependent children were increased in a number of states.

West Virginia, Delaware, and New York were among the states providing increased funds for local public health activities and for state health and welfare centers.

State welfare administrative reorganizations occurred in Colorado and Montana, among other states, and were primarily designed to coordinate activities.

LABOR

Labor legislation in 1947 dealt primarily with industrial relations and workmen's compensation. Of the legislatures meeting in 1947, more than 25 enacted laws to regulate union activities. No less than 14 states passed laws prohibiting closed shop agreements. Restrictions were placed on secondary boycotts, picketing, and jurisdictional strikes. A number of states adopted legislation regulating labor relations in public utilities.

Various states legislated against strikes or lockouts in public utilities. Arbitration of such union activity was made compulsory in Florida, Indiana, Michigan, Nebraska, New Jersey, Pennsylvania, and Wisconsin. In Florida, Michigan, and Nebraska, among others, injunctions may be used to enforce decisions of the arbitration board. Four states authorized the governor to seize and operate public utilities if labor disputes can not be settled.

"Right to work" or anti-closed-shop laws were enacted in Arizona, Delaware, North Dakota, Texas, and 11 other states. The measures are subject to popular ratification in some states, including North Dakota and Arizona. New Hampshire's enactment, prohibiting union security agreements, applies only to firms with five or less employees. Maine prohibited closed-shop contracts but sanctioned union-shop contracts. Secondary boycotts are prohibited in California, Delaware, Idaho, and eight other states. Laws regulating or outlawing strikes in connection with jurisdictional disputes were adopted in California, Massachusetts, Michigan, Missouri, Pennsylvania, and Wisconsin.

Labors laws in Delaware, New Hampshire, and North Dakota included union registration provisions and the filing by unions of financial reports. Several states adopted legislation providing that labor organizations may sue or be sued.

Connecticut enacted a comprehensive law prohibiting employment discrimination because of race, color, or religion. The only other 1947 legislation of this type was Oregon's (Fair Employment Practices Committee) FEPC law which, like earlier Wisconsin and Indiana laws, is without enforcement provisions.

In the field of workmen's compensation, more than 20 states amended their laws to increase disability and death benefits and to provide additional coverage. South Dakota, Vermont, and West Virginia were among the states adopting the Second Injury Fund Amendment to amend workmen's compensation systems. With the passage of occupational disease laws in Iowa, Nevada, Texas, and three other states, 39 states in varying degrees now protect workers against the hazards of occupational diseases. Other 1947 changes included the payment of compensation in Delaware for the entire period of disability instead of limiting it to 500 weeks, and increased medical benefits for workers in that state and in Iowa, Kansas, Maryland, New Mexico, and Rhode Island.

CHILD LABOR

A number of changes in state child labor laws produced by legislative action in 1947. Alabama became the eighteenth state to establish the basic 16-year minimum age for employment of minors and the Illinois law fixing that minimum age became effective last June 30th. At least 11 states, including Alabama, Kentucky, and New York, strengthened child labor laws. Certain requirements restricting child labor were reduced in a number of states, including Massachusetts and Texas. Some of these states also enacted laws increasing requirements. Child labor study commissions were established in four states.

TAX LEGISLATION

Legislatures in 1947 faced demands for increased appropriations and, with few exceptions, provided additional revenues to finance the business of state government. Except in the realm of individual and corporate income levies where some reductions were realized, the bulk of 1947 tax legislation took the form of increased rates or new taxes.

Individual income tax rates were increased in Colorado, Maryland, and Oregon; Iowa accomplished a similar effect by repealing the 50 per cent credit; Vermont dropped a flat 2 per cent levy in favor of rates graduated from 1 per cent to 4 per cent; New York, on the other hand, continued a 50 per cent reduction sanctioned in 1946; Oklahoma reduced tax rates from 9 to 6 per cent. Personal exemptions were lowered in Colorado, Oregon, and Vermont, and raised in Arkansas and Oklahoma.

Corporate income tax rates were increased in five states and reduced in Oklahoma. Rhode Island added an alternative income base to the present corporation tax and doubled the tax on unincorporated business.

A record number of states enacted

a tobacco tax. Cigarette taxes were doubled in Maine and Pennsylvania and raised in five other states. Gasoline taxes were increased in seven states and in the District of Columbia. Idaho, Michigan, and Pennsylvania enacted new use-fuel taxes. Taxes on distilled spirits were doubled in Wisconsin and Tennessee and increased in several states. Beer and wines taxes were also increased by a number of states.

PROPERTY LEGISLATION

With the adoption of community property laws by Michigan, Nebraska, and Oregon in 1947, 12 states now operate under this concept of property. A community property law enacted by Pennsylvania in 1947 was later declared unconstitutional by the state supreme court.

FISCAL LEGISLATION

The financial problems of local governments in obtaining funds to carry on services led to increased aid by most states and to state authorization of new sources of income for local governments. State efforts to bolster local finances included a Virginia enactment authorizing a bank stock tax; laws permitting cities to impose hotel bill taxes in New York and Rhode Island; and the authorization of numerous additional taxes in New York City. California distributed $90,000,000 of the state reserve to cities; Ohio and Michigan allocated a large share of sales tax revenues to cities; and Louisiana, Rhode Island, and New York provided municipalities with large pari-mutual revenue.

In 1947, debt increases occurred in 18 states, and net reductions were effected in 29 states. Of the 29 states recording declines, New York led, followed by North Carolina, Minnesota, and Maryland.

The total state debt of $2,750,000,000 was $580,000,000, or 25 per cent, higher than in 1946. This increase mainly reflected major borrowing by three states—Illinois, Massachusetts, and Michigan—in connection with financing of veterans' bonus payments and services. Thus in 1947 the downward trend in state debts which began in 1940 was reversed.

VETERANS

The shift in legislative emphasis in 1947 from war-connected to peacetime matters is exemplified by enactments in the field of veterans' affairs. Contrasted with 1945-1946, when the major portion of state legislation dealt with the needs of returning veterans, 1947 veterans' legislation was largely restricted to bonus measures.

State bonus legislation for veterans was enacted by some 21 states in the years following the First World War. With respect to the Second World War, Vermont provided a veterans' bonus in 1942 and New Hampshire in 1943. Several more states took action on this matter in 1945, and a still larger number considered bonus measures at the regular 1947 legislative sessions.

As of December 1947, nine states—Connecticut, Illinois, Massachusetts, Michigan, New Hampshire, New York, Ohio, Rhode Island, Vermont—had approved a bonus for veterans of the Second World War. Bonus referenda in 1948 will be held in Indiana, Iowa, Minnesota, North Dakota, Pennsylvania, South Dakota, and Wisconsin. If all seven states approve present bonus plans, veterans, by 1950, will have received at least $2,000,000,000 from 16 states. So far, Maine is the only state in which voters have rejected a Second World War bonus that had been approved by the legislature.

The Ohio Temporary Soldiers' Vote Law was made a permanent law in 1947; Wisconsin legislators established a Veterans' Housing Authority to deal with the acute problem of housing for veterans; California extended the period in which funds are available for the acquisition of emergency housing, and provided for home and farm purchases by veterans' widows. The Arkansas legislature increased the amount that veterans may borrow to purchase farms and homes from $3,000 to $6,000 because of the increase in real estate costs.

The Minority of Veterans Act was adopted by Indiana, Ohio, North Dakota, Oklahoma, and South Dakota. This law enables Second World War veterans who are minors to obtain benefits under the Servicemen's Readjustment Act of 1944.

HIGHWAYS AND MOTOR VEHICLES

Increased appropriations for construction, the establishment of uniform requirements and regulations, and the enactment of highway safety measures were the significant developments in this field during 1947.

Several states, including California, Georgia, and New Hampshire, authorized construction of new toll roads or the extension of existing turnpikes. Study commissions to recommend highway development programs were formed in a number of states. Highway appropriations were considerably higher than in the past because of the resumption of road construction and the large amount of work deferred by the war and the increased cost of material and labor.

Texas' enactment of the Uniform Traffic Act increased to 33 the states enforcing the uniform act. Prior to 1947, 38 states had enacted the Uniform Motor Vehicle Safety Responsibility Act. In 1947, six states approved amendments to bring legislation closer to the uniform act. Financial responsibility laws were adopted by Florida, New Mexico, and Wyoming.

AVIATION

Indicative of growing state responsibility in developing air facilities, 12 states during 1947 established or expanded their aeronautics commissions.

At least 24 states enacted laws which require the channeling of Federal grants for local airport construction through state aviation agencies. Georgia, Indiana, Maryland, and West Virginia, among others, adopted the Model Municipal Airport Act enabling municipalities to fulfill certain obligations under the Federal Airport Act. Legislatures in Maine, Massachusetts, Minnesota, New Hampshire, New Jersey, New York, Pennsylvania, and Illinois appropriated state funds for the development of airports.

Model airport zoning legislation was enacted in four states; and Indiana, Kansas, and Missouri adopted reciprocal airport legislation permitting cities to construct and operate air fields in contiguous states. Several states, among them Iowa and South Dakota, enacted air traffic laws providing greater safety for private fliers.

INSURANCE

Insurance enactments in 1947 were designed to regulate concerted practices in the insurance business as well as to regulate and control unfair practices.

Thirty-five states adopted laws to regulate concerted rate-making practices in various fields of insurance. More than 17 states passed laws to safeguard the purchasers of insurance against unfair practices in general.

HOUSING

Housing shortages, especially in urban areas, and the threatened termination of Federal rent controls led to enactments of rent control and housing laws by a number of states.

Following similar action by New York and California, among others, the Illinois General Assembly provided $20,000,000 for direct state aid to city housing and slum clearance programs. Massachusetts became the first state to authorize erection of prefabricated housing on a statewide basis directly under state control and sponsorship regardless of local building code restrictions. Minnesota authorized all municipalities to levy a special redevelopment tax to finance slum clearance. In a previous session, Indiana enacted a similar bill which applied only to Indianapolis.

A number of states in 1947 adopted or extended rent control statutes: Connecticut, Illinois, Maryland, Missouri, New Jersey, New York, Virginia, and Wisconsin.

STATE LEGISLATIVE COUNCILS

Several significant developments occurred in 1947 affecting the administrative and legislative organization of state governments. With regard to legislative organization, Arkansas, Minnesota, Ohio, Oklahoma, Utah, and Washington established legislative councils or research committees. The Oklahoma Legislative Council, originally created in 1939, was activated in 1947. Twenty-three states now have agencies of this kind. The legislative councils of Utah and Washington will function also as the Commissions on Interstate Cooperation of those states. Idaho authorized a full-time Legislative Counsel.

MISCELLANEOUS LEGISLATION

Laws increasing legislators' pay were passed in Alabama, Kansas, Michigan, Ohio, and Pennsylvania. The legislators of California and Illinois were made eligible for state pensions. Many states increased the salaries of public employees. Also in 1947, retirement systems for public employees were set up in New Mexico, North Dakota, Tennessee, Texas, and Washington.

Among numerous state administrative reorganizations was the establishment of a Game and Fish Department in Oklahoma; the creation of a Veterans' Affairs Commission in Texas to replace the Veterans' Service Officer; and the formation in Washington of a new State Parks and Recreation Commission. Activities of development agencies were expanded in several states. Minnesota formed the Department of Business Research and Development; Nebraska created the Division of Nebraska Resources in the Department of Agriculture and Inspection. In California the new State Conservation and Planning Board replaced the Reconstruction and Reemployment Commission.

Finally, in the realm of conservation and resource development, Massachusetts, Rhode Island, and Connecticut approved a new Interstate Water Pollution Control Compact. Washington, Oregon, and California adopted a Pacific Marine Fisheries Compact, and Florida and Alabama approved a Gulf Coast Marine Fisheries Compact.

NATIONAL AND INTERSTATE RELATIONS OF THE STATES

By Frederick L. Zimmermann

Research Director, New York State Joint Legislative Committee on Interstate Cooperation

---

CHANGE IN AMERICAN FEDERALISM

During the past 15 years there has been a marked change in American federalism. Emblematic of this change has been the shift as to the means for determining the relative roles of the national and the state governments. The Supreme Court has retreated from its formerly broad role as arbiter on constitutional grounds, and Congress has been playing an increasing part in making such determinations in accordance with political and pragmatic considerations. On the one hand, judicial interpretation has been freeing the national government in the exercise of its powers and functions from any broad restraints based on narrow constitutional interpretation. On the other, the Court has tended to widen the field of possible state action by confining its limitations on such action drawn from negative implications of the Constitution. The mechanistic concept of a federalism with a rigid segregation of powers and functions is giving way to a more flexible federalism. This trend is a recognition of the basic reality that today functions of government are seldom confined in their administration to one level of government and that the great need is the development of intergovernmental cooperation and integration to secure the most effective administration of those functions.

In its role as an increasingly important forum for the determination of the relative role of the nation and the states in American federalism, Congress, in recent years, has made a number of important decisions. These have been outlined in previous articles on this subject. In some instances, Congressional determination has been negative in refusing to extend direct Federal action. In others, Congressional action has taken a more positive form in that it has established cooperative machinery of the traditional type involving both the Federal and state levels or expressed in definite fashion its decision that a field of government activities is to be administered by the states. In general, however, it is significant that Congress has been reluctant to broaden the scope of direct Federal action. In fact, in some instances, the scope of direct Federal action has been narrowed and replaced by a broader role for the states. In a sense, it might be said that Congress is at present providing a check upon the expansion of direct national action very similar to that of the Supreme Court in the period that ended in the middle thirties. However, Congress is able to express its decision in a more affirmative and positive fashion than was possible in judicial interpretation, as is illustrated by the enactment by Congress of specific consent to state action in the instances of the coverage of maritime workers and, particularly, with respect to the regulation of insurance. The 1945 legislation by which Congress indicated its will that insurance be regulated by the states, following the decision of the United States Supreme Court that insurance was commerce and could be regulated by the national government under its powers over interstate commerce, embodied an outstanding development of the so-called "consent of Congress doctrine" which students of constitutional law consider an indication of the trend of the Court to a broader and more flexible interpretation of the Constitution and a device of marked potentiality in the development of a more cooperative federalism.

While these events have been encouraging to those who have advocated the use of the methods of cooperative federalism and defended the role of the states as against further expansion of direct national action, it must be pointed out that the ultimate success of such intergovernmental coordination and the eventual position of the states in the Federal System will depend in the last analysis on the effectiveness of the states in assuming their responsibilities and upon the establishment of effective channels of intergovernmental cooperation. Public opinion, at the moment, seems to be opposed to centralization, but that opinion in the end will demand effective government. Any evaluation of the present relationship of the national and state levels of government in the American system must consider the degree to which the states are assuming their responsibilities in the cooperative pattern and the extent to which it has been possible to establish machinery for coordination. This is the more clearly indicated when it is remembered that lately there has been a tendency in national legislation to withhold Federal action upon the condition and to the extent that there is effective state action, as in the Federal insurance and airport legislation and as provided in proposed Congressional legislation in other fields, such as forestry and pollution. But whether the condition is specified or not, lack of effective state action will eventually mean the assertion of more direct national control.

THE COUNCIL OF STATE GOVERNMENTS

The leading organization concerned with the implementation of a pattern of cooperative federalism is the Council of State Governments, a joint organization of the state governments completely supported by them. The progress which has been made towards a more closely integrated pattern of intergovernmental relationships in the United States has received major impetus from the existence and activities of this organization. The Council, as established in 1935, has as its basic units the State Commissions on Interstate Cooperation, the official negotiating agencies of their respective governments in national-state and interstate relations. Generally, these bodies follow the pattern originally envisaged in that their membership includes representatives of both houses of the legislature and of the executive branch in order to secure integration within the state government in its negotiations with other governments. Limited at first principally to the states of the northeast, the establishment of such agencies spread gradually to other states. However, initiative and activity on the part of such agencies has not developed in all states to the degree originally planned, and the Council is now making efforts to secure a greater role for these Commissions in those states where there has been little activity.

The early years of the Council were devoted largely to the slow and laborious work of building the machinery of cooperation, effectuating financing by the state governments, and initiating efforts for interstate cooperation. Its early efforts for intergovernmental coordination were confined almost entirely to the interstate aspects. In the period just prior to American entrance into the war, the Council had become sufficiently well established to devote attention to the problem of national-state relations, a basic necessity that was now sharply underscored by the impact of war. Besides the organization embodied in its pattern of Commissions on Interstate Cooperation, the Council had also succeeded in grouping together the most important organizations of state officials, National Association of Attorneys General, Association of Secretaries of State, and Governors' Conference, one of the older agencies for interstate cooperation. Recently, an organization of state budget officials joined this group associated with the Council. With Congress assuming a large part of the role of umpire of the federalism and in view of the strains of the war period upon that Federal System, it became necessary for the Council to represent the position of the states at Washington. Not only has the Council of State Governments come to be regarded as the spokesman for the state level of government at Washington, but as previously indicated, it has been notably successful in that role. During recent years, the principal emphasis of the Council has been on Federal-state relations. It is significant that the Governors' Conference, which previously had been a comparatively innocuous organization, has now become, in association with the Council, the spearhead for expressing the viewpoint of the state governments in their relationships with the national government. In the last few years, a new aspect of the development of the Council of State Governments has become apparent. Since success in maintaining the relative role of the states in the Federal System was so largely dependent on the effectiveness of the state governments in handling the responsibilities they sought, it was quite natural that the attention of the Council should be directed towards improvement of those governments. Accordingly, the Council is now developing into a central agency of the states for investigation, information and recommendation as to the improvement of state government itself. In other words, to the Council's role as the agency of the states in interstate and national-state relations has now been added the role of agency for intrastate improvement. There is no doubt as to the general success and achievements of the Council of State Governments, but it is evident that the scope of its activities are and must necessarily be extremely broad. To achieve the full degree of success in the functions it is seeking to perform, its staffing and consequently its financing must be correspondingly broadened.

As has been outlined in previous articles on this subject, one result of the need during the war period for more effective coordination between the national and state levels of government was the establishment of a more institutionalized channel of national-state communication as embodied in the Committee of State Drafting Officials of the Council of State Governments and the Federal-State Relations Section of the Department of Justice. In essence, this provided a procedure by which the Federal-State Relations Section receives proposals which Federal agencies wish to call to the attention of the states for state legislative consideration. These proposals are considered by the Council's Drafting Committee of State Officials which may ultimately clear them for recommendation to the states by the Council of State Governments. Similarly, the Council of State Governments could forward state proposals requiring Federal cooperation through the Federal-State Relations Section for reference to the appropriate Federal agencies. It should be stated that this machinery, originally devised to meet a wartime need, clearly demonstrated its utility as a media for the normal demands of peacetime legislation. The legislative proposals which it has recommended have been widely enacted by the states. Besides the shift in emphasis from war legislation to more normal and permanent matters, another shift in emphasis would seem significant. The programs of state legislation sponsored by the Council of State Governments are tending to be more largely comprised of measures initiated by the states through the Drafting Committee of State Officials.

FEDERAL-STATE RELATIONS

One of the most prominent mechanisms for Federal-state cooperation is the use of Federal grants-in-aid. The Council of State Governments and the Governors' Conference have insisted that grants-in-aid should be channeled through the state governments rather than made directly to local subdivisions. On the other hand, the Council, of course, has preferred the grant-in-aid method to direct Federal action. In general, the Council has argued for the use of the extant machinery of government rather than the creation of new, parallel, and duplicating machinery.

In 1946, Congress made three major additions to the pattern of Federal grants-in-aid: school lunch, hospital, and airports legislation. Two of these, school lunches and hospitals, followed the normal pattern of grant-in-aid in that they were channeled through the state governments in large part.

AIRPORTS LEGISLATION

The airports legislation varied from that pattern, in that it provided that grants could be made directly by the Federal Government to political subdivisions of the states without reference to state aviation agencies or state airport programs. However, in the course of passage of the legislation, the states as represented by the Council of State Governments, were successful in amending it to this effect: "Nothing in this act shall authorize the submission of a project application by any municipality or other public agency which is subject to the law of any state if the submission of such project application by such municipality or other public agency is prohibited by the law of such state."

Accordingly, the Council has urged all states, not only to expand and perfect their aviation agencies, but to enact legislation specifically requiring that Federal grants-in-aid for airport construction shall be expended in a state only upon receiving the approval of state aviation agencies. The Executive Director of the Council of State Governments reports that a majority of the states have enacted laws which require the channeling of grants-in-aid through state agencies. Some of these, however, are hybrid in that they set up different rules for large cities and smaller units, reflecting in this regard the basic struggle over the airports legislation between the states and the large cities. It should be noted that the Federal Airport Act is being severly criticized and that the Council has been advocating legislation in Congress which would require the channeling of Federal grants-in-aid for airports through state governments.

HOSPITAL GRANTS-IN-AID

The National Hospital Survey and Construction Act, designed to assist the states in planning for and providing the modern hospital and public health facilities on the comprehensive scale needed to serve all groups of the population, also necessitated the passage of legislation by the states. In this connection, the Council recommended two measures for state enactment: State Hospital and Construction Act which included provisions to satisfy the requirements of the Federal law, and a state hospital licensure act which, while not specifically required by the Federal law, was devised as perhaps the best method of meeting the requirement in the Congressional enactment that "if any state prior to July 1, 1948 has not enacted legislation providing that compliance with minimum standards of maintenance and operation shall be required in the case of hospitals which receive federal aid under this title, such states shall not be entitled to further allotments ...."

A large number of states took action with respect to these matters. In some states present state law may have been deemed adequate. The State Hospital and Construction Act was adopted by Arizona, Arkansas, California, Colorado, Illinois, Idaho, Iowa, Kansas, Montana, Nebraska, Nevada, New Mexico, Ohio, Oregon, Tennessee, and Texas. Seemingly, the states are meeting their responsibilities under the hospital grant-in-aid program. Plans of 23 states have been approved by the Federal Public Health Service, and seven additional plans have been received and are in process of review.

SCHOOL LUNCH PROGRAM

In connection with the school lunch grant-in-aid program, the Council recommended the enactment of state legislation in those states where extant state law was inadequate to meet the requirements of Congressional legislation. A number of states have enacted the model state school lunch act. It is significant in the instance of this program, however, that the Congress may not be satisfied with state action in this field. A Congressional conference committee report on the appropriation to carry out the provisions of the national school lunch act for the fiscal year 1948 contained the following paragraph:

"The conferees on the part of both the House and the Senate have agreed to direct attention to the fact that in the consideration of funds for the school-lunch program they have emphasized that it is essentially a local program and that the States have not done their full share in complying with the spirit of the matching provisions contained in the National School Lunch Act. The conferees of both Houses have also agreed to direct attention to the fact that it has been repeatedly asserted that many State legislatures have adjourned without taking action to provide funds in the nature of contributions to the school-lunch program. The conferees on the part of both Houses desire to make it abundantly clear, therefore, that in connection with a reexamination of this matter for the fiscal year 1949, they are now placing the respective States on notice with respect to their obligations under this program and that failure of the State legislatures to act in the premises will have no effect in determining the future requirements of this program."

THE FEDERAL POSITION

Probably the outstanding question in the immediate future of Federal-state relation is that of Federal grants-in-aid. The present Federal grants-in-aid program has long been criticized on the grounds that it was not systematic nor related, but had developed in an *ad hoc* fashion with respect to certain problems of government in response to pressure for action on the particular problems involved. On the Federal side, a congressional committee, during the last session, pointed to the present amount of grants-in-aid and the substantial increase in the amounts of Federal monies expended for this purpose and alleged that the state governments were in better condition with respect to their fiscal affairs than the Federal Government. The committee also pointed to the lack of uniformity in the various methods of apportioning aid under grants-in-aid legislation.

POSITION OF THE STATES

On the state side, the Governors' Conference and the Council of State Governments have been pressing for a reappraisal of the whole present program of grants-in-aid, pointing out, on the one hand, that the programs have no relation to each other, with the result that there is a different policy, program, and administrative procedure with respect to almost every activity, and the net result is overlapping, duplication, and confusion. The Council has undertaken a study of the whole question of grants-in-aid and plans to establish a continuing committee to work with Federal departments and agencies in an effort to bring order to the Federal-state relations involved in grants-in-aid. This issue may well assume major importance in the immediate future of Federal-state relations.

STATE ATTITUDE IN UNEMPLOYMENT INSURANCE

In this connection, the attitude of the states, as expressed by the Governors' Conference, with respect to unemployment insurance is significant. In the present system of administration of unemployment insurance, state unemployment insurance systems are financed by a payroll tax which Federal law permits to be used as a set-off to the extent of 90 per cent of the Federal payroll tax for this purpose. The 10 per cent collected by the Federal Government is levied for the purpose of raising revenues for the administration of workmen's compensation, but goes directly into the Federal treasury and is appropriated to the states by means of grants-in-aid for the administration of unemployment compensation.

The states have been bitterly critical of this procedure. They argue that the national Social Security Agency does not allocate adequate funds to permit efficient and economical administration of unemployment compensation and that the Federal Government has built up over the period of the past 12 years a surplus of approximately $700,000,000 out of the segregated tax. The Governors' Conference and the Council of State Governments in 1947 urged that, since unemployment compensation and the employment service programs are administered by the various states, and the Federal tax on employers is levied for the purpose of raising revenues for such administration, the revenue collected thereunder should be allocated among the several states. It is recommended that the states be granted 100 per cent rather than a 90 per cent set-off against the Federal tax for the purpose of providing both benefits and administrative costs under the unemployment compensation act. This, of course, would necessitate adjustments to protect that limited number of states which would thereby receive less revenue than is adequate to cover necessary administrative costs.

It was contended that such adjustments would readily be made for an indefinite period from the surplus which had already accrued to the Federal Government during the past 12 years. In this same field, it is notable that the President's reorganization plan, which would transfer the United States Employment Service permanently to the Department of Labor where it is now temporarily located, was disapproved by the Congress upon the representations of the officials of 33 states who urged the return of the U.S.E.S. to the Federal Security Agency on the grounds that it was inefficient to separate Federal placement activities from the unemployment compensation activities of the Federal Security Agency, particularly when at the state level the two activities are merged. They argued that the proposed reorganization would require state administrators to deal with two separate sets of Federal officials.

TAXATION

Another major problem, that of overlapping taxation, it now seems may be the subject for definite action within a reasonable period. However, it must be admitted that previous attempts to meet this important problem have made little progress. The Council of State Governments emanated from efforts toward this end by the American Legislators' Association when, in 1933, that organization created the Interstate Commission on Conflicting Taxation. Since that time, the efforts of the Committee on Taxation of the Council of State Governments, the Committee on Intergovernmental Fiscal Relations established in 1941 by the U. S. Treasury Department, and the joint committee established by the National Tax Association and the American Bar Association have achieved little in terms of results translated into governmental action. The problem, in the meantime, has been growing steadily worse. Municipalities are financially hard pressed. In 1946, it was estimated "90 per cent of total federal and state tax collections, exclusive of payroll levies, came from sources used by both these levels of government." This problem may well be sharpened by the greater need of states for more revenue in the immediate future. While the states generally have reduced their debts and in many cases have built up sizable surpluses and while state tax revenue rose again in the fiscal year 1947, the pressure of preferred expenditures may, in relation to other possible economic factors, compel the states to seek greater revenues.

In 1947, however, for the first time, representatives of the state governments and the national Congress came together for the purpose of initiating steps toward some agreement on this problem. Following a preliminary meeting in March between a special committee of the Governors' Conference and members of the Ways and Means Committee of the House of Representatives and the Finance Committee of the U. S. Senate, representatives of these groups met in an initial conference under the auspices of the Council of State Governments in September. The conference agreed to a group of definite recommendations, namely:

> "1. That the federal government should reduce federal excise taxes as soon as practicable (special consideration should be given to local telephone calls, intrastate electric energy, gasoline and admission taxes);
>
> "2. That the federal government should amend inheritance and estate taxes to provide more equitable division of this revenue between the federal government and the states;
>
> "3. That the federal government should relinquish to the states the federal tax on employers levied to cover the administrative expenses of the state employment security programs, and the states will assume the responsibility for the administration of the unemployment compensation and employment service programs;
>
> "4. That the Congress take the earliest possible action to correct by federal law the income tax inequities existing between the community property and the non-community property states;
>
> "5. That the states should avoid encroachment upon tax fields which are peculiarly adaptable to federal uses."

It is planned that this first meeting will be followed by others in an effort to achieve an even broader area of agreement. The meeting marks a step in advance in this field, first, because members of the pertinent committees of the national legislature are taking part in the effort and, second, because the effort is being jointly participated in by both levels of government. Moreover, it is, in itself, a recognition of the importance of the Council today in Federal-state relations. Recognition of the role of the Council at the national level of government was also indicated by the fact that the Council was the governmental agency requested to serve on the Senatorial Council charged with revision of the Social Security program in the United States and that at the request of Federal officials it has undertaken a study of Federal-state relations as a part of the overall project for the reorganization of the Federal Government.

While the Federal-state aspects of the problem of intergovernmental conflict in the field of taxation are a responsibility of both levels of government and, realistically, primarily of the national government, the states have clear responsibility in the interstate phases of the problem. It must be admitted that the progress of the states towards the solution of these interstate problems has not been satisfactory. While the Council of State Governments, in 1947, following a recent decision of the Supreme Court which limited constitutional restrictions on multiple state taxation of air carriers, recommended the enactment of a model law on that subject by the states, seemingly only two states have so far enacted the recommended legislation designed to clear up questions of multiple taxation, with respect to air carriers. Similarly, though a regional conference of the northeastern states in 1941 and the National Conference of Commissioners on Uniform State Laws recommended model measures for the compromise and arbitration of disputes as to so-called "double domicile" questions in inheritance taxation, progress has been limited. However, a recent survey of state enactments in this field showed that a large number of the states represented in the original regional conference had enacted at least one of the two measures proposed, and there seems some chance that efforts in this field will be shortly resumed.

INSURANCE

Probably one of the most important tests of state effectiveness in the Federal system is that involved in insurance regulation. It will be remembered that in 1944 the United States Supreme Court held that insurance is commerce and that it comes within the purview of Federal regulation under the commerce clause of the Constitution. This decision threw into doubt the whole system of state regulation that had been built up on the basis of judicial interpretation over a period of 75 years to the effect that insurance was not commerce and was, therefore, subject to state regulation. Early in 1945, Congress enacted legislation in which it stated its intent that insurance should be regulated by the states and granted a moratorium on the operation of the Sherman Act, Clayton Act, Federal Trade Commission Act, and Robinson-Patman Anti-Discrimination Act until Jan. 1, 1948, and provided that after that date those laws were to be applicable to the business of insurance to the extent that such business is not regulated by state laws.

Committees of the National Association of State Insurance Commissioners and the Council of State Governments and a so-called "All Industry Committee" representative of the various divisions of the insurance business undertook to prepare state legislation to meet the requirements of the Federal act. Their efforts were directed in the main towards two objectives: establishment in the states of the machinery for state regulation of rates and enactment in those states, where such provisions did not already exist, of fair trade legislation applicable to the insurance business. In 1947, Congress extended the moratorium until June 30, 1948.

It seems evident that the states have made considerable progress during the "legislative" year of 1947 when 47 state legislatures were in session. The Committee on Insurance of the Council of State Governments reports the result as follows:

"Among the states, 35 states enacted rate regulatory laws in 1947. The laws adopted by 15 states—Arkansas, Connecticut (replacing 1945 law), Georgia, Illinois, Iowa, Kansas (fire only), Minnesota, Nebraska, Nevada, New Mexico, North Dakota, Oregon, South Carolina, South Dakota (replacing 1945 laws), and West Virginia (certain fire and marine fields)—follow closely the bills proposed by the NAIC—All-Industry Committee, according to a recent study by the Insurance Law Section of the American Bar Association. In another 14 states, laws adopted follow the proposed bills with certain variations—Arizona, Colorado, Delaware, Idaho (fire), Indiana, Maine, Massachusetts, Michigan, New Hampshire, Ohio, Pennsylvania, Utah, Wisconsin, and Wyoming. Laws adopted in 6 states—California, Florida (supplementing 1945 law), Montana, New Jersey (supplementing 1944 law), Vermont (adding casualty regulation), and Washington—provide for different patterns of rate regulation. In addition, casualty and surety rate regulatory bills were pending in Missouri when the 1947 session adjourned.

"As a result of rate regulatory legislation in 1947 and preceding years, 43 states have enacted laws applicable to the casualty and surety business, and even more have adopted laws applicable to the fire and marine business.

"Seventeen states—Colorado, Connecticut, Delaware, Florida, Indiana, Maryland, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Mexico, New York, South Carolina, Vermont, Washington and Wisconsin—substantially adopted the accident and health regulatory bills drafted by the NAIC—All-Industry Committee group.

"The Insurance Committee recommended strengthening of state regulation of unfair practices in the insurance business, along lines indicated by the joint proposals of the NAIC and the All-Industry Committee. Fifteen states—Florida, Indiana, Maryland, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Jersey, New Mexico, Pennsylvania, South Carolina, South Dakota, Tennessee and Wisconsin—adopted laws based on these proposals. In addition, Utah and Washington covered the field of unfair practices in new insurance codes enacted in 1945. More than a score of states had unfair practice laws applicable to insurance on the statute books prior to 1947.

"The states have given concrete evidence of their intention to maintain their traditional jurisdiction in the field of insurance regulation. Almost all of them have made the important decisions of policy as to the lines along which such regulation will be carried on in the future. And they have legislatively outlined the procedures to guide the administration of these policies."

While the states have made considerable progress towards providing the necessary legal structure to meet the requirements of the Federal legislation, it is more dubious as to whether state administration will meet those requirements, in that many states are not adequately equipped for the technical work involved in rate regulation. The Council of State Governments is now devoting attention to this problem and is considering several methods of achieving the objective through interstate cooperation. One method would be to divide specific functions among operating states and to share the results on an informal basis. Another would be for a few states to undertake the technical work and the other states to borrow or purchase the results. A third method would be the use of the interstate compact procedure to set up a central interstate agency for rating purposes.

Seemingly, the next phase of state efforts in this field will be directed towards this problem of administration.

NATURAL RESOURCES—FORESTS

The recent reappraisals of the forest situation in the United States by the United States Forest Service and the American Forest Association were in basic agreement on the serious depletion of American forests and the excess of drain on sawtimber over annual growth. While there was agreement on the need for action, state control as against Federal control of the cutting of timber on privately owned forest lands emerged as the dominant issue of discussion at the American Forest Conference in October 1947. Federal officials suggest legislation at the national level which would give the states a reasonable time in which to establish by state law the regulation of harvesting methods applicable to private forest property, but under a Federal standard of forest practice that would be subject to Federal supervision and enforcement. In the event that a state failed to act within that period, the Federal Government would be empowered to step in and regulate directly. Labor has been advocating even more direct Federal regulation, while the states have been urged by the Forestry Committee of the Council of State Governments to enact state regulatory legislation for this purpose. While some states, such as Maryland and Oregon, have enacted regulatory legislation and while others, such as New York, have tried to approach the problem through efforts to secure the cooperation of the private landowner, it must be said that on the whole the state action so far taken would seem insufficient to meet the needs of a serious if not a critical situation.

In the meantime a demand has arisen from the public land states of the West that Federal lands in those states be transferred to state administration. This was activated by pressure groups who feel they would benefit from such transference. It was also related to the problem of Federal payments in lieu of taxation which Congress has not as yet solved in any concrete fashion and to the feeling in the so-called public domain states that the economic development of those areas is being retarded by Federal land ownership.

LAND UNDER NAVIGABLE WATERS

A similar issue was at stake with respect to the ownership of land beneath navigable waters. It will be remembered that Congress passed legislation in which it asserted that the states owned the land under such waters following the raising of the issue with respect to the oil under the marginal sea off the coast of California, but that the President vetoed the Congressional legislation on the grounds, in part, that the Supreme Court should be given an opportunity to pass upon the issue in the case that had already been initiated before that body. More recently, the Supreme Court decided in favor of the Federal Government (*United States vs. California,* 67 S. Ct.1658) and in its opinion stressed the need for paramount national powers with respect to such land for the purposes of national defense and international affairs. As a consequence of this decision, the Council of State Governments, the Governors' Conference, and particularly the Association of Attorneys General will press for legislation in the forthcoming session of Congress which will have the effect of restoring state jurisdiction over these matters. The decision of the Court recognized that the ownership of tidelands is still a question that Congress may decide.

RIVER DEVELOPMENT

In the field of water resources Federal flood control and rivers and harbors legislation enacted since 1944 has provided for Federal-state consultation and cooperation in the planning of river development as demanded by the states in the struggle in Congress at that time. All of the states have created agencies or designated officials to maintain contact with Federal agencies in accordance with the concepts of this legislation. A Federal interagency river basin committee has been established, comprised of representatives of the pertinent Federal agencies with the purpose of providing a means of exchange of information and coordination of activity among Federal agencies and the maintenance of liaison with regional interagency committees, such as those which are operating in the Missouri and Columbia Basins. In response to suggestions by the Council of State Governments, the Federal committee on its side has created a group to maintain state liaison, while the Council through its Washington Office maintains a channel of immediate communication with the Federal committee.

In 1946, at the request of the Missouri River States Committee, the Council worked with representatives of the four states of the lower Missouri River Basin—Iowa, Nebraska, Missouri, and Kansas—to develop ways and means of enabling those states to comply with the requirements of the Flood Control Act of 1944 with respect to public works for flood control. Recommendations for suggested legislative action were developed and transmitted to the proper officials and agencies in the four states. During their 1947 legislative sessions, Kansas, Iowa, and Nebraska enacted legislation including the recommended authorizations. On the state level, the Water Resources Committee of the Council has undertaken a summary of all state laws on this subject with a view to formulating recommendations for state action.

POLLUTION ABATEMENT

The long continued struggle in Congress over the shape which Federal pollution legislation should take with Federal agencies leaning towards more direct forms of action and the states in the main favoring Federal grants-in-aid, more or less in the traditional pattern, may be reaching a compromise that can be enacted. The Barkley-Taft bill passed in 1947, includes provisions for grants-in-aid and for Federal interest-free, second lien loans for engineering work. Federal enforcement of pollution abatement orders would be provided only after efforts by state authorities had been exhausted and then only with state consent. On the state level, considerable progress in the enactment of pollution abatement legislation has been made during the past few years, notably in the instance of the legislation passed in Pennsylvania, Rhode Island, and Virginia. Three of the New England States entered into a compact establishing an interstate agency designed to develop measures for the New England area and to recommend appropriate action to the member state.

An unfavorable situation with respect to joint state action as to a river basin exists in the case of the Delaware. While the Interstate Commission on the Delaware River Basin has been largely successful in securing agreement on pollution abatement for that river, which, following action by Philadelphia, is now in the process of being translated into actual results, the agreement among New York, New Jersey, and Pennsylvania with respect to the allocation of the waters of that river has run into difficulty seemingly because of differences between the Attorney General of New York and the Attorneys General of the other states.

HIGHWAY SAFETY AND MOTOR VEHICLE REGULATION

In the field of highways and motor vehicle regulations the states were severely criticized during 1947, particularly with respect to the inadequacy of state regulation relative to safety. The President in his address opening the Second President's Highway Safety Conference, in June 1947, applauded the decline in the highway fatality rate and said that the states have made unusually good progress in the field of safety education, but pointed out that the driver license part of the program was not keeping pace and that the states had reported little or no progress during the year since the previous conference in raising standards of motor vehicle administration. The President said that, while there was no desire on the part of the Federal Government to encroach upon state jurisdiction in this field, Congress would not stand idly by in the face of the grievous national accident toll. On the state level, the northeastern region, through its Annual Highway Safety Conferences, continued to make progress towards the goal of greater uniformity in state motor vehicle laws and greater traffic safety. Continuing committees of that Conference are studying the questions of motor vehicle reciprocity, uniform pavement marking, and uniform truck registration. During the year, the Regional Conference developed a series of recommendations with respect to uniformity of state provisions relative to school buses in an effort to limit the accident toll in connection with these vehicles.

INTERSTATE COOPERATION

The interest of the Council of State Governments and the Governors' Conference in recent years has centered principally on the problem of Federal-state relations and, consequently, on the improvement of state government. While it is becoming increasingly difficult to segregate fields of intergovernmental relations because of the tendency for any particular function of government to become the concern of all levels of the American governmental structure, there are problems and methods which may be denoted as interstate because they primarily are concerned with integration of that character.

Projects of interstate cooperation have continued to develop, some of them under the aegis of the Council, and, interestingly, a number of them without the sponsorship of that machinery for interstate cooperation which is collectively designated as the Council of State Governments. It is probable, as may be discerned in what has been reported as to Federal-state relations, that solution of some Federal-state problems will require further development of interstate coordination. In addition, the activation of the Commissions on Interstate Cooperation in more states and the reorganization of the regional groupings of those Commissions as now being undertaken by the Council may increase the initiation of projects of interstate cooperation on the regional level, a result that would seem very desirable since it was the success of such regional activity in the northeast that rooted interstate cooperation firmly in that region before the Council had achieved its present prominence in the national scene.

The relationship which has been established between the Council of State Governments and that older and more limited organization for interstate cooperation, the National Conference of Commissioners on Uniform State Laws, seems to have attained a fairly permanent basis. In essence, that relationship recognizes the National Conference as an initiating and drafting body for uniform state laws, while the Council acts as the agency for securing enactment of the recommended measures through the state cooperation commissions. In the past, the weakness of the Uniform Law Commissioners has been their failure to secure adoption of their proposals due to the lack of close relationship of their organization to the legislative bodies of the states. Since the development of the present teamwork between the Council and the National Conference the ratio of adoption of recommended uniform measures has been increased to a marked degree.

At the 1946 Annual Conference of Commissioners on Uniform State Laws, commissioners from 30 states and the District of Columbia made reports and presented plans for the 1947 legislative sessions. In those sessions, 80 uniform or model acts were introduced and 42 adopted. In 1945, 83 acts were introduced and 45 adopted. In 1943, 162 acts were introduced, of which 80 were adopted. In 1941, the score was 201 and 80. In summation, it would seem that greater progress is being made with respect to the adoption by the states of uniform laws as recommended by the National Conference.

INTERSTATE COMPACTS ON FISHERIES

The use of the interstate compact, proposals for its use, and the range of proposed subject matter seems to be steadily growing. In this connection, it should be remembered that, until the First World War, use of these interstate treaties permitted by the United States Constitution, subject to the consent of Congress, had been extremely limited. On the Atlantic coast, the Atlantic States Marine Fisheries Commission, established by compact among 14 states continued to make progress towards better integration of state regulation of the marine, shell, and anadromous fisheries of the Atlantic Seaboard. The Commission is considering two proposals for amendment of the original compact to meet the need for further coordination of state action in that area.

The Pacific Coast states of California, Oregon, and Washington established similar cooperative machinery in 1947 by a compact which was ratified by Congress. It is significant that an amendment to the Congressional ratification act designed to assure the presence at meetings of the Pacific Marine Fisheries Commission of representatives of the Federal Fish and Wildlife Service was rejected by Congress after protest by the compacting states. Similarly, the legislatures of Florida and Alabama adopted a Gulf Coast Compact of similar design. Texas failed to act.

A joint commission appointed by the Governors of Virginia and Maryland has recommended the establishment of joint regulation of the fisheries of the Potomac River and the Chesapeake Bay under a compact between the two states for that purpose.

OIL COMPACTS

Legislation was enacted to extend Congressional consent to the Interstate Oil Compact for another four years until September 1, 1951. During 1947 Indiana and Tennessee became the 18th and 19th member states of this Interstate Compact Commission which in its state membership now represents 90 per cent of the gas and 80 per cent of the oil production of the United States.

POLLUTION CONTROL COMPACTS

Massachusetts, Rhode Island, and Connecticut ratified the New England Pollution Control Compact in their legislative sessions and Congress granted its consent. The compact establishes an interstate agency to consider plans and procedures for the abatement of pollution in the New England region and to formulate recommendations to the compacting states. It envisages ultimate ratification by Maine, Vermont, and New Hampshire in addition to the present member states and membership by New York with respect to those boundary waters now already governed by extant pollution compacts. The Interstate Sanitation Commission, established by compact among New York, New Jersey, and Connecticut, with authority to abate the pollution of the waters of New York harbor and adjacent areas, took a significant step during the year. Previously, this Interstate Commission has sought to achieve its purposes through persuasion; now for the first time it has brought an action against some New Jersey municipalities to compel them to meet the standards of the compact.

SUPERVISION OF PAROLEES AND PROBATIONERS

Probably one of the most noteworthy compacts in the history of the American union and certainly the one including the most states is the Interstate Compact for the Supervision of Parolees and Probationers. The compact has been ratified by 41 states. Missouri and South Dakota were the most recent additions. The compact provides means of granting probationers and parolees the privilege of moving outside the state in which they were sentenced and into other jurisdictions where they may have better opportunities for adjustment and establishes supervision of such persons by the state into which they move. All legal requirements for extradition are expressly waived by the states under the compact and by the parolee under a waiver of extradition which is made a condition of his transfer to another jurisdiction.

The Council of State Governments acts as secretariat for the Association of Administrators of the Interstate Compact for the Supervision of Parolees and Probationers which was formed in 1945 to provide a means through which interpretation of the compact and administrative policy and coordination could be acted upon through some continuing central medium. Through the work of this organization, rules, regulations, and forms to standardize operations have been provided and are in use by the compacting states. A reporting system was developed and used for the first time in 1947. Thirty-eight of the 41 states have developed the methods and procedures necessary to supply comparable statistics. It is reported that 5,702 parolees were under cooperative supervision on Oct. 1, 1947.

JOINT STATE WELFARE INSTITUTIONS

There are several recent interesting proposals for the use of the compact method. Under the aegis of the Council of State Governments, the states of the western mountain region have been considering the use of interstate compacts as a means of establishing joint state institutions in the welfare field instead of each state endeavoring to maintain its own institutions for each purpose. Definite progress has been made on this proposal by the states. A similar plan is being advocated in the South for the establishment of regional institutions of higher learning.

MILK COMPACTS

Another proposal, sponsored by the milk producers marketing in the New York Market area comprising New York City and Westchester, Nassau and Suffolk County would have established an interstate board by compact among the five states of New York, New Jersey, Pennsylvania, Massachusetts, and Vermont. This body would have the power to fix the prices to the producers in those states for milk destined to the New York Market area in the event that the present joint regulation of this subject by the national government and New York State through marketing orders lapsed. Legislation to permit milk administrators to sign this compact was enacted by Vermont and Pennsylvania. The pertinent administrative officials of New Jersey and Massachusetts signed the document under the authority of old statutes. Because of the use of administrative ratification, questions have been raised as to whether this is an interstate compact in the usual meaning of that term.

STATE CONSTITUTIONS, REFERENDA AND INITIATIVES

By Edwin O. Stene

Associate Professor, University of Kansas

GENERAL

A relatively small number of states make a practice of holding state elections, either general or special, in odd numbered years. Of the 11 states that voted on constitutional or other questions in 1947, all had done so also in at least one of the last five "off-years." On the other hand, only ten states not included in the 1947 list have voted on legal questions in off-years during the past decade, and only four of these have repeated the practice on two occasions or more. Georgia and Missouri, frequently among the "off year" states in the past, were missing from the most recent list, apparently because of their new constitutions adopted in 1945.

The number of questions voted on (30) was the same as in 1945 (in 12 states), but the kinds of questions and methods of initiation were more varied. One constitution was adopted, and two states voted on the question of holding constitutional conventions. Eighteen constitutional amendments were voted on, 17 having been submitted by legislatures and one by initiative petition. One legislative measure was referred to the voters by petition; four bond issues and three other legislative measures were referred by legislatures. One question was referred by a state legislature for an advisory referendum.

In addition to these 30 questions, four amendments were proposed by the legislature of Connecticut to be voted on at town elections. However, the voting process continues into the following year and so these measures are not included under the heading of action taken in 1947.

Only five of the 11 states held their elections on the traditional second Tuesday of November. Wisconsin's vote was taken on April 1 and Michigan, April 7. Rhode Island held its election on June 23; Texas and Alabama, Aug. 23 and 26, respectively; and Oregon, Oct. 7. New Jersey held two elections, June 3 and Nov. 4.

On the whole the measures that were submitted met with relatively favorable reception from the voters. Only two constitutional amendments were defeated, and two legislative measures, one of the latter after a referendum petition and the other on reference by the legislature. In addition, the voters of Kentucky refused to call a constitutional convention, and the Wisconsin electorate "advised" the legislature not to enact a daylight savings law.

NEW JERSEY CONSTITUTION

In 1944, after having authorized the legislature to prepare and submit a new state constitution, the electorate of New Jersey followed the advice of Mayor Hague and refused to approve the constitution that was submitted to them. In 1947, a new constitution was adopted. The state acted with surprising speed, by calling a convention, holding a convention, and adopting a new constitution, all within a period of five months and a day. The question of holding the convention was submitted to the voters by the legislature, and approved June 3. The convention met almost immediately, and on Sept. 10 the new document was completed and signed by the delegates. The proposed constitution received the support of both major parties, and on Nov. 4 it was adopted by the electorate.

Perhaps the most important of the changes in the basic law of New Jersey were those that increased the authority of the governor. His term of office will hereafter be four years instead of three, and he will be permitted to serve two terms in succession. His veto power will be strengthened by the requirement of a two thirds vote in each house of the legislature to override instead of the previous majority vote; also he will have a longer period in which to consider legislative measures presented to him for approval. He will have ten days during a session, and 45 days at the end of a session. However, the pocket veto is eliminated completely, for if the governor vetoes a measure after adjournment the legislature automatically reconvenes at the end of 45 days for the purpose of reconsidering the vetoed act. The governor's administrative authority is strengthened by the provision that there shall be not over 20 executive departments, and that these departments shall be headed by single executives unless otherwise provided by law. All executive officers other than the governor will be appointed, and only two, the attorney general and the secretary of state, are given constitutional status. The state auditor will be chosen by the legislature and will be outside the executive branch of government.

Legislative terms will be lengthened

by one year, thus bringing the state into the usual pattern of two- and four-year terms. The elections will be held in odd-numbered years, however. The compensation of members of the legislature will be fixed by law.

The court system was reorganized and simplified at the top level, but the dual system is retained at the trial court levels. Judges will be subject to removal by impeachment or by action before the supreme court, and they may be retired at 70 or for incapacity. New judges will be appointed by the governor and the senate for seven-year terms. Reappointments will be for "good behavior."

Only minor changes were made in the county governments. The convention was prevented, by legislative restrictions, from altering the territorial limits of any county, and thereby from altering the representation in the legislature. Several of the traditional elective county offices were retained, but the coroners and justice of peace courts were abolished.

A few significant social and economic measures were incorporated into the new constitution. Racial segregation in schools and in the militia is prohibited. The right of labor to organize and to bargain collectively in private employments is guaranteed. In public employment, workers have the right to organize and to make grievances known.

Amendments to the new constitution may be submitted to popular vote either by a three-fifths vote of each house in a single legislature or by a majority vote in each of two successive legislative years.

NEW YORK AMENDMENTS AND REFERRED MEASURES

Exclusive of the New Jersey constitution, the longest question ballot of the year was presented to the voters of New York, who passed on six constitutional amendments and three referred legislative measures. All of the proposals were approved, some only by reason of strong support in New York City.

The most publicized constitutional amendment was the one that authorizes the creation of a state debt of $400,000,000 to provide a bonus for veterans of the Second World War. A second amendment authorizes the legislature to fix the compensation of its own members; a third extends the application of the absent voting law to primary and special elections, and simplifies its administration; and a fourth creates an additional judicial district. A Court on the Judiciary is created by a fifth amendment and is given authority to pass on the removal of judges and on their retirement for mental or physical disabilities. A sixth amendment authorizes the legislature to provide for the construction of additional ski trails in the state forest, which, in the absence of constitutional exceptions, must be preserved solely as forest land.

The three legislative measures authorize an increase in state debt in order to provide funds for loans to cities and towns for slum clearance and low cost housing programs, and increase the maximum limit on outstanding contracts for housing projects. Thus for the third successive year the voters of New York have authorized an increase in state subsidies for low cost housing.

OHIO CONSTITUTIONAL CHANGES

Ohio ranked next to New York in the number and importance of constitutional changes made in 1947. Three amendments were proposed by the legislature and one was brought before the voters through popular initiative. All were approved. Like New York, Ohio adopted a war veterans' bonus amendment and authorized a bond issue to finance the program. The rate of compensation will be $10 for each month of service in the United States and $15 for each month of foreign service, with a maximum of $400 to any one person. The second amendment submitted by the legislature alters the constitutional provisions regarding the terms of office and compensation of probate judges, and the third adds the governor and the state treasurer to the membership of the sinking fund commission. Formerly the membership included only the secretary of state, the attorney general and the state auditor.

The popularly initiated amendment follows the pattern of the "good roads amendments" adopted by several other states in recent years. Hereafter the revenues derived from motor fuel taxes and other motor vehicle fees and taxes may be used only for highway building and maintenance, traffic law enforcement, hospitalization of indigent victims of motor vehicle accidents, and for the payment of costs of administering the highway taxes and fees.

ALABAMA

Alabama, like Ohio, adopted four constitutional amendments, but three of them were local in character, pertaining to specific counties. The legislature was authorized to change the compensation of certain officers in two counties, and one county was authorized, on popular vote, to levy a tax of four mills in order to construct and operate county hospitals. The fourth amendment allocates the proceeds of the state income tax to specific uses. Income tax revenues collected after Oct. 1, 1947 must be used first to offset the loss of income due to the $2,000 homestead exemption from property taxes, after which such balances as remain are allocated to the Special Educational Trust Fund to be used for the payment of teachers' salaries.

TEXAS

Texas adopted a constitutional amendment for the promotion of higher education. By this amendment, bond issues are authorized to finance building programs at 16 institutions of higher learning. The state university and the agricultural and mechanical college are authorized to issue bonds for $10,000,000 and $5,000,000, respectively, against future revenues of the permanent university fund. For the other 14 institutions a state tax levy of one-half mill is authorized, and the governing bodies are authorized to issue bonds against their respective allocated shares of the resulting tax revenue. The amendment was approved by a margin of about 5,000 votes out of 200,000.

MICHIGAN AND OTHER STATES

The Michigan electorate approved an amendment which will eliminate the necessity of holding a non-partisan primary election for judges when the number of candidates is not in excess of twice the number to be elected, but a proposed amendment which would have increased the ten-year limit on the time that corporations are permitted to hold real estate not actually occupied in the exercise of franchise was rejected.

Pennsylvania voters also rejected a proposed amendment, this one designed to authorize an increase in state debts. The Kentucky electorate voted down a proposal to call a constitutional convention.

Three state bond issues were authorized by Rhode Island: one to finance a sewer project and the other two for the construction of buildings at the state college.

The voters of Oregon rejected two tax measures. A proposed 3 per cent sales tax referred to the voters by the legislature was defeated by a vote of almost 3 to 1, and a cigarette tax levy referred by petition after legislative enactment also was defeated. A cigarette tax had been referred and voted down in the same manner in 1945.

SUMMARY

A review of the measures voted on in 1947 reveals that half of them were concerned directly with state and local finances. Three of the amendments authorized new bond issues, and one proposed authorization was defeated. In addition, four legislative measures were bond issue authorizations. Two of the constitutional amendments dealt with the allocation of state taxes, and one with local tax limits in a metropolitan county. Two legislative tax measures were defeated on referendum votes, while two state subsidy measures were approved.

Two of the amendments dealt with the electoral process, three with judicial organization and powers, one with administrative organization, and one with legislative compensation. Two amendments of local application concerned the terms and compensation of county officials. Measures of miscellaneous character included an amendment to the New York restrictions on the use of state forest lands, a proposed amendment dealing with the rights of private corporations, and an advisory vote on daylight savings. Two states voted on state constitutional conventions. One of these, New Jersey, adopted the proposal, held its constitutional convention, and approved the new constitution which the convention prepared. That action was far and away the most important electoral decision on any question ballot before the voters in 1947.

ELECTORAL LEGISLATION

By O. Douglas Weeks
Professor, The University of Texas

GENERAL

Election laws were enacted during 1947 in 45 states. Some notable innovations were made in a few states, but most of the legislation was amendatory in character. California, Colorado, Indiana, Maryland, New Jersey, and Ohio altered their election statutes as to numerous details. Significant primary enactments were made in Rhode Island, Utah, and Mississippi. North Carolina passed a few amendments. Wisconsin created a special joint committee to study needed revisions in her electoral arrangements.

DIRECT PRIMARY—RHODE ISLAND AND UTAH

The most noteworthy enactment of the year was the substitution by Rhode Island of a statewide mandatory direct primary system for nominations by caucuses and conventions. All nominations by all parties for elective offices—national, state, district, city, and town—must be made in primaries. Party conventions may endorse primary candidates whose names are to appear first on the ballot; others become candidates upon personal declaration and by nomination papers signed by from 50 to 1,000 party voters depending upon the office. Party primaries are to be conducted separately. Primaries are "closed" by means of party enrollment; challenging is also permitted. Nominations are to be by plurality. In cases of failure to make nominations, tie votes, and vacancies, nominations are to be made by state and local party committees. State conventions, to be held biennially, are retained to nominate presidential electors and frame platforms; they are to consist of nominees for national and state offices plus one delegate elected in the primaries from each representative district. Caucuses are retained only for school board nominations. Penalties are provided for enumerated corrupt practices. Primaries are to be construed as elections.

Utah abandoned the run-off primary and provided for county, district, and state party conventions to nominate two candidates for each elective office whose names are to go on the party primary ballot. Convention delegates are to vote individually on official ballots in private booths for such candidates while conventions are in session. Their choice is limited to those candidates who have filed with the Secretary of State or the county clerk. The two persons receiving the highest vote for each office are to run in the primary as the party's candidates. Party executive committees are to be chosen in convention. The primary date was moved from July to September. Changes were also made in nominating methods for city offices.

SOUTHERN PRIMARIES

In an obvious effort to prevent Negroes from participating in Democratic primaries, Mississippi authorized state executive committees of parties holding primaries to "make reasonable rules and regulations that will insure a fair primary" and empowered county executive committees to hold new registrations of party members and to appoint assistant managers in precincts to hear complaints of challenged voters, the county executive committees to make final decisions as to persons denied participation in primaries. No person is to participate in a primary who is not "in accord with the principles of the party" as proclaimed by its state executive committee. Several other amendments were made with respect to the administration of Mississippi primaries.

Arkansas repealed the provision, adopted in 1945, for a separate primary for Federal offices, required primary candidates to file pledges to abide by the result of the primary and compelled candidates for convention delegate and county committee member to pay ballot fees before their names can go on the primary ballot. Some changes as to primary contest procedures were also made by Arkansas. The Governor of Georgia vetoed a bill which would have repealed all primary laws. Alabama amended the primary law with respect to the time of holding nominating mass meetings, the eligibility of parties to have their tickets on the general election ballot, unopposed primary candidates, and contested primary election cases. Florida provided special primaries for elections to fill vacancies. The run-off primary was made mandatory for county offices in Texas.

NOMINATION PROCEDURES

Innumerable amendments affecting primaries and nominating procedures were enacted in many states. Michigan, Ohio, and Wisconsin made a number of changes. Arizona clarified and altered provisions for the recognition of new parties. Connecticut created a new condition respecting the inclusion of party candidates on the general election ballot. Candidates for certain judgeships in Illinois may be nominated by more than one party and independently as well. Massachusetts forbade the name of a candidate for delegate or alternate to a national convention to appear more than once on a presidential primary ballot. Independent candidates registered as party members within the year before filing were barred in Nevada. Arrangements for the filing and withdrawal of candidates and for the filling of vacancies were altered in a dozen states. Massachusetts, New Hampshire, and New York required formal candidate acceptance of nominations, New Hampshire also, forbidding "straw candidates." New York forbade nomination of nonparty members unless approved by the proper party committee. South Dakota denied a governor nomination to a third successive term. California consolidated her general and presidential primaries. New York moved the convention and primary dates from September to August for 1947; Idaho the primary from June to August. A double stub for primary ballots was provided by Colorado, and North Dakota abandoned the consolidated primary ballot.

PARTY ORGANIZATION

Three changes were made in party organization in Oregon—the elimination of elected county representatives on the state executive committees, repeal of the law governing the filling of vacancies on national committees, and the authorization of congressional district committees to make nominations for special congressional elections. Arkansas added township representatives in county conventions.

Payment by the State Treasury of the actual traveling expenses up to $200 of delegates to national conventions who actually attend was provided by North Dakota.

CONDUCT OF ELECTIONS

Colorado, Delaware, Minnesota, New Jersey, and Wisconsin enacted miscellaneous amendments of a detailed or clarifying nature with reference to the administration of general elections. Local election arrangements were altered in various respects in Arkansas, Delaware, Georgia, Iowa, Michigan, Montana, New Mexico, Oregon, Texas, Wisconsin, and Virginia. Nebraska restored election laws to the status existing prior to the enactment of the Soldiers Voting Law. Kansas created a commissioner of elections, appointive by the governor, for all counties having registration, upon whom was conferred various powers of city, county, and township election officials. County auditors in Washington were made supervisors of all general elections. Election commissioners were created for two populous counties in Nebraska. New Hampshire authorized the Attorney General to appoint a challenger at any polling place. Precinct foremen were created in Nevada, who will be required to attend county schools to be instructed in the election law. Separate precinct canvassing boards were set up in California. New York, Pennsylvania, and Wyoming altered provisions affecting election judges and challengers. Increases in the compensation of election officials were provided in nine states. Provisions relating to voting precincts and polling places were changed in Alabama, Connecticut, and Massachusetts. Connecticut, North Carolina, and Tennessee legislated with respect to special elections.

Voting qualifications or residence requirements were amended as to details in Connecticut, New Mexico, New York, South Dakota, and Wisconsin. A dozen states made changes in their ballot laws with respect to printing, custody, form, or marking. Most notable were: new constitutional provision in Colorado for an absolutely secret ballot; establishment in effect of the short ballot by the new Constitution of New Jersey; adoption of the presidential short ballot in Utah; elimination of the party circle in Washington; authorization of the check-mark as an alternate method of marking ballots in Maine and New Jersey; insuring a party of the exclusive use of its name on the ballot in Wisconsin; and the provision for separate referendum ballots in Montana for all questions involving state finance. A new voting machine law authorizing the use of voting machines in all cities and counties was passed in Colorado. Voting machine provisions were amended as to details in eight states. Proportional representation was discontinued in New York City, Long Beach, N. Y., and Boulder, Col. Polling hours or procedures were altered in five states. Provisions relating to vote counting and canvassing, recounts, or election contests were amended in six states.

REGISTRATION AND ABSENT VOTING

Many revisions of the details of registration administration and procedure having to do with periods of registration, closing registration before elections, records, revision of records, change of registration, cancellation, party enrollment, appeals, fraudulent registration, and/or increased compensation of registration officials were enacted in 20 states, few of which were of much importance. Delaware amended her constitution to authorize the General Assembly to enact uniform laws for absentee registration for those in the armed forces and merchant marine and for those absent from the state because of incapacitation resulting from such service. Colorado centralized registration administration in the county clerks and in an election commission for the City and County of Denver and provided for cancellation of a voter's party registration after failure to vote in a general election.

Arizona, Iowa, North Dakota, and Washington repealed their wartime absent voting laws. Ohio re-enacted her absent voters law of 1945 for those serving in the armed forces, which was to have expired Dec. 31, 1947, with a number of changes as to details. New provisions prescribing qualifications and procedure for casting absentee ballots by members of the armed forces were passed in Oklahoma. New York substituted for the State War Ballot Commission a Division for Servicemen's Voting in the office of the Secretary of State. The new agency is to be headed by two directors (bipartisan) appointed by the Secretary of State upon nomination by the majority and minority leaders of the legislature. Arrangements for servicemen's absent registration and voting remain unchanged except for slight alterations in procedure and the moving of convention and primary dates previously noted. New Jersey enacted a temporary military service voting law applicable only to the primary and constitutional convention elections of 1947.

New York extended the absent voting privilege to voting in primaries, to members of the family of a voter necessarily absent, to veterans absent for medical treatment, to Federal employees or members of the armed services, to students, and to school superintendents and teachers employed outside the county of their residence. California, Colorado, Delaware, Maine, Michigan, and Oregon made changes in the details of absent voting procedure; Colorado provided for separate polling places and counts for absentee ballots; and Nevada forbade the sending of campaign literature and all other enclosures with absentee ballots.

CORRUPT PRACTICES

Six states legislated with respect to corrupt practices. New Hampshire increased the fine against registration supervisors for failure to strike out the name of an unqualified voter or to insert the name of a qualified voter, or for registering an unqualified voter from $50 to $300. Fraudulent voting was made subject to a fine of from $50 to $500, and all election offenses for which no specific penalties are assessed by law were made subject to a maximum fine of $100. New Mexico made bribery in connection with voting a felony. The location of registration and polling places where liquor is dispensed was prohibited by New York. Impersonating a registration agent was made a felony in Pennsylvania. Tennessee forbade the removal of a ballot box from the polling place before the completion of the count and the cancellation of all vacant spaces on the poll books and talley sheets, the latter as a precaution against the addition of any names. Washington elaborated prohibition on electioneering near the polls on election day and repealed the section forbidding newspapers to receive consideration for election support.

COUNTY GOVERNMENT

By Mary Capen Davis
Assistant Professor, New Jersey College for Women

OPPOSITE TENDENCIES IN THE ROLE OF COUNTIES

If one endeavors to assess the role of counties in the governmental pattern of the United States, two opposite tendencies appear which have become visible in past years. In certain states the county has emerged as a genuine agency of the locality, performing vital functions and representing a growing community sense. As the "Report of the Wisconsin Joint Interim Committee to Study County Government" (p. 7) expresses it: "Counties had been looked upon as arms of the state government designed to carry out state functions. Today counties are far more than that, they are important units of local government."

On the other hand, in some areas the county has become an obsolete unit which complicates the effective performance of public services. Politics in the bad sense and the development of population and resources in directions unrelated to county lines may account for such a decline. Occupying a middle ground between these extremes one finds another situation in which counties are required to supply an increasing number of services but, because they lack sufficient resources of money and trained personnel, are forced into greater reliance on state and Federal aid and acceptance of the controls which accompany such aid. The problem of county government is the problem of all government. It is the question how to supply needed services efficiently while maintaining a genuine responsibility to the electorate. The answering of this question is complicated for each of the three levels of government in our system by the existence of the other two. It is further complicated by functional divisions within each level. Although much remains to be done to improve our local government machinery, some encouragement can be derived from the fact that an increase in county functions has often been linked with general or specific reorganization.

CONSTITUTIONAL CHANGES

The principal constitutional change in county government for 1947 occurred in New Jersey where a new state constitution was adopted Nov. 4. A considerable liberalization of county powers is granted by the new constitution. Article 4, Section 7, paragraph 10, allows the legislature to pass special, private, or local laws affecting the internal affairs of a county upon petition of the county's governing board, these laws to become operative only upon a vote of the governing body or of the legally qualified voters. Paragraph 11 of the same article and section specifically requires that constitutional provisions and laws concerning counties shall be liberally construed to cover all necessary and implied powers. A general reorganization of the judiciary gives to each county a single court in place of the five county courts previously in existence. Finally, counties are authorized to clear, plan, and develop blighted areas within their boundaries.

CONTINUATION AND DEVELOPMENT OF COUNTY FUNCTIONS

There was the usual quantity of permissive legislation giving counties power to continue existing services. California and Maryland passed laws clarifying the general organization and powers of their counties. The California act covers all aspects of county government and consolidates and revises the existing law on the subject. It presents a picture of a vigorous, responsible government, enjoying considerable powers and performing many important functions, constructively related to the state but neither dependent on it nor hamstrung by it. California counties certainly illustrate the first tendency described at the beginning.

The Maryland law gives to county commissions, not already possessed of such powers, rights to acquire or sell property for public purposes, grant franchises, provide for appointment and removal of county officers, fix salaries, establish merit pension, and retirement systems, and exercise public health functions.

Several states made specific additions to the functions of some or all of their counties. Most of these provide for creation of special districts, departments, or commissions. Illinois authorized county boards to create county weed-control departments. In Utah, the county commissioners were empowered to establish special improvement districts outside the incorporated areas of cities and towns for the development of water and sewer systems. Colorado allowed its counties to set up county health departments and recreation districts. A special California law permits county boards of supervisors to declare the county an air pollution control district and appoint an air pollution control officer. Second class counties in Pennsylvania may create a County Transit and Traffic Commission to investigate transit and traffic conditions, and consider coordination of existing services and safety measures.

The New York legislature passed an act enabling the board of supervisors of counties, not possessing a general health district, to appoint public officers, such as nurses, doctors, sanitary inspectors, etc. These public health employees are to work under the direction of a county public health committee which is likewise appointed by the board of supervisors. New York has also constituted each county in the state, except those including the cities of New York, Oswego, Poughkeepsie, Auburn, and Newburgh, a county public welfare district. The area in each of these excepted counties outside the city is to be a public welfare district also.

Iowa has established county school systems to operate under the direction of the county board of education and has authorized counties to set up county library districts including one or more counties to provide free public library service for rural inhabitants of counties. In Oregon, counties have been authorized to create county planning commissions to prepare a land development pattern, land-use regulations, and subdivision control for unincorporated areas. Ohio has also allowed its counties and townships to adopt zoning ordinances for unincorporate territory and appoint a zoning commission.

FINANCIAL PRACTICES

A few states instituted changes designed to improve the tax assessment or budgetary procedures of counties. In Iowa, the county auditor was made county assessor with power to appoint qualified deputy assessors from a list certified by the state tax commission. Iowa also required establishment of a board of review to review the county assessments. Kansas provided that counties with a county assessor may adopt the provisions of a state law setting up procedures for securing a complete listing and an equitable, uniform, and fair assessment of all real estate and improvements along the lines recommended by the Kansas legislative council in 1940.

A Tennessee law was passed allowing city and county legislative bodies to make contracts with corporations, firms, or individuals in order to achieve more efficient and equitable tax assessments. The state also requires county revenue commissioners to publish an annual account of their receipts and expenditures. New Hampshire has revised county budgetary procedures requiring the county commissioners to give advance notice of their budget to the legislative body of the county which is then to hold a public hearing on it. Provision is also made for review of county expenditures in terms of the budget after its adoption, and appropriations by the legislative body are required to be itemized in detail and recorded.

COUNTY MANAGER

County manager plans have gone into effect in counties in three states. Anne Arundel County, Maryland was authorized to appoint a county business manager to be chosen on a merit basis and to act as chief executive of the county. He will have power of appointment and removal except over the police and the liquor licensing commission, will control all financial functions, and have supervision of roads and public works. The Tennessee legislature passed an act providing for the election of county commissions to have all legislative powers, except establishment of the annual tax rate, and to appoint a county manager. Fulton County, Georgia voted for the manager form of government in June 1946, and the 1947 legislature implemented the county's decision by passage of a county manager bill. The Montgomery County, Maryland charter commission, which was created as a result of popular vote in 1946, has proposed a new county manager charter to be voted on in 1948.

MERIT AND RETIREMENT SYSTEMS

The slow development of measures designed to improve the quality of county personnel continued in 1947. California's new county government act allows counties to adopt a limited civil service system, if accepted by a majority of the qualified electors in the county, and creates a retirement system covering all county officers. Virginia authorized Fairfax County to establish a system of pensions and retirement allowances for all officers and employees, extended the retirement system in Arlington County, and made mandatory a pension system for firemen and policemen in Norfolk County. In New Jersey, counties and municipalities are allowed to put the question of adopting a civil service system on the ballots of general or municipal elections. Illinois has established a system of competitive examinations for employment and promotion in county service. The Colorado State Department of Public Welfare has been authorized to set up a merit system for the employees of county departments of public welfare. Utah has instituted a retirement system for all appointive officers and employees of counties.

CONSOLIDATION AND COOPERATION

City-county consolidation or joint operation of services by cities and counties or several counties offer possible solutions to the problem of dispersal and duplication of functions so visible in local government. One instance of city-county consolidation and several of inter-unit cooperation are to be found in the record for 1947.

In Louisiana, a charter providing for consolidation of the city of Baton Rouge and the parish of East Baton Rouge was accepted by the voters. A Wisconsin act authorized several counties or a city and a county to establish a common department of health, and West Virgina authorized its counties to cooperate with each other or with municipalities to employ health officers or maintain health equipment.

California's revised county government law permits counties to lease equipment, do work, or supply goods for any district or municipal corporation within the county if the district or municipal corporation pays for same. A Kansas law allows two or more counties to employ one social welfare director, while the Indiana legislature authorized joint city-county planning, multi-county flood control districts, and city-county health units.

INTERLEVEL RELATIONS

Financial aid, with or without control over standards of operation, remains the chief item in the category of relations between counties and states or counties and the Federal Government. Here, California proves the rule and provides an exception. It granted state aid to counties establishing and maintaining a tuberculosis ward or hospital conforming to the regulations of and approval by the State Department of Public Health, granted aid to approved county health departments, and established a conference of local health officers to assist the State Department of Public Health in formulating standards of organization and operation of local health departments and qualifications for their personnel. The State Department of Public Health was also authorized to set up field training centers in the local departments.

California likewise created a State Communications Advisory Board, composed of state, city, and county representatives, to coordinate the operation and use of publicly owned and operated communications facilities between local, state, and Federal agencies. Finally, California authorized any county, city, state, or Federal agency to exercise jointly any powers common to the several units. New York provided state aid for counties establishing a public hospital or clinic or for the expenses of any other county public health enterprise.

The formula of aid plus control was used in Massachusetts, which requires county airport commissions having an offer of Federal funds to designate the Massachusetts Aeronautics Commission as its agent to receive the funds and further requires any contracts for airports to be approved by the state commission. Where Massachusetts counties have appropriated 50 per cent of the cost of an airport, the state will reimburse them to an amount not exceeding 25 per cent of the cost. Kansas has authorized its localities to accept Federal aid and make contracts with Federal agencies for the operation of airports, and Utah counties are permitted to enter into contracts with the Federal Government for the construction of flood control projects within the counties.

ASSISTANCE TO VETERANS

Some provisions for service to veterans were made by counties in 1947. Wisconsin created in each county a county Housing Authority to provide for the construction and improvement of veterans' housing projects. All veterans' housing activities in the state are to be coordinated by a Wisconsin Veterans' Housing Authority which will cooperate with the Federal Government and assist the local housing authorities. California counties are authorized to use funds and personnel to carry out the Federal housing program and to make agreements relative to housing with the Federal Government and the state. Local agencies may apply for state aid for 90 per cent of the non-federal cost of their housing programs.

In Iowa, certain counties were authorized to appropriate money to maintain information services for veterans and in Arkansas the county Quorum Courts were permitted to make appropriations for offices for the benefit of or services to veterans. Massachusetts provided for back vacation pay and reinstatement in their former positions for county employees returning from the armed services.

UNSUCCESSFUL EFFORTS AT REFORM

If considerable progress was made in the reorganization of county government during the year, there is still a dark side to the picture. The Massachusetts legislature rejected an act making the civil service law applicable to county employees. An Arizona law to allow creation of county planning and zoning commissions, which has been proposed several times, was again defeated. Connecticut failed to pass an act creating a Commission on County Reform to make a much needed study of county government in the state. Alabama rejected an act creating a County Board of Administration as an alternative system of county government which could be adopted by any county on a vote of the qualified voters.

Wisconsin is still struggling unsuccessfully to reform its county government. The 1947 legislature rejected bills to abolish the fee system for county elective officers, to provide a county finance officer, to require centralized purchasing by a county purchasing agent and to require consolidations of all county welfare activities under one county welfare department. Three joint resolutions dealing with county government were also defeated. One would have amended the Wisconsin constitution to provide optional forms of county government. One would have proposed another constitutional amendment relating to the powers of county boards and the uniformity of county government. The third would have created a joint interim committee to study, revise, and codify all laws relating to county government in the state. Thus legislative as well as constitutional reform of Wisconsin counties has been at least temporarily blocked.

DIVISION V

MUNICIPAL GOVERNMENT

NEW YORK CITY AFFAIRS

By Theodore H. Skinner
Professor, New York University

MAYOR O'DWYER'S SECOND YEAR

Even as the occupant of the White House was finding that a year of ostensible peace was filled with problems clamoring for solution, so the occupant, for his second year, of Gracie Mansion discovered that the life of the Mayor of the world's largest city is not an easy one. At the very beginning of the year, a prison break from the ancient city prison (Raymond Street) in the Borough of Brooklyn served to focus critical attention on City Hall. The closing days of December brought the Mayor back from a short vacation to find the city streets buried under the heaviest snowfall in history. And the intervening months presented one serious problem after another.

The proximity of a Presidential election in 1948 added political overtones to the serious economic and administrative difficulties confronting the municipal authorities. Investigation of city departments, both by the state and by the Mayor's own Commissioner of Investigation, became the order of the day, numerous shifts in administrative personnel were made, and the "five cent fare" at long last ceased to be regarded as a fixture in municipal fiscal policy.

The prison break resulted in the immediate appointment of a new Commissioner of Correction, who proceeded to institute some much needed administrative reforms. Inadequacies in department personnel were revealed, and corrected in part by the use of city policemen assigned to duty with the Department. The episode served to indicate the necessity of a further allocation of funds to correction work, or the assumption of a large portion of its custodial duties by the state.

FINANCIAL PROBLEMS

The need for additional funds for the work of the Department of Correction was but one item in the city's increasingly difficult financial plight. Unlike the Federal Government, with its unlimited taxing power and access to all the resources of the nation, or the state which also has comparative freedom in finding a solution to its fiscal problems, the taxing power of the City of New York is severely circumscribed. When he took office at the beginning of 1946, the Mayor made a careful survey of the city's fiscal situation and discovered a prospective deficit for the ensuing year of approximately $120,000,000. Although this was taken care of by gaining legislative consent to certain additions to the city's taxing power, the rising cost of living forced numerous increases in the salary scale of the city's employees. As a result of this increase and a rise in the operating deficit of the city subway system, the Mayor was faced with a prospective deficit in the next fiscal year of $80,000,000 to $100,000,000.

Accordingly, the Mayor announced that he was requesting the Governor to agree to an increase in the contribution made to the city from the state treasury, $102,000,000 being the amount in question. He also asked for additional funds for low-cost housing, this being one of the major problems of the metropolis. As the state had been able to build up a surplus over the war years of some $600,000,000, much of which had been contributed by residents of the city, the Mayor held that his request was highly reasonable, particularly as the proportion of state revenues being returned to local communities was considerably less than during the administration of Governor Lehman. Governor Dewey, backed by a substantial Republican majority in both houses of the Legislature, was not receptive to the Mayor's request. His refusal was grounded on two points: that the city would receive better than half of all state revenues returned to the local communities ($191,000,000) and that it was destructive of local responsibility for the state to assume a larger share of municipal expense, particularly where the deficit in question was in part due to an antiquated policy as to subway financing.

The political aspects of the controversy extended beyond the state's borders, owing to the position of Governor Dewey as a potential candidate for the Presidency. The Governor would be depicted by his supporters as a defender of sound fiscal policies, while the Democrats would, presumably, point to his utter disregard of the well-being of the largest city in the country. After a bitter two months battle by his representatives in Albany, headed by Comptroller Lazarus Joseph, the Mayor had a conference with the Governor, and announced a compromise. The Governor agreed to press the Legislature for an additional bond issue for public housing, of which $120,000,000 would be allocated to the city, while the Mayor dropped his battle for additional state funds, agreeing that a 27-point increase in the real estate tax levy would enable him to balance his budget. Both the real estate interest in the city and the Mayor's supporters at Albany were dismayed by this sudden decision.

Despite this arrangement, the city's financial position became increasingly precarious as the year drew to a close. In December, after prolonged hearing on the problems of subway financing, the Mayor announced that the ensuing year would see another increase of $161,000,000 over the 1947 budget. He hoped to meet this rise by obtaining $25,000,000 in new taxes already authorized, $51,000,000 by an increase in the subway fare from five to eight cents, and $84,000,000 in increased state aid. In addition, he proposed an increase in the constitutional limit on city borrowing from 10 to 12½ per cent of valuation and on real estate taxes from 2 to 2½ per cent of assessed valuation. As the year came to a close, the successful attainment of the entire program was highly doubtful.

THE ANNUAL BATTLE OF THE BUDGET

Although the various interest groups of the city had been forewarned by the Mayor's discussion of the city's fiscal difficulties and the resultant attempts to obtain additional state aid, the annual budget message to the Board of Estimate and City Council was a shock. A vigorous pruning of departmental estimates and refusal to yield to the demands of various groups for additional social services nevertheless failed to keep the proposed estimates from being the largest in the city's history. The total requested amounted to $1,029,120,314, with the exception of the Federal Government, the first and only $1,000,000,000 budget in American fiscal history. This represented an increase over the record budget of the previous year of $135,000,000.

Of this amount debt service and education each accounted for 19 per cent. Eight per cent was allocated to health and hospitals, police and fire protection accounted for 12 per cent, and 4 per cent went to sanitation. Funds allocated to debt service showed an increase of $15,500,000, while education was allotted an additional $23,500,000. Much of the increase was due to cost of living wage adjustments for transit workers and other city employees, which had been long overdue, together with salary raises for teachers and nurses, the resumption of the three-platoon system in the fire department, and the expansion of the police department personnel to its full quota. Because of his failure to obtain any further contributions from the state, the Mayor estimated that the real estate tax levy would amount to $2.95, a jump of 25 points over that of the previous year.

As was to be expected a wave of tremendous protest ensued. As had been the case in past years, the budget was satisfactory to no one. Employee representatives declared that, while the increases were welcome, the continuing rise in living costs made them still inadequate. Councilman Quill and other spokesmen for the transit workers indicated that a new demand for a wage increase would eventuate shortly. Those interested in education demanded more new schools and an increase in the teaching personnel. In the forefront of the opposition, as in previous years, was the Citizens' Budget Commission, supported by the New York Real Estate Board and the Commerce and Industry Association. The prospect of a possible $5 tax on trucks and $10 on private cars brought the Automobile Association of America into the battle.

Opposition to the continuation of the five-cent fare on the subways, spearheaded by the Citizens' Transit Commission, intensified by another rise in the system's operating deficit, reached new heights and gained new converts from other organizations. As in years past, the Mayor and his associates remained firm in their support of the traditional fare, although the Mayor indicated that he would be willing to submit the matter to a popular referendum at a special election to be held some time in the future. However, the Mayor suggested that the Citizens' Budget Commission undertake a survey to determine whether savings might be made by merging the Police, Fire, and Correction Departments, and the Housing and Building Department with that of Public Works. He also offered the Commission full access to all phases of the city administration for purposes of surveying operations and ascertaining methods of reducing the cost of essential functions. This the Commission agreed to undertake, but the results, if any, could not be reflected in the finances of the current year.

In the two preceding years the Board of Estimate had departed from its time honored custom of merely rubber-stamping the executive budget. In 1945, Comptroller McGoldrick broke with the Mayor in yielding to public pressure. In 1946, the Mayor himself instigated sizable changes. In 1947, while providing spokesman for the various protestants with ample opportunity to present their case, the Board of Estimate made only minor changes in the budget, the total amounting to $2,000,000. In all three years, it may be noted, the changes resulted in an increase in the Mayor's original figures. The required hearings before the City Council brought out no new facts or figures, and that body gave its approval to the final sum set by the Board of Estimate.

During the course of the hearings on the budget, the Mayor announced that, because of errors in the figures submitted to him, the original estimate of the coming tax rate on real estate was too high, and the tax rate as finally enacted by the City Council proved this to be correct. The basic levy for the 1947-48 fiscal year is $2.89 on each $100 of value. Local improvement assessments in the various boroughs brought the rate to the following figure:

Queens	3.06	Increase	0.20
Brooklyn	3.01	"	0.19
Manhattan	3.01	"	0.15
Bronx	2.98	"	0.19
Richmond	2.98	"	0.19

THE TRANSIT PROBLEM

As in the case of his predecessor, Mayor O'Dwyer has been plagued by problems arising from the operations of the city-owned subway system. On the one hand are the financial questions arising from the fact that the operating revenues of the system are not sufficient to make it self supporting, the resulting deficits having to be met from the city's tax revenues. On the other hand are the increasing complexities of management-employee relations, aggravated by the demand of the Transit Workers' Union, headed by City Councilman Quill, to be accepted as the sole representative of the workers and to engage in collective bargaining with the operating agency of the city, the Board of Transportation. Periodically for the past several years, the Union has coupled demands for wage increases and recognition for bargaining purposes with threats to tie up the lines by a strike.

The position of the Mayor in this case was a difficult one. As chief executive of the city, he is directly concerned with any drastic disruption of the normal life of the community which would be involved in any cessation of subway service. However, he has no direct control over such matters, the Board of Transportation being a semi-autonomous body, its three members being appointed by the Mayor for staggered terms, but not subject to removal at his pleasure. General Gross, the president of the Board, was appointed by Mayor La Guardia in 1945. As is the case with many army officers, he is averse to adopting the collective bargaining techniques employed by labor and management in private industry. In this attitude, he was joined by his colleagues, his attitude being solidified by LaGuardia's repeated insistence that city employees had no right to strike against the government. Further complicating matters was the fact that the T.W.U. is not the only organization among the transit workers, and the other unions bitterly resent its demand to be accorded a position as sole representative of all the workers.

Since the beginning of his term, Mayor O'Dwyer has endeavored to arrive at some solution to this problem. The term of one member of the Board expiring early in 1947, the Mayor filled the vacancy by appointing William H. Davis, the well known labor expert and former Chairman of the War Labor Board, to the post. After a thorough canvass of the problem, the new member proposed, with the benediction of the Mayor, that the Board agree to deal with all employee organizations on the basis of their numerical strength, as determined by elections. This proposal was rejected by the remainder of the Board, and when the Mayor sought to intervene, General Gross tartly advised him to stop handicapping the agency in its efforts to operate the lines safely and efficiently. The Mayor then disclaimed all future responsibility for the operation of the system, but stated he would hold the Board strictly accountable for "any results which adversely affect the safety and welfare of the people of the city."

Shortly thereafter, hostilities broke out anew between the Board and the T.W.U. In order to save some million dollars, week-end runs were cut. The T.W.U. claimed that the new schedule put some of the workers on split shifts, part in the morning, then time off, and the rest in the evening. When this protest had no result, the union demanded the dismissal of General Gross and embarked upon a meticulous obedience to all operating regulations, which resulted in a slowdown, with Quill announcing that this might become a "stoppage," with the workers refusing to operate trains under "unsafe" conditions. Bitterness increased when disciplinary action was taken against four workers who were also prominent in the union, but operations were shortly restored to normal.

At this point, the Mayor again stepped into the picture. Reversing the stand he had taken some four months previous, he announced that he was considering an increase in the five-cent fare, subject to the voter's approval in November, and appointed a three-man committee, consisting of his assistant, William Reid, Budget Director Patterson, and License Commissioner Fielding, with instructions to consider what fare would be necessary to meet operating expenses, including potential wage increases. After a thorough canvass of the situation, the committee reported that an eight-cent fare would be required.

Because of the large number of voters who use the subways daily, it is extremely dubious if a fare increase would be approved in a referendum. To increase it without such vote could be dangerous politically. To meet this difficulty, by coupling the increase with provision for other demanded services not at present available, the Mayor worked out a combination program which he announced he would present as a "package" to the Legislature at the beginning of its session. As indicated above this would include: (1) Exemption from the constitutional debt limit of the funds necessary to construct a Second Avenue subway and unify the trackage of the entire system; (2) an increase in the permissible real estate tax levy from 2 to 2½ per cent and a similar increase in the debt limit, which would permit expenditures for the improvement of other municipal services; and (3) authorization to the Board of Transportation to increase the subway fare without referendum to meet operating deficits.

THE QUILL OUSTER MATTER

One governmental matter growing out of the subway dilemma was settled during the year. Both in 1946 and in 1947 the belligerent attitude of Councilman Quill as head of the T.W.U. and his threats to call a "strike against the government" provoked considerable censure. Demands were made that he be ousted from the Council, but that body took no such action. Late in 1946, a taxpayer's suit was instigated to declare his seat vacant on the ground that he had violated the City Charter provision forbidding any member of the Council from receiving remuneration for services with any concern doing business with the city. It was claimed that this provision, designed to eliminate patronage in city contracts, would also apply to a representative of a union of city employees. This question was resolved in 1947, the court dismissing the suit.

LABOR RELATIONS IN PRIVATE INDUSTRY

In a large metropolitan community with its manifold activities and thousands of business concerns, disputes between management and labor frequently occur. With regard to most of these, the city administration has no concern, but some industries are of such vital importance that a disruption of normal business activity can not be permitted to continue long because of the effect on the city's entire business structure, or the health and convenience of its citizens. The year 1947 was not as prolific in serious strikes as was 1946, but the Mayor's intervention was required on a number of occasions. To take a typical month, September found serious disruption in four areas of the city's business, air lines, food stores, restaurants, railway express. The bulk of the city's $2,000,000,000-garment industry ships its product by railway express. Consequently a strike by 4,000 drivers, members of the A.F.L. Teamsters' Union, with picket lines which private truck-drivers refused to cross, produced a serious crisis. The demand here was for a 40-hour week and 15-cent wage increase, with the company agreeing only to the latter.

During the same month, a threatened walkout by the employees of the Safeway grocery chain caused the management to close its stores to avoid possible spoilage of perishable food; the Childs chain of restaurants, serving 50,000 patrons per day, was struck; and a walk-out of airline pilots grounded all American Overseas Airlines planes for a week. In all cases, the city intervened and was able to bring about a settlement and the resumption of normal business.

In the latter part of 1946 was organized, in the executive office, a special Labor Relations Division under the direction of an experienced mediator, Edward C. McGuire. The main function of the agency was to apprehend the possibility of labor-management disputes before they might reach the crisis or strike stage, and by furthering negotiations between the disputants scotch the strike before its inception. The Division continued to function effectively throughout 1947, intervening successfully in some 60 disputes. Its first and only failure occurred when the grooms and exercise boys at the Jamaica race track struck, thus endangering the city's revenues from the tax on pari-mutuel betting within the city's limits.

Although private contractors were involved, two strikes directly concerned the city. Construction at the new Idlewild airport were held up for many months by a jurisdictional dispute, preventing the installation of the necessary electrical equipment in the control tower. The Mayor was able to work out a compromise settlement whereby the two unions agreed to share the work. Similarly a strike of the "sandhogs" employed in pushing through the new vehicular tunnel under the East River to Brooklyn threatened to tie up that project. Here again the Mayor was able to negotiate a settlement personally.

POLICE AND FIRE DEPARTMENTS

The transfer of many members of the Fire Department during the war entailed additional duties for those remaining, as the three-platoon system had to be abandoned during the emergency. The year 1947 found the system once more in working operation and the Department functioning with the desired efficiency.

Police Commissioner Wallender, an appointee of the preceding administration, continued to head the department and, at the close of the year, was able to announce that his once depleted ranks were again filled to the quota prescribed by law. However, the needs of the post-war era are so great that the authorized force can not effectively police the city and cope with traffic congestion. Accordingly, the Commissioner asked for authorization of 2,000 men additional.

In August, a bookmaker complained to Bronx District Attorney Foley that the police had demanded protection money from him. Grand jury inquiries immediately ensued in both the Bronx and Queens. No indictments of any police officers were handed up, but instead it was urged that the state should move to legalize gambling as the only way to meet the problem. Commissioner Wallender announced that every member of the force, from rookie to the Deputy Commissioner, would be held personally responsible for stamping out the "bookies," shifted a large number of officers, and demoted four inspectors to the rank of captain. As on previous occasions, the drive resulted in but few arrests, and none of important operators. In addition to the shakeup mentioned, the Commissioner continued his previous policy of forcing out the older men in the department who were no longer physically fitted for their duties, and replacing them with younger men.

AIR TRANSPORT

In 1946, the financial plight of the city presented serious obstacles to the rehabilitation of LaGuardia Field, and to the completion of the new municipal airport at Idlewild, on the south shore of Long Island. At the instigation of Commissioner Moses, an independent Airport Authority was set up, designed to operate the airports on a self-liquidating basis, thus placing all bonded indebtedness outside the city's debt limit. The new agency continued to be plagued with difficulties, whereupon the Mayor asked the New York Port Authority to submit plans for the future management and financing of the city's air facilities for comparison with those of the Airport Authority. Of the two proposals, the Mayor found that of the well established Port Authority the more acceptable. Accordingly, the airfields in question were turned over to the Port

Authority on a long-term lease, due provision being made for payments to the city in the way of rental, and recapture at the expiration of the lease. The Authority immediately began the rebuilding of LaGuardia Field, as well as the continuation of operations at Idlewild, but it will be some time before the air transport needs of the area can be properly met.

CITY PLANNING AND ALLIED PROBLEMS

As the amendment to the zoning laws of 1946 had been set aside by a decision of the Court of Appeals, the major activity of the City Planning Commission at the start of 1947 was the formulation of a substitute. Unfortunately the Commission was handicapped by a lack of clarity in the court decision and consequently felt unable to make the provisions sufficiently drastic to meet the dangers of a speculative post-war building boom in the retail areas. As in preceding years, it failed again to undertake the constructive work involved in the formulation of a master plan for the city. During the year, the Chairman, E. A. Salmon, was subject to considerable criticism for engaging in private practice while still serving as a member of the Commission. Toward the end of the year, he resigned, and the Mayor appointed as his successor Housing and Buildings Commissioner Robert Wagner, Jr.

Each month during the year, the city's traffic congestion in midtown Manhattan increased. Despite drastic limitations on parking, applying to all streets from Fourteenth to Fifty-ninth, all avenues from Lexington to Ninth, and the area south of Fulton Street, traffic continued at a snail's pace. As usual, numerous suggestions looking to improvement were made, but they proved to be impractical or outside the city's fiscal potentialities. The ban on midtown parking resulted in sharp increases in parking charges by lots and garages. To meet this, the City Council required that all parking spaces must be licensed with no increase in fees permitted save after 30 days' notice to the Commissioner of Licenses.

HOUSING SHORTAGE

As in 1946, the housing shortage remained acute. Three public housing projects for the low-income groups were completely or nearly ready for occupancy at the close of the year, while a number of private projects, such as the Metropolitan Life Insurance Company's projects on the lower East Side, offered some relief to those of more adequate means. But those in the lower middle class, with incomes just above the subsidized public housing bracket, were being compelled to double up with friends or relatives. A number of civic groups urged that the city take advantage of state law authorizing municipal construction of non-profit, non-subsidized housing, but the Mayor's Coordinator of Public Works Construction, Parks Commissioner Robert Moses, was opposed to any type of "socialized" housing, as being a menace to private enterprise, and his view prevailed. In the preceding year, the city attempted to provide for the rehabilitation of the many sub-standard, boarded-up buildings scattered throughout the city, offering tax exemption on improvements necessary to make them habitable, but comparatively few real estate owners have taken advantage of such provisions.

DOCK AND AIRFIELD INVESTIGATION

Memories of the Seabury investigation were aroused by events during the middle of the year. Rumors of irregularities in some departments prompted the Mayor to order inquiries by his own Commissioner of Investigation, John W. Murtagh. The first inquiry centered on the Department of Marine and Aviation, in charge of all docks and airfields. It was brought out that a number of piers had been rented at nominal sums to non-shipping concerns which in turn made large profits from rentals to ship owners who could find no other space available. Deputy

Commissioner Brody was removed from office, and later indicted by a grand jury. Former Commissioner of Commerce Sanders was charged with wrongfully obtaining pier space for a concern in which he had an interest. A third investigation by Murtagh charged the city airport director with improper dealings with one of the oil companies doing business at the airports under his direction. He was brought up on charges and removed from office.

INVESTIGATION OF WELFARE ADMINISTRATION

The most extensive inquiry was that dealing with the operations of the Department of Welfare. This resulted from wide publicity given in the press to criticism of two phases of welfare expenditure. It was charged that indigent families were housed in hotels at the prevailing high rates and that city employees were receiving relief payments. Commissioner Murtagh gave the Welfare Department a clean bill of health as to these matters. At this point, the State Welfare Department entered the picture and launched its own inquiry, announcing it would inquire into all phases of welfare administration, and particularly into those dealing with the alleged special privileges of those employees who were Communists or "fellow travelers." At this point the Mayor requested the resignation of Commissioner Rhatigan, replacing him with License Commissioner Fielding. The latter announced that he had discovered a number of instances of inefficient administration which he had remedied. He offered full cooperation to the state department's investigation, which was still in progress at the close of the year.

POLITICAL AFFAIRS

The year 1947 was an "off year" so far as elections in the city were concerned, but two items of considerable importance occurred. Upon assuming the mayor's office, General O'Dwyer served notice that the administrative chief of the city would be a political leader as well. Noting the increasing criticism of the operation and control of the New York County Democratic organization, he directed his attention toward a change in the leadership, throwing his support to Frank J. Sampson in opposition to Edward V. Loughlin, and his chief supporters, Clarence Neal and Bert Stand. Enlisting the support of national party leaders and with the judicious use of his patronage power, he was eventually successful, and in March Leader Loughlin resigned in favor of Sampson.

DEFEAT OF PROPORTIONAL REPRESENTATION

Since the adoption of the new Charter, the City of New York has elected the members of the City Council by proportional representation. On two previous occasions, the Democratic organization attempted to persuade the voters to discard the system and return to the old single-member geographical district arrangement. In 1947, a third attempt was made, and this time it was successful. As the majority party, the Democratic organization would expect to benefit, as the old system was designed to provide minority representation. The new system—with Councilmen elected from state senatorial districts—may very probably, as in the past, provide a Council with only one non-Democratic member. The defeat of proportional representation was due to three factors in the main: (1) the absence of the independent or marginal voter, who appears only when major contests for public office are involved; (2) the vigorous support of the Republicans, whose victories in the local Congressional elections of 1946 gave them confidence that they were numerically on even terms with the Democrats in many districts; and (3) increasing public hostility to Communists and "fellow travelers." The municipal election of 1945 resulted in the presence of two Communists in the Council, and this was emphasized by campaigners and the majority of the press as a menace to the "American Way," P. R. being described as a Communist importation, the first stage in the subversion of the Constitution. The supporters of P. R. did not wage as vigorous a battle in its defense as had been expected. They hope, however, to raise the issue again and eliminate the single-member system before the next councilmanic convention.

MUNICIPAL POLITICAL TRENDS

By Alfred Willoughby

Executive Secretary, National Municipal League

CONTINUED REVIVAL OF CIVIC REFORM

A civic revival of unprecedented proportions, centering chiefly in communities which had been rising ever since the end of the Second World War, continued unabated during 1947. Its full political impact may still be uncertain, but it was marked by the sudden retirement, voluntary or involuntary, of a number of figures long familiar in local circles and, most notably, by a more mature and intelligent approach by citizens generally to municipal problems. Impatience with the old political ways of handling local services was general.

As *Life* magazine commented editorially (Oct. 6): "Some of this is due to veterans who came back with reinvigorated ideas of democracy; in Athens, Tennessee, they turned the rascals out at gun point. Some is due to the pressure for higher wages by city workers and teachers; with so many exacting eyes on them, city fathers find it harder to clip away a dishonest dollar. But the most significant thing about the present reform wave is that it has intelligent direction. Americans now appear to have sufficient political maturity to know what they want and how to get it."

TREND TO MANAGER PLAN

For the second successive year, adoptions of the council-manager form of government broke all previous records. The manager plan was adopted by 88 municipalities in the United States, and two more were added by Canada. This broke the record of 81 adoptions in 1946, the previous record being 48 in 1921, with an average of under 30 during the intervening years.

MUNICIPALITIES ADOPTING THE MANAGER PLAN IN 1947

Alabama—Bessemer.

California — Avalon, Woodland, Hayward, Petaluma, Auburn, Menlo Park.

Colorado — La Junta, Trinidad, Canon City, Golden.

Connecticut — Windsor, Farmington, Manchester, Milford.

Florida — Pompano, Dade City, Madison.

Georgia—Fulton County (Atlanta), Augusta, Dalton.

Illinois—Brookfield.

Iowa—Chariton.

Kansas—Colby, Russell.

Maine — Madison, Monmouth, Monson, Boothbay, Pittsfield, Bath, Calais, Bar Harbor.

Massachusetts — Saugus, Revere, Worcester, Medford, Quincy.

Michigan—Wayne, Sylvan Lake, Allegan.

Minnesota—Montevideo, Hopkins.

Missouri—University City, Charleston, Otterville, Hannibal, De Soto.

Nebraska—Lexington.

Nevada—Reno.

New Hampshire—Dover, Claremont, Keene, Portsmouth, Franklin.

North Carolina — Raleigh, New Bern, Whiteville, Kinston, Elizabeth City.

Oklahoma — Stigler, Anadarko, Lindsay, Pauls Valley.

Oregon—Coquille, Cottage Grove, Tillamook.

Pennsylvania—Oakmont.

Tennessee—McMinn County (Athens).

Texas—Midland, Sulphur Springs, Bonham, Carthage, Brownwood, Harlingen.

Utah—Vernal.

Vermont — Brandon, Montpelier, Bethel.

Virginia—Colonial Beach, South Norfolk, Pearisburg, Richmond.

Washington—Sunnyside.

West Virginia—Grafton, Oak Hill.

Wisconsin—Ashland, River Hills.

Canada — Rimouski and Rouyn, Quebec.

RICHMOND, VIRGINIA

With the overwhelming adoption of the council-manager plan in November, the capital city of the Old Dominion completed progress in a two-year "revolution" against the reigning political system which normally has taken other cities two generations to accomplish.

Richmond has had a distinctly old-style kind of government, with a two-house legislative body, numerous independent boards and commissions, and general diffusion and confusion. As in most communities, popular indifference was the chief bar to progress. For many years, no more than 3 per cent of the voters had bothered with municipal elections.

The awakening came under the leadership of the city's newspapers and nonpartisan civic organizations. In 1946, the people voted overwhelmingly to have a commission write a modern charter. The commission, composed of distinguished citizens, offered the council-manager plan. After a brilliantly led educational campaign, sponsored by the Richmond Citizens Association, the voters turned out in record numbers and approved the new charter by a vote of three to one. The only opposition came from incumbent politicians.

CHICAGO

Something new and distinctly unfamiliar happened to the nation's second largest city. Obviously out of patience with the long record of racketeering and the tender attitude of the political powers toward crime, the voters elected Martin H. Kennelly, self-made business success and long-time reformer, to succeed Edward J. Kelly as mayor, by a huge majority.

Kennelly, as head of the citizen-sponsored Chicago Crime Commission, had been a severe critic of the Kelly machine and had accepted the Democratic nomination for the mayoralty only with the public understanding that the organization would not stand in the way of bringing good government to Chicago.

In less than a year in office, Mayor Kennelly has taken politics out of the public schools. He has paid the city's bills and put it on a cash basis by establishing a $12,000,000 revolving fund. City purchasing is on a business, money-saving basis. A high-grade civil service commission was appointed, and progress is being made toward eliminating the spoils system. Streets and alleys are cleaner. Organized crime is having a tough time. Experts were employed and traffic accidents reduced. A start has been made on slum clearance and new housing. Unnecessary employees have been dropped.

So refreshing was this kind of performance for Chicago that the state Democratic organization asked Mayor Kennelly, at the end of the year, to be its candidate for governor of Illinois. Kennelly declined. He had promised that Chicago was going to have good government, and he was sticking to the job.

BOSTON

The phenomenon that is James Michael Curley kept the country in a state of amazement over the strange condition of politics in Boston, but, as usual, a great many Bostonians took the situation as a matter of course.

Sentenced to prison for mail fraud, Mayor Curley shouted at the Federal judge, "You are sentencing me to death," and he received the last rites of his church.

But while he served his time in the Federal House of Correction at Danbury, Connecticut, his health improved, and he declared he felt "ten years younger" when his six-to-eighteen-month sentence was commuted by President Truman after five months and he returned to the mayor's chair which had been kept warm for him by City Clerk John B. Hynes as acting mayor. Both received the customary $20,000 a year salary simultaneously. The Republican-controlled state government explained that it was wary of making a martyr of Democrat Curley.

During Curley's absence, a strong movement developed to permit the people of Boston to vote on the adoption of Plan E (council-manager plan with proportional representation) which has been spectacularly successful in neighboring Cambridge, but the legislature declined to permit submission of the question.

When Curley returned to the Boston city hall the morning after Thanksgiving, he was welcomed by a throng of 1,500 people shouting their joy at having "our Jim" back.

The Plan E for Boston Committee grimly put its leadership in the hands of young men and announced its determination to arouse the city with a real rebellion against the *status quo*. The chairman is Frank Ahearn, a 30-year-old attorney, Navy veteran, and Boston College honor graduate. Meanwhile, five more Massachusetts cities—Saugus, Medford, Quincy, Revere, and Worcester—adopted Plan E in 1947, thus heightening the pressure for good government in Boston. But the same senate which sat on Plan E for Boston in 1947 would sit in the senate chamber in 1948.

PHILADELPHIA

The Republican machine which had held on to Philadelphia since 1884 had its worst scare during the 1947 municipal election campaign when a political novice, Richardson Dilworth, Democratic candidate, aroused the apathetic city of brotherly love in a spectacular campaign.

Dilworth, 49-year-old socialite lawyer who fought with the Marines in both World Wars, conducted a slugging campaign during which he hired investigators to rake over the mud, which was plentiful, rounded up a corps of pretty girls to wear "Dilworth for Mayor" ribbons across their bosoms, spoke four or five times a night from the tops of sound trucks on street corners, and covered each of the city's 52 wards, most of them twice.

Despite the serious charges of graft and improper conduct in office, the old machine came through as usual, however, and the feeling of contentment settled back over the people.

DENVER

Aging Benjamin Stapleton, who reigned as Denver's mayor for two decades, was overwhelmed in the spring election by Quigg Newton, 35-year-old Navy veteran and lawyer, who pledged to rid the city hall of machine rule.

At the same time the people voted to call a convention to revise the city charter, which had been the basis of the 72-year-old Mayor's power. The charter convention's work, which constituted merely refinements of the old charter rather than a new approach, was rejected by the voters later in the year.

JERSEY CITY

One of the most startling political developments of the year was the sudden retirement of Frank Hague as mayor of Jersey City. But the retirement was more apparent than real, for he retained his post as Democratic leader of Hudson County and, without benefit of election, "crowned" his nephew, Frank Hague Eggers, to rule as mayor in his place.

It was generally believed, when he announced his retirement in June, that he had become fearful, after 30 years of dictatorship, during which he had brooked no opposition and had ruthlessly crushed any signs of it, that growing opposition might suddenly crush him as it had his ally in neighboring Hoboken, Mayor Bernard Mc-

Feely. The state had forced the use of voting machines on his domain. A modern state constitution was in preparation. Three successive governors whom he could not manage had been elected.

But close observers of New Jersey's political scene found it difficult to believe that, even at 71, Frank Hague would relinquish his power. Before the drafting of the new constitution was completed, his enemies compromised with him and softened provisions to which he objected rather than risk his opposition.

And before the year ended there were well substantiated reports that Hague had succeeded in taking under his wing the new "reform" administration which had unseated the McFeelys in Hoboken.

HOBOKEN, N. J.

Across the Hudson River from New York, Hoboken, a dreary one square mile of wharves, factories, warehouses, 300 bars and liquor stores, bleak tenements, and 50,000 people, had endured the dictatorial rule of Bernard "Barnacle" McFeely for more than 20 years. Virtually all his relatives were on the payroll. Edward, a brother, was police chief; Dennis, nephew, deputy chief; Tom, nephew, superintendent of schools, and so on through a long list representing a degree of nepotism unequaled in modern times.

McFeely, who also owned the company which collected the city's garbage on contract, never denied published reports that he had amassed a fortune of $3,000,000 although his salary had never exceeded $5,000.

A revolt begun by young policemen who claimed they were persecuted by the McFeely machine, joined by the League of Women Voters and other groups, overwhelmed the McFeely machine in the spring election. The "reform" commissioners retained the Consultant Service of the National Municipal League to make an administrative and financial survey which promptly disclosed that the city had at least 244 superfluous employees, a large share of them unqualified for the jobs they held. The report said Hoboken had paid enough in taxes to buy a high quality of service but that this money had been dissipated by the typical boss method of hiring many favored, unfit individuals.

YONKERS, N. Y.

James A. Sullivan, vice mayor of Yonkers, who had gained nation-wide notoriety during the war by sending, over his own name, to mothers of men killed in action a letter which was a copy of the classic one to Mrs. Bixby by Lincoln during the Civil War, was indicted on a charge that he had set up a bogus business to cover large scale bookmaking operations in the city-owned Labor Temple.

Sullivan, who had been a steadfast foe of the council-manager plan and the proportional representation method of voting which had brought considerable progress to Yonkers, resigned in the midst of an investigation which had revealed that he and his wife had banked huge sums of money while the bookmaking operation was in progress.

Meanwhile, Yonkers elected a majority of a fusion slate to the council and continued to improve its government.

SAN ANTONIO, TEXAS

Maury Maverick, former San Antonio mayor and onetime congressman, was defeated in an attempt to recapture the mayoralty after his five years in Washington as head of the Smaller War Plants Corporation and other agencies. During his two years as mayor, Maverick had been credited with eliminating politics from the health and other departments, reducing traffic deaths and crime by 50 per cent, promoting a spectacular slum clearance and civic beautification project, and generally giving the city the most enlightened administration it had had in many years.

ATHENS, TENN.

The shooting, by which war veterans had protected the ballot boxes of McMinn County in 1946, subsided into solid, unspectacular progress under the leadership of the McMinn County Good Government League. Audits of the county records revealed what everyone knew—corruption and inefficiency—and the League proceeded to put the governmental house in order by gaining the adoption of a county manager form of government.

MUNICIPAL FUNCTIONS

By H. G. Pope

Executive Director, Public Administration Service

GENERAL

The ledger of progress in municipal administration as recorded in greater detail in officials' responses to the *Municipal Yearbook's* inquiries and in its series of articles interpreting municipal trends, shows, for the year 1947, both debits and credits. A single year, of course, is not a sufficient period of time for judging the accomplishments or for measuring the improvement trends, either for a single city or for all cities. On the other hand, a single year should be a sufficient span of time to witness the fruition of a number of progressive developments begun earlier and the starting of many new projects. A digest such as this must necessarily limit itself to citing only a limited number of the numerous reported incidents which together constitute the year's reported municipal administrative changes.

DEVELOPMENTS ON THE CREDIT SIDE

The year 1947 was marked by a number of developments on the credit side, among which are:

1. Annexations, consolidations, and establishment of cooperative arrangements in order to adjust the political area to the natural economic and social area and thereby to overcome the strangulation effects of obsolete political boundaries.

2. Further recognition that the physical deterioration in the centers of our cities and the haphazard and uneconomic fringe growths are not uncontrollable phenomena—a recognition apparent in the establishment of planning agencies in a number of municipalities, and the assignment of an enlarged responsibility to the municipal government, in a number of larger cities, for providing modern transportation in an attempt to overcome the stultifying effects on municipal growth of the almost universally inadequate transportation systems.

3. Adjustment of municipal government machinery to forms which are ultimately more responsive, accountable, and efficient—an adjustment evidenced by the large number of cities which adopted the council-manager form of government during the year and the improvement of administrative processes through the adoption, by a number of cities, of sound systems of financial and personnel administration, the reorganization and consolidation of functions, and through the improvement of services.

DEVELOPMENTS ON THE DEBIT SIDE

Against these and other accomplishments, it may be worthwhile to cite a few of the items appearing on the debit side, representing for the most part significant areas of comparative inaction. In general, only limited progress was made in the furtherance of home-rule for cities. The lack of home-rule was most manifest in the inability of cities to solve their critical financial problems. In some states cities made moderate headway in persuading the public and the rurally dominated state legislatures of the need for more autonomy in meeting their fiscal requirements, but many cities had to resort to makeshift remedies and the curtailment of desirable public services. Few cities fully exploited their opportunity to contribute realistically and aggressively to the solution of critical urban housing problems, both as they relate to the present and to the immediate future. In a number of cities, as new functions were added or old functions were reviewed, boards, commissions, or other administrative organizations were established which were given partial or complete independence of the regular municipal government. The creation of such agencies usually contributes to the complexity and difficulty of municipal administration, and offsets in part the progress made otherwise in decreasing the excessive number (155,000) of governmental jurisdictions. Also, the lack of aggressive experimentation in municipal administrative organization might be mentioned. For example, no new city reported joining the few places which carry on completely integrated school-recreation-library programs or those with integrated police and fire services organization.

POLITICAL ANNEXATIONS AND CONSOLIDATIONS

Annexation remained one of the most popular and direct ways of correcting outdated political boundaries which strangle many municipalities. It is generally conceded that annexation permits a political body to keep up with economic and social forces which spring up beyond its reach, enables a more orderly development of the community, and provides a better and more stable community-wide tax basis and service structure. However, annexations are usually controversial, with residents of the area to be annexed concerned over the prospect of increased taxes and loss of independence and identity in being merged with a large jurisdiction. Similarly, citizens of the annexing jurisdiction may be concerned over the fact that the expense of supplying full municipal services to annexed areas may exceed the revenue provided by the enlargement of the tax base. Even where parties to annexation are agreed on its desirability, in many states legal complications and obstacles make it difficult for municipalities to expand their boundaries. Recent state legislation in Colorado simplifying annexation procedures made it possible for Boulder to annex areas lying within the outer limits of the city. A proposed constitutional amendment in Washington would permit consolidation in the Seattle area. More or less conventional annexations were exemplified in such cities as Louisville, Kentucky, which increased its area by 60 per cent with the annexation of 24.8 square miles of territory; Milwaukee, Wis.; Grand Junction, Col.; Albany and Atlanta, Ga.; and Terre Haute, Ind. The annexation of certain township areas surrounding Toledo, O., will be decided by an election to be held in 1948.

There were several examples of consolidation of local governments. The cities of Goose Creek, Baytown, and Pelly, Tex., were merged with provision for reorganization and renaming. Baton Rouge, La., and East Baton Rouge Parish were consolidated under a strong-mayor form of government. The borough of Southington and city of Stamford, Conn., were consolidated with their respective towns (townships). Daviess and Livingston counties, Missouri, voted to eliminate their township government.

MUNICIPAL AND COUNTY COOPERATION

Much more numerous than annexations and consolidations were a variety of instances of cooperation and joint action by municipalities and counties for the solution of common problems. Several motives contribute to such action. Enforcement of regulatory measures and some types of municipal services may be augmented by administration by a regional authority which has power to act over larger areas. Another reason is that increased volume of activities frequently permits the use of technical personnel and more efficient equipment and methods. Examples of joint action include the establishment of city-county health departments in Seattle and Bellingham, Wash.; Omaha, Neb.; and Lansing, Mich. A joint approach to sewage disposal problems has been authorized for the city of Cincinnati and Hamilton County, Ohio, and for the city of Louisville and Jefferson County, Kentucky. A garbage disposal system which would include Pittsburgh, Pa., was proposed for Allegheny County. The cities of River Rouge, Ecorse, Wyandotte, and Lincoln Park, Mich., cooperated with the villages of Allen Park and Trenton, and Ecorse Township to develop a garbage disposal system. Muncie and Anderson, Ind. signed a contract for operation of a joint airport. Air pollution control measures were the subject of intergovernmental cooperation in an increasing scale and of city-county action in Pittsburgh, Los Angeles, and Milwaukee.

An interesting approach to overcoming certain limitations of local units is revealed in the legislation of two states. Cities in Nevada are now authorized to enter into cooperative arrangements with counties for joint employment of clerical personnel in certain offices while apparently retaining the legal separation of functions of those offices. In Missouri, cities are authorized to cooperate with other governmental organizations for the establishment of joint authorities in the field of public improvements of common services. The operation and development of seaport and airport facilities in Newark, New Jersey, and the airfields in New York City of Idlewild and La Guardia were turned over to the Port of New York Authority, an agency created 26 years ago by New York and New Jersey for the development of terminal facilities. A proposal is under consideration to develop and operate the waterfront facilities, a huge market, and a center for industrial exhibits in New York City by the World Trade Corporation, an authority created recently by the state legislature.

Planning continued to furnish a popular basis for drawing together Units of local government for the purpose of developing regional programs and securing cooperative action. The regional planning commission of Cuyahoga County, Ohio, in which Cleveland participates, will provide planning services for the smaller communities to expedite the development of plans for expressways and other interurban public works. In Atlanta, Ga., an intercounty planning commission of Fulton and DeKalb counties will prepare a master plan for the region to supplement work of the city planning commission. Reorganization of the planning authority in the Detroit area brings together Wayne, Oakland, Macomb, and a part of Washtenaw counties. The planning agency in the Philadelphia-Camden area brought together 42 local governments to prepare a plan of public works improvements covering eight counties in Pennsylvania and New Jersey. Coordination of city planning between Omaha, Neb. and Council Bluffs, Ia., is an example of cooperation across state boundaries.

PUBLIC UTILITIES AND SERVICES

Indications of the increasing acceptance of public ownership and operation of utilities and services were given by a number of municipal developments during the year. In Boston and Chicago, transit lines were taken over by public agencies which will refinance and develop the metropolitan services. San Francisco and Cleveland embarked on transportation system refinancing and modernization programs. Staunton, Va., began the operation of a bus transportation system, and Newark, N. J., began construction of a motor terminal. Forty cities in Alabama, Georgia, and Florida are installing natural gas distribution systems. Thirteen public utility districts in Washington are negotiating for acquisition of property now owned privately. More cities are taking over the operation of cemeteries. Lincoln, Neb.; Escanaba, Mich.; and Higby, Mo., took over cemeteries from private owners, while other cities establishing new cemeteries included Charlotte, N. C.; Klamath Falls, Ore.; Columbia, Mo.; College Station, Tex.; and Keene, N. H. Parking facilities operated as public utilities were innovations in several cities.

HOUSING, TRAFFIC, AND OTHER PROBLEMS

Although legal restraints sometimes make the initiation of a new program difficult, there is evidence that cities can and do assume new functions on demand of their citizens. It appears that, generally, municipal exploration of new fields of governmental endeavor, varying from simple regulatory measures to full operation of service activities, is generally performed by boards and commissions. During the year some cities undertook to alleviate housing difficulties by extending the rent controls initiated by the Federal Government, and assisted in the assembly of land and the financing and construction of dwellings. The vehicle traffic problem, one of the most important and vexatious facing cities, prompted local governments to increase the restricted street areas and provide various types of parking facilities. Flexibility in shifting the emphasis of service also was demonstrated in the localities adopting programs for young people. Cortland, Hudson, and Middleton, N. Y., instituted youth bureaus to coordinate and supplement activities contributing to the welfare and protection of youth, and Yonkers, N. Y., established a juvenile aid bureau in its police department. New York City formed a youth board to coordinate child welfare projects, and a joint state-city agency was set up in Philadelphia to enhance employment opportunities for high school graduates.

FINANCIAL PROBLEMS

Financial problems, including the need for increased revenues, continued to maintain a high priority on the list of significant municipal problems. Rising personal service costs as well as increased prices for materials and equipment continued to affect municipalities adversely, even though many cities were postponing capital improvements in the hope of lower prices in the near future. Recognition of this situation is found in the actions of almost half of the state legislatures in granting new or increased shares of state-collected taxes to local units of government so that, by the end of 1947, there were only four states not sharing state-collected taxes or making grants to other governmental units of the state. There were several examples of state action to broaden the local tax base, an action best exemplified in Pennsylvania, where the legislature authorized other jurisdictions of the state to levy any taxes granted to the commonwealth but not being levied by it. In a less inclusive way several other states authorized local adoption of new taxes, among them Maryland, New Jersey, New York, and Virginia. The sales tax continued to be popular, particularly in California, where the number of cities using this revenue source more than doubled in 1947. Columbus, O. became the fourth city in the country to use the income tax. New Hampshire is now among the states which have withdrawn from the property tax field to leave this source of revenue exclusively to local governments. In a number of cases cities received state aid for streets either for the first time or in increased amounts. New Jersey cities were among these, and in Washington the state will be required to maintain state highways in all towns with a population of 1,500 or less.

In addition to some improvements in local tax structure, a number of actions were taken to facilitate the collection of tax revenues. Some cities, including Bakersfield and Berkeley, Calif., undertook reassessment projects. Both Iowa and Nebraska undertook a positive action to improve assessment practice through the use of county assessors. Wisconsin followed the precedent established by a number of other states by authorizing an *in rem* procedure to enforce tax collection.

PERSONNEL ADMINISTRATION

Confronted with rising salary and wage levels and with the fact that a large proportion of the average municipal budget goes for personal services, municipalities devoted much attention to personnel administration. State and local governments during 1947 employed more people than ever before, and, encouragingly, it was apparent that an increasing number of people showed interest in the public service as a livelihood. There were fewer strikes of public employees in 1947 than in the previous year. A number of states enacted anti-strike legislation with respect to the public service. In a number of instances courts upheld legislation forbidding public employees to join a union. Salaries of state and local employees continued to rise, and by the end of the year a considerable number of cities and counties were using the so-called "cost-of-living adjustment" in relating salaries of their employees to the cost of living index. A significant number of local jurisdictions undertook the development of position classification and pay plans, frequently with outside consulting assistance and probably primarily as a means of working out salary problems. Expansion of the application of the merit principle was found in the establishment of formal merit systems in a number of local governmental jurisdictions.

There were several interesting and perhaps significant developments with respect to certain professional personnel. With the passage of certification bills in New Jersey and New Mexico, the number of states requiring the legal certification of municipal and county librarians was raised to 17. A drive assuming the proportions of a national crusade was effective in materially increasing teachers' salaries, in many instances through the enactment of state legislation fixing minimum teacher pay schedules. The success of this undertaking, launched on a national scale and supported by powerful special interest groups and wide-scale private advertising by press and radio, will undoubtedly suggest to other groups of public employees a new way of lifting salaries in local governments by other than local bargaining efforts. As a novel corollary to teacher pay legislation, New York State is apparently undertaking to establish a system of service rating for teachers in order that meritorious performance rather than solely academic preparation and years of seniority may be given some recognition. This unique venture will undoubtedly be watched with great interest by all public personnel administrators.

Probably one of the most encouraging aspects of personnel administration in local governments during 1947 was found in the vastly increased interest in training activities. Almost every specialized professional group reports greatly increased activity in the training field, and many municipal and statewide training programs were undertaken. Undoubtedly, training still represents one of the most fruitful fields to be cultivated by local governments in the interests of economy and improved services.

PUBLIC HEALTH AND LIBRARY SERVICES

A committee of the American Public Health Association has suggested a plan for creation of some 1,200 local health jurisdictions as a substitute for the existing 18,000 units now administering public health services. The American Library Association's two-year study by its post-war planning committee proposes that public library service be provided by about 1,200 large library systems which would serve the whole population rather than as now by the existing 6,000 or 7,000 libraries which still leave a large proportion of the population inadequately provided for. The coincidence whereby each of these studies arrives at about 1,200 jurisdictions will undoubtedly arouse some speculation on the part of students interested in the question of optimum size and other characteristics of natural administrative areas. Libraries, incidentally, are among those public service functions which are developing new facets. The number of libraries circulating informational films and other audio-visual material is rapidly increasing. The Detroit public library is planning an industrial research service to those firms which are willing to support the maintenance of this service through the device of a non-profit foundation whose board of directors would be the same as the Detroit Public Library Commissioners.

FIRE LOSSES

Sharply increased fire losses in the United States for 1947, plus major fire disasters at Texas City, Tex., and forest fires in New England, pointed again to the desirability of well arranged disaster preparedness plans not only for cities but areas and states. There was substantial activity with respect to the adoption of the revision of municipal building codes, in part by reason of present-day housing problems, and probably in part by reason of safety considerations highlighted by shocking hotel disasters.

WELFARE SERVICES

The increase in the cost to local, state, and national appropriating authorities of welfare services, at a time when employment was high, came unexpectedly to many public officials. This surprise stemmed from the fact that many people are unaware that the number of needy aged persons is continually increasing, both numerically and in proportion to total population; that the closing down of war industries reduced opportunities for work by persons of limited employability; that the post-war breakup of war marriages has left a burden of dependent mothers and children; and that constantly rising living costs also affected recipients of public assistance.

The year 1947 saw continued high activity in the expansion of positive recreation programs in many municipalities. There were several examples of park departments and recreation departments combining into a single agency. As in previous years, apparently the majority of recreation departments which were established were the so-called separate agencies with official boards. The relationship of park, recreation, library, education, and other municipal services was explored in several communities but little real progress was made in changing the patterns now existing as a means of resolving these organizational problems satisfactorily.

INTERNAL ORGANIZATION OF MUNICIPAL GOVERNMENTS

There were many reported instances of positive action to improve the internal organization of municipal governments. One is led to believe that the motivation toward higher standards of governmental organization and services has not been impelled as greatly from the initiative of public officials as from the deficiency in resources to carry on the established routine or by the impatience of the electorate for lack of effective action upon an adopted program. A few of the changes in municipal organization were brought about by the action of state legislatures. A centralized purchasing bureau was authorized in Chicago and established Jan. 1, 1948, as a result of mandatory legislation. Many municipalities utilized the resources of professional associations, leagues, research organizations, and outside consultants to suggest means of improving particular functions.

The reorganizations during the year generally provided for fewer departments by the integration of similar or related functions. Examples of changes also illustrated the increased acceptance of staff services and the strengthening of those services to facilitate management. San Francisco and Los Angeles revised procedures and organization of their planning departments to make them more effective, while Baltimore substituted a department of zoning appeals for the former appeal tax court, board of zoning appeals, and the commissioners for opening streets.

IMPROVEMENTS IN STAFF ORGANIZATION

A few examples of the improvement in staff organization were noted. The Mayor of Denver enlarged his cabinet with two administrative assistants to be responsible for the budget and public relations. A research bureau was instituted in New York City to conduct administrative analyses. The number of reports issued by municipalities displayed the interest of public officials in keeping citizens informed on municipal affairs. Eight cities were reported using radio facilities regularly to publicize their activities. Jackson, Mich.; Pasadena, Calif.; and Kansas City, Mo., conducted courses in courtesy for municipal employees who meet the public in order to improve public relations. Police officers in the Chicago Park District received instruction in minority group relations. New York City opened a school for training key administrative personnel as a means to improve services.

CONSOLIDATION OF OLDER ESTABLISHED FUNCTIONS

More changes were apparent in the consolidations of older established functions. In Newark, N. J., the bureaus of street cleaning and motors were joined into a single bureau of sanitation. The City of New York was considering the possibility of combining the department of sanitation and department of public works into a single unit. New Orleans established divisions of regulatory inspections, traffic engineering, and recreation to take over activities previously performed in several departments. By a similar action, Colorado Springs, Col. created a department of parks and recreation to replace the work of the former golf commission, park commission, and recreation division. Accounting, finance, and clerical activities in Midland, Mich. were brought together in a finance department. San Jose, Calif. recently centralized purchasing. Radio installation and maintenance were centralized in Portland, Ore. The city hospital and health department of Denver were reorganized under a manager of health. Rochester, N. Y., installed a central mailing room under the department of finance. Construction of a central storage yard and garage was authorized in Albert Lea, Minn. Phoenix, Ariz. set up a central payroll department and a centralized warehouse. Water department activities in San Diego, Calif. were centralized under one department head.

Among the larger cities contemplating reorganization are Omaha, Neb.; St. Louis; New Haven, Conn.; Atlanta, Ga.; Denver, Col.; Minneapolis; Oakland, Calif.; and Washington, D. C. The proposed reorganization of Richmond, Va. (subject to legislative acceptance) will eliminate the bicameral council and leave only 14 cities which still cling to that body.

However, the most significant change in municipal governmental machinery lay in the 78 cities and counties which adopted the council-manager form of government in 1947. The adoptions were characterized both by a wide geographical distribution and by a wide range in population and continued the rapid growth of the council-manager plan which occurred in 1946.

Equally encouraging as the increase in the number of council-manager cities was the fact that over two-thirds of the manager appointees were nonresidents and that an even larger proportion had previous experience in public administration, including 57 cases of promotions from one city to another. This combination of circumstances suggests that progress is being made not only in the adoption of administrative structures which are efficient and responsive to public will but in the recruitment and use of competent personnel and in the encouragement of a broader career-service concept in local government.

DIVISION VI

TERRITORIES AND SPHERES OF AMERICAN INFLUENCE

ALASKA

By Ernest Gruening
Governor of the Territory of Alaska

STATEHOOD

The major events in Alaska history in 1947 were involved with continuation of the Territory's drive toward statehood which began late in 1946 when the electorate voted 9,630 to 6,812 in favor of seeking admission to the Union on a basis of equality with the 48 states. Alaska shares with Hawaii status as one of the two organized Territories of the United States. Alaska has been a United States possession since 1867 and a Territory since 1912. Its population (1947 estimate, 91,000) is greater than that of half a dozen of the states at the time of their admission.

A subcommittee of the House of Representatives held a hearing on statehood in Washington in April, 1947 when Governor Ernest Gruening and others from Alaska appeared to urge the granting of statehood. In August and September, committees of both House and Senate visited Alaska and held a series of hearings on statehood. The Territory's Delegate to Congress, E. L. "Bob" Bartlett, has introduced a bill to admit Alaska to statehood.

CONGRESSIONAL AND OTHER VISITORS

Several other Congressional committees visited Alaska during the summer of 1947 seeking information on national defense preparations, airfield construction, public land matters, and pulp and paper production. Other distinguished visitors included Assistant Secretary of the Interior William E. Warne; H. Rex Lee, Acting Director of the Division of Territories; Joseph T. Flakne, Chief, Alaska Branch, Division of Territories; Juan T. Trippe, president of Pan American Airways, Croil Hunter, president, Northwest Airlines; General of the Army Dwight G. Eisenhower, Chief of Staff; General of the Army H. H. Arnold, Army Air Forces; Mayor William F. Devin of Seattle; Mayor H. V. Fawcett of Tacoma; G. Edgar Vaughan, British Consul for the Northwestern States and Alaska; Roberto Regala, Philippine Consul General; Hugh L. Keenleyside, Commissioner, Northwest Territories, Canada. Alaska also was host to 50 editors and writers of hunting, fishing, and outdoor publications, who visited the Territory in connection with the annual convention of the Outdoor Writers of America.

DEFENSE

Work continued on the construction of military installations and airfields, this activity again providing Alaska's largest payroll. Permanent bases were under construction in the Anchorage and Fairbanks vicinities, and new airfields, larger than any previously known in Alaska were started at several points. The Army Air Forces continued regular cold weather experimental training at Fairbanks, and inaugurated regular flights from that point over the North Pole for weather observation purposes. Late in 1947, Major Gen. Howard A. Craig was succeeded as commanding officer of the U. S. Army, Alaska, by Lieut. Gen. N. F. Twining.

FISHERIES

The 1947 canned salmon pack, though relatively small in volume, was the most valuable in the Territory's history, $87,344,728, owing to record high prices. In 1946 its value had been $53,532,679. Progressive decline of the pink salmon catch in southeast Alaska, culminating in almost a total failure in 1947, gave concern to the industry, to the Federal Government, which is charged with conservation of the Alaska fisheries, and to the Territory, which depends on the salmon pack for a large share of its tax revenues. The halibut and herring fisheries were in better straits, and catches were normal. Shellfish volume also was normal, with the important exception that no butter clams were packed in either 1946 or 1947.

MINERALS

Gold production was greater than at any time since the war, but far short of the level reached in 1940 before the mines were closed to release manpower for war production. Figures on total gold production lag considerably behind the calendar, and 1946 figures are the latest available. In that year Alaska produced $6,738,445 worth of gold; 1941 production was $26,178,000. Other minerals produced in 1946 were principally platinum and coal. It was generally recognized that either a decrease in wages and costs or an increase in the price of gold would be necessary before Alaska again entered the lists as an important producer.

FURS

A decline in market prices seriously affected the value of the fur catch taken in the winter of 1946-47. Furs valued at $5,817,673 were shipped to the United States in 1946. Fur seal, mink, beaver, muskrat, marten, otter, and fox were the most important species.

TIMBER

Exploitation of southeast Alaska's extensive forests for pulp and paper production was investigated as an imminent possibility by several concerns, assisted by the United States Forest Service and the Alaska Development Board. Timber units for pulp manufacture were advertised for sale early in 1948. During the year, a dispute between the Forest Service and groups of Indian residents as to ownership of timber threatened to delay location of pulp plants in the Territory. Although Congress passed special legislation designed to permit development to proceed pending settlement of the timber rights, the situation was still uncertain at the year's end. Volume of merchantable timber in the Tongass National Forest of southeast Alaska is estimated at 78,500,000,000 board feet. The principal species are western hemlock, Sitka spruce, western red cedar and Alaska cedar.

AGRICULTURE

Farms in Alaska produced an estimated value of $2,250,000 in dairy products, potatoes, meat, eggs, vegetables, greenhouse products, poultry, and other crops in 1947. The principal agricultural areas are the Matanuska and Tanana Valleys and the Kenai Peninsula.

COMMERCE

Almost all of Alaska's trade is with the United States. In 1946 shipments to the United States totaled $73,775,896 and from the United States, $75,007,229.

TRANSPORTATION

Alaska, with an area of 586,400 square miles, has only 591 miles of railroad, most of it in the government-owned Alaska Railroad connecting the port of Seward on the Gulf of Alaska with Fairbanks in the interior, and serving Anchorage, the

Matanuska Valley, and Mt. McKinley National Park en route. During the year the Alaska Railroad began a four-year program of completely rehabilitating its roadbed and equipment. Road mileage totals 3,200, including portions of the Alaska Highway which are located within the Territory. Approximately 9,000 persons entered Alaska over the Alaska Highway. Construction was begun in 1947 on new roads on the Kenai Peninsula and in the Fortymile country. A new company began common carrier service by barge to the Alaska Railbelt. In May, 1947, rates by water advanced by 67 per cent over pre-war levels, and the United States Maritime Commission began an investigation of the steamship companies serving the Territory from Seattle.

GOVERNMENT

The regular biennial session of Alaska's Legislature met at Juneau, the capital, in January, February, and March. The Legislature enacted a blanket primary law, petitioned Congress to grant statehood, and passed appropriations which exceeded anticipated revenues by approximately $3,500,000 for the biennium. Revenues for 1947-49 are estimated at $6,686,000. Since appropriations totaled $10,159,183.90 and since the Organic Act which Congress passed respecting goverment in Alaska prohibits the incurring of a debt, the Territorial Board of Administration is regulating expenditures in order to stay within income.

EDUCATION

In the 1946-47 school year, the Territory supported 70 public elementary schools, whose enrollment was 7,297, and 24 high schools, enrollment 1,451. In addition, 96 day schools, with enrollment of 3,636, and three boarding schools, enrollment 870, were maintained by the Alaska Native Service, a Federal agency, for the Indian, Eskimo, and Aleut children of Alaska. The University of Alaska, located at College, Alaska, near Fairbanks, offers four-year courses in agriculture, arts and letters, business administration, chemistry, civil engineering, education, general science, home economics, mining, and pre-medicine. Its enrollment in the 1946-47 year was 334.

OTHER EVENTS AND DEVELOPMENTS

Population continued to increase. New land was opened to settlement. Northwest Airlines began regular service to the Orient *via* Alaska. A disastrous fire burned timber on a large area of Kenai Peninsula during the summer. Sharp earthquake shocks were felt at Fairbanks in October, but damage was negligible. Alaska's worst aviation accident occurred late in October when a Pan American Airways plane struck a mountainside in bad weather near Ketchikan, killing 18 persons.

HAWAII

By Ingram M. Stainback
Governor of the Territory of Hawaii

DESCRIPTIVE

The Territory of Hawaii is a group of eight large islands and numerous islets in the Pacific Ocean, situated 2,091 miles southwest of San Francisco. The land area, 6,435 square miles, is larger than the states of Connecticut, Rhode Island, or Delaware. The Islands are of volcanic origin. From southeast to northwest they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching northwestward beyond Niihau more than 1,000 miles, is an archipelago of rocks, reefs, and shoals which include Midway. Likewise, 960 miles south of Honolulu and part of the City and County of Honolulu lies Palmayra, a coral atoll.

HISTORY

For more than a century Hawaii has had constitutional government. There was an American settlement in Hawaii before there was one in California. By the time the Islands were annexed in 1898, they were intrinsically American. Now, 47 years later, the Territory is emphasizing her readiness for statehood.

During the economic, political, and social changes of the twentieth century in the United States, Hawaii's legislature has enacted legislation comparable to that of many states. During 1947, for example, the Legislature of Hawaii created an Aeronautics Commission, a forward step taken by only a few mainland areas.

Hawaii's standard time was advanced 30 minutes to place the time zone of the Territory two hours behind Pacific Coast time.

STATEHOOD MOVEMENT

After 47 years as a Territory, Hawaii approached closer to achieving statehood than it has at any other time since annexation as an integral part of the United States. Hawaii's statehood bill (H. R. 49), introduced by Delegate Joseph R. Farrington into the 80th Congress, was one of 11 identical Hawaii statehood bills introduced in January by Congressmen representing all major sections of the country. In March, the House Public Lands Committee heard testimony from such prominent citizens as Secretary of Interior Julius A. Krug, Admiral Chester W. Nimitz, Major General Herron (ret.), and the Governor of Hawaii, Ingram M. Stainback. No witnesses appeared in opposition to the statehood bill. On March 19, the House Committee unanimously recommended immediate statehood for Hawaii. The House of Representatives, on June 30, by a vote of 196 to 133, passed a Hawaii statehood bill for the first time in history. The bill is before the Senate where action is expected during the Second Session of the 80th Congress.

AREA AND POPULATION

For administrative purposes, the Territory is divided into five counties as follows: City and County of Honolulu comprising the Island of Oahu (area 604 sq. mi., estimated population 1947, 360,274); County of Hawaii, comprising the Island of Hawaii (area 4,030 sq. mi., population 73,690); County of Maui, comprising the islands of Maui, Lanai, Kahoolawe, and all of Molokai, except the leper settlement (area 1,164 sq. mi., population 55,904); County of Kauai, comprising the islands of Kauai and Niihau (area 627 sq. mi., population 35,194). The total area is 6,435 sq. mi., population 525,477. The principal cities are Honolulu, the capital, situated on the Island of Oahu, population 268,913, and Hilo, on the Island of Hawaii, population 29,111.

The population of the Territory grew from 423,330 in 1940 to an estimated 525,477 in 1947, exclusive of military and naval personnel. The population is greater than that of any state at the time of admission to the Union, with the exception of Oklahoma. As compared with the several states at the time of the 1940 census, Hawaii exceeded the population of Nevada, Wyoming, Delaware, and Vermont, and its population was comparable to that of four other states—New Hampshire, Arizona, Idaho, and New Mexico. The racial origin of this population, in addition to the native Hawaiians and the Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. However, citizens of the United States constitute 86 per cent of the population.

GOVERNMENT

During the greater part of the nineteenth century, the islands formed an independent kingdom, but in 1893 the reigning Queen Liliuokalani was deposed and a provisional form of government was proclaimed. Pursuant to the request of the people of Hawaii, expressed through the Legislature of the Republic, and a resolution of the United States Congress approved July 7, 1898, the islands were formally annexed to the United States Aug. 12, 1898. The Organic Act, under which Hawaii is governed, was approved April 30, 1900, since which date the Hawaiian Islands have been functioning as a full-fledged territory and an integral part of the United States.

Executive power is vested in the Governor, who is appointed by the President by and with the advice and consent of the Senate of the United States. The Hawaiian Organic Act provides that, in order to be eligible for appointment to the office of Governor of Hawaii, one shall have resided in Hawaii for at least three years next preceding appointment. The Secretary of the Territory, who becomes Acting Governor, is also appointed by the President by and with the advice and consent of the Senate. There is a legislature of two houses: a Senate of 15 members elected for terms of four years and a House of Representatives of 30 members elected for terms of two years.

Hawaii is represented in Congress by a Delegate, elected biennially. He has the right to debate and may be a member of committees of the House of Representatives but has no vote.

TRADE

The two largest industries in Hawaii are sugar and pineapple. The 1946 sugar crop had an approximate value of $62,444,670; canned pineapples and pineapple juice, and fresh pineapple $60,000,000; tourists $21,000,000; and coffee $1,028,000. Hawaii purchased from the continental United States goods valued at $227,096,301, and sold to the mainland goods valued at $132,698,983.

Overseas vessels arriving and department from ports of the Territory in 1946 numbered 942. This shipping amounted to 6,889,316 gross tons, or 4,111,540 net tons.

AIR TRANSPORT

The Hawaiian Airlines, Limited, began its seventeenth year of commercial air service, and transported 250,585 passengers, a total of 2,116,108 air miles in 1946 compared with 159,803 passengers flown, a total of 1,239,102 miles in 1945. Both Pan American World Airways and United Airlines have daily flights to and from Hawaii and the Mainland, as well as flights to the Orient. In one recent month (October), more than 8,000 persons traveled by air to the Hawaiian Islands.

BUSINESS AND INDUSTRY

Building permits for all kinds of construction for the calendar year 1946 in Honolulu totaled 7,470, with an estimated value of $23,020,734, an all-time record. New construction in 1946 had a value of $17,947,483, compared with the 1945 volume of $8,194,928. There were estimated to be 58,500 families in Honolulu in June, 1946, and only 46,500 dwelling units, or a shortage of 12,000 dwelling units.

Reports of business and official agencies at the end of 1945 showed business to be in a strong financial position. As of December 1946, 38,047 business enterprises were operating, compared with 36,868 in 1945. Wages paid in 1946 decreased to $382,505,553, compared with $402,298,992 in 1945. Postal receipts in Honolulu for 1946 were $12,817,881, a decrease of $8,703,706 over 1945.

SUGAR

The 30 sugar companies operating in the Territory are capitalized for approximately $175,000,000. Some 16,000 persons own stock in these companies. About half of the land planted to sugar cane is owned by the plantations; the balance is leased from estates, from the Territorial Government, and from individuals. The sugar crop for 1946 totaled 680,073 short tons, valued at $62,444,670. Hawaii normally supplies about 14 per cent of the national needs. The National Sugar Act of 1948 provides for a quota of 1,052,000 tons for Hawaii. The 1946 sugar harvest was the lowest since 1902, only 84,379 acres being cut because of the 79-day strike late in the year. There were 212,226 acres planted to sugarcane in 1946. There were 28,598 persons employed on sugar plantations as of December 1946. Hawaii pays a wage scale higher per day on a year-round basis than any other agricultural area anywhere.

PINEAPPLES

Eight pineapple companies in Hawaii operate 12 plantations and nine canneries, producing about 90 per cent of the world's supply. Approximately 63,000 acres of land in the Territory is utilized for pineapple production. Pineapple agricultural labor, excluding the canneries, totals about 14,750, while 11,300 are employed in the industry's manufacturing operations. These figures exclude employees of the harvesting season from June to September, when an estimated 35,000 persons are employed. The total pack of eight member companies of the Pineapple Growers Association of Hawaii for the fiscal year 1946 was 17,722,102 cases. During 1946, 378,514,738 pounds of canned pineapple, valued at $40,537,968; 23,933 boxes of fresh pineapple, valued at $61,682; and 34,636,856 gallons of pineapple juice, valued at $21,487,228, were shipped to the mainland.

COFFEE

Coffee production for the crop year 1946 was 6,300,000 green pounds compared to 7,656,048 pounds in 1945. Coffee ranks third in Hawaii's exports, with an approximate value, in 1946, of $1,028,000. Commercial production is confined to about 4,000 acres in the Kona area on the Island of Hawaii.

FINANCES

Territorial tax collections on business and otherwise for 1946 amounted to $42,356,209, as compared to $41,272,600 for the previous year. Cash on hand and in banks on Dec. 31, 1946, amounted to $32,555,952 as compared with $36,798,496 at the beginning of the year.

The gross bonded indebtedness, as of June 30, 1947, amounted to $10,996,000. The net bonded indebtedness, after the deduction of sinking fund assets of $2,973,326, amounted to $8,022,674, as compared with $28,511,458 in 1939, a decrease of nearly 72 per cent in eight years.

The net assessed valuation of real and personal property reached its highest peak in 1946. Real property was valued at $551,285,163, as compared with $500,493,838 for the year 1945. The total value of real and personal property was $689,557,809.

Total deposits in the four banks and 38 branches in Hawaii, on Dec. 31, 1946, amounted to $477,538,912, as compared with $105.984,466 ten years ago on Dec. 31, 1936.

The total internal revenue collections in Hawaii for the fiscal year 1947 exceeded the total collections of any one of 12 states, being 106,314,370.

ARMED FORCES

Naval personnel of the 14th Naval District averaged 14,500 officers and enlisted men during 1946, compared with 43,200 in 1945. Civilian employees in the district numbered 18,000. Navy military payroll totals in Hawaii were approximately $85,000,000. The value of business with local merchants for supplies and provisions approximated $4,500,000 in 1946.

Army personnel in the Hawaiian area averaged 30,000 in 1946, compared with 135,000 in 1945. Total military payroll for the period was $37,049,139. The average number of civilian employees of the War Department was 18,000, contrasted with 26,000 a year previous. Gross annual pay of these employees was $57,436,246. Local purchases by the Army Exchange Service amounted to $2,828,589 during 1946. Total local expenditures by the Army in 1946 were estimated to be $124,000,000.

PUERTO RICO

By JESÚS T. PIÑERO
GOVERNOR OF PUERTO RICO

DESCRIPTIVE

The Island of Puerto Rico is the smallest and most easterly of the four Greater Antilles. These islands, together with the Lesser Antilles, form a chain of some 200 islands which reach from the tip of Florida to the northeast coast of Venezuela. San Juan, capital of Puerto Rico, is about 1,600 land miles southeast of New York, 1,000 miles southeast of Florida, and about 1,000 miles northeast of the Panama Canal.

Puerto Rico is approximately 100 miles long by 35 miles wide. With its three small satellite islands of Vieques, Culebra, and Mona, its territory contains 3,435 square miles, almost three-quarters of which is in the mountainous interior. Puerto Rico is in the sub-tropics, but continuous trade winds give it a moderate all-year temperature averaging 76° F. Rainfall is heavy throughout the year except in certain sections on the south coast where crops are grown under irrigation.

HISTORICAL

The Island was discovered by Columbus Nov. 19, 1493, on his second voyage. In 1508, it was conquered by the Spaniards, and its Indian name "Borinquen" was changed to Puerto Rico (Rich Port). Puerto Rico continued under Spanish rule for almost 400 years. It was ceded to the United States Dec. 10, 1898, at the end of the Spanish-American War.

POPULATION AND LANGUAGE

In 1947, Puerto Rico had an estimated population of 2,200,000. San Juan, on the north coast, is the largest city with an estimated population in 1947 of 225,000. The second and third largest cities are Ponce on the south coast with an estimated population of 118,000, and Mayaguez at the western end of the Island, with an estimated population of 90,000 inhabitants.

Spanish continues to be the mother tongue of Puerto Rico, although English is taught in the schools. The official language is English, and most commercial correspondence with the mainland is carried on in English.

GOVERNMENT

The Island is governed under the Act of Congress of March 2, 1917, known as the Organic Act, and subsequent amendments. Heretofore, the key officers of the government—Governor, Commissioner of Education, Auditor, Attorney General, and Judges of the Supreme Court have been appointed by the President of the United States. Under the 1947 amendments to the Organic Act, the Puerto Ricans will elect the Governor in the elections of 1948. The Judges of the Supreme Court and the Auditor will continue to be appointed by the President and all other officials will be appointed by the Governor. Other departments include Health, Interior, Treasury, Agriculture and Commerce, and Labor.

On July 25, 1946, President Truman nominated Jesús T. Piñero, then Resident Commissioner, to the Governorship of the Island. Piñero was inaugurated Governor Sept. 3, 1946, marking the first time under either Spanish or United States jurisdiction, that a native-born Puerto Rican has been named Governor. Dr. A. Fernós-Isern was appointed Resident Commissioner to fill Piñero's unexpired term.

Puerto Ricans elect the legislature which is made up of 19 Senators and 39 Representatives. They also elect a Resident Commissioner to the United States Congress who may participate in debate and be a member of various committees but has no vote. Elections are held at four-year intervals and on the same day as national elections. The Island is divided into 77 municipalities, each with its own mayor and Council whose acts are subject to review by the Executive Council, composed of the Governor, Attorney General, Commissioners of Health, Interior, Agriculture and Commerce, Finance, and Labor. In the November 1944 elections, the Popular Democratic Party, under the leadership of Luis Munoz Marin, President of the Senate of Puerto Rico, gained overwhelming control of both houses of the legislature. Governor Piñero and Commissioner Fernós-Isern are members of the Popular Democratic Party.

JUDICIARY

The judiciary system consists of the Insular Supreme Court, the District Court of the United States for Puerto Rico, the district and municipal courts, and justices of the peace. Appeals may be made in certain cases to appropriate higher courts, including the Supreme Court of the United States. The Chief Justice and four Associate Justices of the Supreme Court of Puerto Rico are appointed by the President, by and with the consent of the U. S. Senate. Statutory laws of the United States, not locally inapplicable, are in effect in Puerto Rico unless otherwise provided.

REPRESENTATION

Puerto Ricans are American citizens but may vote in Presidential elections only if they are residents of the mainland. They send no representatives to Congress but are represented in Washington by a popularly elected Resident Commissioner who has the right to debate, hold committee assignments, and introduce bills, but does not have the right to vote.

POLITICAL STATUS

Puerto Rico has been held by the Supreme Court to be unincorporated territory of the United States—in other words, "belonging to but not a part of." The present political status is unsatisfactory to Puerto Ricans. In October 1945, President Truman recommended that, since the existing form of government in Puerto Rico seemed unsatisfactory to a large number of its inhabitants, Congress should enact legislation to submit various alternatives to the Puerto Rican people in order that they might have an opportunity to express their desires concerning their political future. The following alternatives were suggested by the President: (1) the right of the Puerto Ricans to elect their own Governor with a wider measure of local self-government, (2) statehood, (3) complete independence, and (4) a dominion form of government. A bill incorporating these suggestions was introduced; however, it was not reported out of Committee. In the 1947 amendment to the Organic Act, provision was made whereby the people of Puerto Rico will elect their own Governor in the 1948 elections.

FEDERAL ACTIVITIES IN PUERTO RICO

Almost all major Federal government agencies include Puerto Rico in their fields of activity. The most important exception is the Social Security Act. Only the Child Welfare and Public Health sections operate in the Island. The Federal Government has occasionally provided special programs of which the most outstanding was the Puerto Rico Reconstruction Administration, established in 1935 by Executive Order to stimulate employment within Puerto Rico.

Administrative jurisdiction of Puerto Rico is under the Department of the Interior, and the Governor of Puerto Rico makes his annual report to the Secretary of the Interior.

Although Puerto Ricans, with few exceptions, pay no Federal income taxes, the Island receives limited Federal aid similar to the states. In addition, the Internal Revenue Taxes collected on Puerto Rican manufactures sold in continental United States are turned back to the Insular Treasury.

Puerto Rico is inside United States tariff walls which results in great dependence on the mainland both as a market for exports and a source of imports. It is one of the largest customers of the United States in the Western Hemisphere. Puerto Rico is also subject to the coastwise shipping laws which prohibit the Island from shipping to and from continental United States and between ports on the Island in foreign boats.

ECONOMIC SITUATION

In 1947, Puerto Rico had an estimated population of 640 persons per square mile. It is one of the most densely populated agricultural countries in the world. In addition, large areas of the Island are mountainous and are useless for agricultural cultivation. This lack of balance between population and resources accounts for the continued low standard of living for at least two-thirds of the population.

Puerto Rico has three principal remunerative crops—sugar, tobacco, and coffee—of which sugar is by far the most important. In 1947, 1,087,881 tons of sugar were produced in Puerto Rico. The Sugar Act of 1948 sets the 1948 quota for shipment of sugar to the continental United States at 910,000 tons. Although coffee exports have dwindled to practically nothing, the industry is still of great economic importance and ranks second to sugar cane in area of cultivation. To overcome the threat of hurricanes, which in 1928 and 1932 practically demolished the coffee plantations, the Insular Government in 1945 set up a plan of insuring both crop and plantations. In 1947, payment of subsidies to coffee growers and workers was approved by the Island's legislature.

A decline in the production of rum was brought about by the overstocked condition of the markets in the continental United States.

HEALTH

The birth rate increased in 1946 to 42.8 live births per 1,000 population as compared with 42.3 in the previous year. The death rate fell from 14.1 per 1,000 population in 1945 to 13.3 in 1946. The School of Tropical Medicine in San Juan is the leading American research school for tropical diseases.

EDUCATION

There is a serious shortage of both schools and teachers in Puerto Rico, but enrollment in public schools continues to increase. School enrollment in 1947 was 460,000, an increase of 110,085 over the previous year. There are 300,000 children who can not go to school because of lack of schools. Illiteracy has been reduced to 29 per cent; $23,000,000 were appropriated for education during the fiscal year 1946-47. The University of Puerto Rico, located in Rio Piedras, had a total enrollment of 8,265 in 1946-47.

The language problem in Puerto Rico is a very serious one. A bill providing that teaching be done in Spanish, with English as a required subject, was passed by the 1946 legislature over the Governor's veto and sent to the President, as required in the Organic Act, who upheld the veto.

LABOR

Organization of labor has progressed rapidly in recent years. There are two Island-wide labor organizations—Free Federation of Labor, formed in 1899, affiliated with the American Federation of Labor, and General Confederation of Workers, formed in 1940. In 1945, the Confederation split into two factions, each retaining the parent name.

Wages in Puerto Rico are higher than elsewhere in the Caribbean for both industrial and agricultural workers. Minimum wage rates are established under both Federal and Insular legislation. Although wages have risen to an all-time high, they have barely kept up with increased living costs and are still below United States standards. Despite this, there were no serious labor disputes in Puerto Rico in 1947.

INDUSTRIAL DEVELOPMENT

Realizing that increased industrial development is necessary to help solve Puerto Rico's economic problems, the Insular Government, on May 11, 1942, established the Puerto Rico Industrial Development Company to establish and operate industries on behalf of the Government and to help finance, and assist private industry. In 1947, factories under the Company's direction included glass container and cement plants, which use native sand, clay, and limestone, and a pulp and paper plant which manufactures paperboard from waste paper. There are also a clay products plant, shoe and leather factories, and a textile mill.

The Puerto Rico Development Bank, created by the Insular Legislature in 1942, is closely associated with the industrialization program. This bank has three primary functions: (1) to carry on refinancing operations of various kinds; (2) to act as a central institution through which all financial operations of the Insular Government can be managed; and (3) to help finance the long-range industrial development of the Island, through the Development company and private business.

AGRICULTURE

Puerto Rico's only important natural resource is land. A primary objective, therefore, is to intensify and expand land uses. On April 24, 1945, the legislature created the Agricultural Development Company, with authority and funds to develop to the utmost the commercial possibilities of the Island's agriculture.

Various other Federal and Insular government agencies are at work on the problem of making the best use of the land. Three research centers —Agricultural Experiment Station of the University of Puerto Rico, Federal Agricultural Experimental Station, and Institute of Tropical Agriculture—carry on research to develop better plant strains and improve production techniques.

Another important aspect of the Government's program is soil conservation. In March 1946, the legislature passed the Soil Conservation Districts Act, providing for the creation of soil conservation districts and authorizing such districts to adopt programs and regulations for the protection of land against soil wastage and erosion.

LAND PROGRAM

Because the land area of Puerto Rico is so limited, in relation to population, and because land ownership has been concentrated in the hands of a comparatively small group, the question of land ownership and land use is supremely important. The Insular Legislature, in the Land Act of 1941, implemented the Joint Resolution adopted by Congress in 1900, since incorporated into Puerto Rico's Organic Act, providing that no corporation or partnership engaged in agriculture on the Island may own or control more than 500 acres of land.

The Land Act established the Land Authority to purchase land, primarily from owners of more than 500 acres and directed distribution of such land in three ways: (1) in plots of from one-quarter cuerda to three cuerdas (one cuerda is slightly less than one acre) to landless agricultural workers (agregados); (2) in parcels of from five to 25 cuerdas to individual farmers as family sized farms; and (3) in large farms of from 100 to 500 acres which are leased to experienced farmers to be operated on a proportional profit basis. Laborers on these farms share in the profits, in addition to receiving regular wages for their work.

FINANCES

General fund collections were estimated at $82,249,632 for the year ended June 30, 1946; trust funds, $49,244,261. Revenue from the shipment of rum to the mainland diminished sharply from the level of the previous year, and was a negligible source of governmental income for the year. Inflation, however, of incomes brought about a substantial increase from Insular income taxes.

LEGISLATION

In the year 1947, the Insular legislature created a division within the Department of Labor to administer a protective program for workers who desire to migrate to the mainland. The Legislature expressed itself as not interested in either encouraging or discouraging migration but only in preventing maladjustments and exploitation of migrants.

It also provided for a complete exemption from Insular personal and corporation income taxes for 12 years, and a partial exemption from excise and realty taxation, for "new" enterprises, as defined by law, in order to encourage development of industry for local and export markets.

ECONOMIC AND SOCIAL PLANS

Puerto Rico's problems are mainly economic. It has a rapidly increasing population and inadequate income production. The program of the present Administration is to intensify the use of resources and to develop new methods of increasing income as well as to improve and extend social services, which are at present far below the accepted minimum standards.

The accomplishment of this program depends upon careful budgeting of government income. Responsibility for evolving a financial program to insure the best use of Insular Government funds lies with the Puerto Rico Planning Board, which was established May 12, 1942. The Board each year submits to the Governor and the Legislature a six-year plan or financial program which serves as a guide for appropriations.

THE VIRGIN ISLANDS OF THE UNITED STATES

By William H. Hastie

Governor of the Virgin Islands of the United States

DESCRIPTION

The most recent of United States possessions, the Virgin Islands, formerly known as the Danish West Indies, were acquired by purchase from Denmark in 1917 for $25,000,000. This price represents the highest paid for any territorial possession of the United States, but was considered reasonable at the time in the light of military and strategic necessity.

This group comprises three islands: St. Croix, 82 square miles in area, with an estimated population of 13,000 in 1946; St. Thomas, 32 square miles with an estimated population of 16,200; St. John, 19 square miles, with a population of 800 and approximately 50 smaller uninhabited islands. The islands lie approximately 1400 miles southeast of New York and 39 miles east of Puerto Rico. The seat of government is at Charlotte Amalie on the island of St. Thomas, whose harbor is one of the finest in the Caribbean. The Governor and the Government Secretary are appointed by the President, while the Administrator for St. Croix and other heads of departments are appointed by the Secretary of the Interior. The two municipalities of St. Thomas—St. John and St. Croix, corresponding to the three largest islands—each elects a Municipal Council by universal suffrage with power over municipal finances subject to review by the Governor. These Councils also confirm the Governor's appointments of municipal officers. The present Governor is William H. Hastie who succeeded Charles Harwood May 17, 1946.

EDUCATION

The public school enrollment in St. Thomas is 2,624 of which 785 pupils are enrolled in the junior and senior high school grades. In St. Croix the enrollment is 1,570 with about 361 pupils in high school grades. The average annual expenditure per child in St. Thomas is $79.62. In St. Croix the average cost per pupil is $52.59. The average salary of teachers in St. Thomas is $1,400 per annum and in St. Croix $1,035.

FINANCE

The revenues of the Municipality of St. Thomas and St. John were $817,898.53 compared with $862,396.95 in the preceding year. Budget expenditures were $1,121,306.94. Income tax collections were $511,870.18 as compared with $622,573.27 in the preceding year. The revenues of the Municipality of St. Croix were $273,026.86 as compared with $262,257.54 in 1946. Budgeted expenditures were $428,226.86. Congress appropriated $135,000 toward the expenses of local government in St. Croix. Income tax collections there amounted to $86,232.22 as against $103,069.94 in the previous year.

TRADE AND COMMUNICATION

Shipping improved steadily during the year. There are now regular schedule calls of tourist ships of the Alcoa and Delta Lines. Calls at the port of St. Thomas are becoming more frequent after wartime suspension. Three hundred and sixty ocean-going vessels with a gross tonnage of 2,631,887 entered St. Thomas harbor as against 353 with a gross tonnage of 1,493,725 in 1946. The volume of shipping is still considerably lower than the pre-war years. Imports into the Virgin Islands from the United States during the calendar year 1946 totaled approximately $1,782,577; exports from the Virgin Islands to the United States for the same period amounted to approximately $750,987.

A steady flow of passengers is maintained by the Pan American Airways and Caribbean Atlantic Airlines which serve the islands with two daily flights. St. Thomas and St. Croix are adequately provided with roads. A few miles of roads have been developed in St. John. There is radio telephone service among the three islands, and with continental United States through Puerto Rico since 1946.

THE SUGAR INDUSTRY

The growing and processing of sugar cane and its allied industries and the business derived through harbor activities in St. Thomas constitute the economic life of the islands. The rum industry which did such a profitable business during the war years is now on the decline. Exports in 1947 amounted to 244,809 proof gallons from St. Thomas and 146,071 proof gallons from St. Croix as against a total of 955,049 proof gallons in 1946.

St. Croix produces the entire sugar crop of the islands. This basic industry suffered seriously during the year because of severe drought. Despite increased acreage and higher prices through subsidies the yield at the end of the year dropped from 47,160 tons in 1946 to 36,304 tons in 1947 and with a corresponding reduction in sucrose content from 4,970 tons in 1946 to 2,946 tons in 1947.

TOURISM

Plans are on foot to develop and construct additional facilities for the accommodation of tourists. There is every indication that very substantial revenues could be derived through this source. All available hotels are crowded to capacity with bookings far in advance.

ECONOMIC PLANS

Great emphasis is now being laid on the need for greater production and consumption of local products. The Department of Commerce and other local agencies are developing plans which might help to solve this situation.

The Federal Public Works Program, delayed considerably because of material shortages and inadequate shipping facilities, is now under way. Extensive surveys and supervision in all fields conducted by the Federal Works Agency are carried on simultaneously with the view of starting projects as soon as materials and equipment are available.

There are a number of favorable factors in the financial and economic trends which with proper co-ordination and management would indicate an improvement in future economic conditions.

THE VIRGIN ISLANDS COMPANY

The Virgin Islands Company is a government corporation chartered by the Municipal Council of the Municipality of St. Thomas and St. John for the purpose of managing and operating certain lands, buildings, and factories owned by the United States with the view of effecting the economic rehabilitation of the people of the Virgin Islands by revitalizing agriculture and industry.

During the fiscal year ended June 30, 1947, the Company ground 36,304 tons of sugar cane of which 14,637 tons were purchased from Federal Homesteaders and small growers. This in turn produced 2,946 tons of raw sugar and 99,858 gallons of cane syrup for the manufacture of rum. The Company also manufactured 241,714 proof gallons of rum, with an excess of 527,657 proof gallons aging in the Company's warehouses.

The Company is still the largest employer of labor in St. Croix with a payroll varying from 500 to 1,500 persons, according to the season of the year. The current wage of the Company's agricultural labor $2.00 per eight-hour day is the highest in the history of the Virgin Islands.

While the year 1947 was the most difficult in the Company's history because of severe droughts and a reduction in the sugar crop to approximately 60 per cent of anticipated production, the Virgin Islands Company continues to stand between the people of St. Croix and destitution.

GUAM AND AMERICAN SAMOA

By William E. Neely
Lieutenant USN; Office of the Chief of Naval Operations, Navy Department

GUAM—DESCRIPTIVE AND HISTORICAL

Guam, the largest island in the Marianas group, is situated in mid-Pacific 1,500 miles east of Manila, 1,300 miles south of Japan, 3,337 miles from Honolulu, and 5,053 miles from San Francisco. It is volcanic in origin and has an area of 217 square miles. The southern part of the island is high and mountainous with a range of hills along the west coast from 700 to 1,300 feet high. The northern part is a plateau, ranging from 200 to 600 feet in elevation, and the soil, though fertile, is very shallow.

Generally, the climate of Guam is pleasant. The average yearly rainfall is 69.13 inches, 65 per cent of which falls in July and September. The minimum temperature is about 70 degrees and the maximum about 90 degrees. The island is in the typhoon belt of the western Pacific and occasionally is visited by severe storms.

Guam was discovered by Magellan in 1521 and for many years thereafter was an important stopping point for Spanish ships plying between Mexico and the Philippines. In 1898, at the close of the Spanish-American War, it was ceded to the United States and was placed under the control of the Navy Department by Executive Order. It was invaded by the armed forces of Japan Dec. 10, 1941 and was occupied by the Japanese until the re-entry of United States forces in July 1944. After the island was declared secured on Aug. 10, 1944, at the cost of 1,353 marines killed and many thousands wounded, thousands of United States military personnel and native Guamanians began the colossal task of transforming Guam into a fortress and staging area for the final assault against Japan. Within one year Guam became one of the most powerful of American advanced bases in the Pacific.

Guam now is in the process of being rebuilt and remodeled. The magnitude of the task can best be appreciated by taking into account that all the 1,750 homes in the capital city of Agana were destroyed, and the towns of Sumay, Agat, Piti, and Asan were almost completely demolished by combat operations during the war.

THE PEOPLE OF GUAM

The natives of Guam are called Chamorros. The origin of the ancient Chamorros is obscure, but it is probable that they are a group that became detached and isolated in the Marianas Islands from the Prot-Malays in their migration eastward from the mainland of Asia. By reason of wars, storms, and pestilence the estimated population of 50,000 in the early days of Spanish rule had decreased to 9,630 in 1901, according to a census taken at that time by the Naval administration. A vigorous campaign in the field of public health and sanitation was instituted by the Naval government with the result that the indigenous population had increased to 24,268 as of July 1, 1947. (In addition the average transient or off-island population of Guam consisting of military personnel and their dependents, contract and civil service employees, and other off-island persons is 55,000.) While English is the official language of the government and of the schools, the native Chamorro language is widely spoken in the daily life of the people. The predominant religion is Roman Catholicism. Throughout the Japanese occupation the people remained completely loyal to the United States and cooperated with its military personnel in harassing the Japanese.

GOVERNMENT

Guam is a possession of the United States. The inhabitants are not United States citizens but are citizens of Guam and nationals of the United States. While the U. S. Constitution does not extend to Guam, most of the guarantees of the Bill of Rights have been secured to the Guamanians.

A senior naval officer is commissioned by the President as Governor of Guam and the same officer is designated by the Secretary of the Navy as Commander, Marianas Area, and Island Commander, Guam. The government is administered by departments, at the head of each of which is a naval officer or a civilian specialist responsible to the Governor and assisted by Guamanian civilians. The Guam Congress, composed of a House of Council and a House of Assembly, is elected by the citizens of Guam without regard to race, color, or sex. Prior to Aug. 4, 1947 the Guam Congress acted in an advisory capacity only to the Governor. On that date the Secretary of the Navy by proclamation vested certain legislative powers in the Guam Congress. Pursuant thereto legislation passed over veto of the Governor goes to the Secretary of the Navy for final decision.

The judicial system of Guam consists of the Court of Appeals composed of a civilian Chief Justice from the United States appointed by the Secretary of the Navy and of four Associate Justices, two of whom are Guamanian citizens and the remaining two of whom are military officers with legal training and background; of the Superior Court established by the act of the Guam Congress Nov. 1, 1947 and presided over by the Chief Justice of Guam; and of the Island Court, the Justice Court, and the Police Court, all of which are presided over by Guamanian judges.

Rear Admiral Charles A. Pownall, USN, was inaugurated Governor of Guam on May 30, 1946 and is now serving in that capacity.

BUSINESS AND INDUSTRY

Guam has never been a very productive island. The natural resources are of no commercial significance. All forms of business and agriculture were disrupted by the war. The gathering of copra (dried coconut meat), formerly the chief industry of Guam, has almost ceased. A few small industrial plants, such as one soap factory, one ice plant, one ice storage shed, and two soft drink bottling concerns, provide a limited source of income for the island.

At the end of the fiscal year 1947, there were 587 small business enterprises owned and operated by Guamanians with annual gross sales of $938,600. For the most part however, the island population earns its livelihood from employment by the United States Government. As of Dec. 31, 1946 a total of 3,104, or 25 per cent of the Guamanian population over the age of 16 years, were employed in this manner. Payrolls for the six months period ended Dec. 31, 1946 aggregated $1,117,026.40. The Guam Department of Agriculture has made an effort to stimulate farming on Guam as a means of supplementing the food supply of the island. At the present time, however, Guam may be likened to a city of 80,000, as dependent upon off-island sources for food and other necessities as a comparable city in the United States would be dependent upon sources beyond its corporate limits. The banking needs of Guam are adequately met by the Bank of Guam which reported total resources of $10,172,115.55 as of the close of 1946.

EDUCATION

At the end of the war it was necessary to rebuild every school building on Guam. Twenty-two have been completed. A professional educator from the mainland is employed as superintendent of schools, and other mainland educators are provided for those positions for which qualified Guamanians are not available. Of the 212 teachers employed in the school system, 190 are Guamanians. The total enrollment is 7,594, and the proportion of enrollment to population of school age is estimated at 95 per cent. The percentage of literacy, according to the 1940 census, was 84 per cent. One year of college level work is offered in the Normal Training Course instituted on Guam in September 1946. In the summer of 1947 the University of Hawaii conducted a branch session on Guam, offering credit courses for Guamanian teachers. Several Guamanians are attending colleges in the United States and Hawaii. An active program of vocational training is now in operation in the school system with 653 persons participating.

MEDICAL CARE AND HEALTH

Upon the return of the United States forces to Guam in 1944, vigorous action was taken to provide greatly needed medical care for Guamanians and to reinstitute a program of public health and sanitation. Accordingly, upon the cessation of combat operations on the island, a hospital for the Guamanian people was provided at the site of one of the Navy fleet hospitals, and on March 15, 1946 it was designated the Guam Memorial Hospital in honor of Guamanian fervor and loyalty in support of the Allied cause. This hospital, having a capacity of 300 beds, is being used on an interim basis until permanent facilities can be constructed. Other medical facilities provided include a school for native medical practitioners, a school for native nurses, and a school for native dental practitioners. A comprehensive public health program now is functioning smoothly. The steady increase of the indigenous population of Guam from 9,630 in 1901 to 24,268 in 1947 attests the general high standards of sanitation and medical care maintained on the island.

LEGISLATIVE AND OTHER DEVELOPMENTS IN GUAM

Progress in governmental matters was marked by the appointment of a civilian Chief Justice of Guam to preside over the Court of Appeals and the Superior Court, by the vesting of certain legislative powers in the Guam Congress, and by the greater participation of Guamanians in government. Early in 1947, a study of conditions on Guam was made by a civilian committee appointed by the Secretary of the Navy of which Dr. Ernest M. Hopkins was chairman and Governor Maurice J. Tobin and Dean Knowles A. Ryerson were members. The committee report based on extensive hearings and inspections on Guam contained recommendations for United States citizenship and an Organic Act for Guam. The Secretary of the Navy on May 28, 1947, in a joint statement with the Secretary of the Interior before a Congressional committee, concurred in these recommendations of the civilian committee. At the end of 1947, 11 bills were pending before the United States Congress to provide an Organic Act for Guam or to confer United States citizenship upon the people of that island.

On Sept. 6, 1947, the Guam Congress passed a resolution expressing confidence in the Naval government of Guam and expressing the desire that the Navy Department continue to have administrative responsibility for Guam until the rehabilitation of the island should be completed and the economy fully restored. As of Nov. 1, 1947, a total of 2,923 claims for personal injury, death, and property damage as a consequence of the war and for use of land by the Government were paid in a total amount of $4,404,611.86. Such claims are being processed by the Guam Land and Claims Commission appointed pursuant to Public Law 224 of the 79th Congress.

AMERICAN SAMOA—DESCRIPTIVE

American Samoa, situated in the mid-Pacific just below the equator and 4,150 miles southwest of San Francisco, includes the island of Tutuila on which the U. S. Naval Station is located; the Manua group consisting of the islands of Tau, Olosega, Annuu, and Ofu; Rose Island; and Swains Island. These islands, with the exception of Swains, were acquired by the United States Dec. 2, 1899 by treaty with Great Britain and Germany. Swains Island was annexed to American Samoa by joint resolution of Congress, approved March 4, 1925.

The islands of American Samoa, with the exception of Rose Island which is an uninhabited coral atoll, are of volcanic formation and mountainous, rising in places abruptly from the sea. The total area of the group is 76 square miles. Pago Pago Bay, one of the safest and best harbors of the South Seas, nearly cuts the island of Tutuila in half.

The climate of the islands is tropical but equable. From May to November strong southeast winds are experienced, and during the other months the winds are variable. Moderate gales and occasional hurricanes have been recorded. The average yearly rainfall for 41 years has been 193.5 inches. The yearly temperature ranges from 70° to 90° Fahrenheit.

The soil of the islands is of two kinds, clay and sand. In the valleys, it is alluvial and quite fertile for growing tropical fruits and taro. Owing to heavy rainfall, the soil on hillsides is thin, and there is no subsoil.

THE SAMOAN PEOPLE

The indigenes of American Samoa are Polynesian and closely akin to the indigenous people of Hawaii and to the Maoris of New Zealand. The Samoan language is probably the oldest form of Polynesian speech extant. The population of American Samoa, as of July 1, 1947, was 17,550, mainly Polynesian, an increase of more than 25 per cent over the last pre-war population figure reported.

GOVERNMENT

American Samoa, classified as a possession of the United States, is under the control of the Navy Department and is administered by a Naval governor. The inhabitants, citizens of American Samoa, are nationals but not citizens of the United States. While the Constitution of the United States does not extend to American Samoa, the Codification of the Regulations and Orders for the government of American Samoa, printed in both English and Samoan languages, contains most of the guarantees of the Bill of Rights.

For purposes of local administration, American Samoa is divided into three districts, each having a Samoan governor and maintaining village, county, and district councils composed of hereditary chiefs and their advisors. The chief Samoan council, or Fono, meets annually and serves in an advisory capacity to the governor in matters relating to the welfare of American Samoa. The judicial power is vested in Village Courts each presided over by a village magistrate; six District Courts each presided over by a Samoan District Judge and a civilian judge from the United States; and a High Court presided over by a U. S. civilian Chief Justice and two Samoan Associate Justices selected from the District Judges. Capt. Vernon Huber, USN, the present Governor of Samoa and Commandant of the Naval Station, Tutuila, assumed office April 21, 1947.

EDUCATION

For the year ended June 30, 1947, instruction was offered in 46 public and seven private schools having a total enrollment of 4,055 and employing 108 Samoan and 16 non-Samoan teachers with professional training, as well as two Samoan principals. The Department of Education is headed by a naval reserve officer who in civilian life was a professional educator with a Ph.D. degree. The curriculum of the public schools is based on studies and recommendations made by members of the faculty of the University of Hawaii and by other educators experienced in the problems of Polynesian education. Attendance is compulsory for children between the ages of 7 and 15. The Government Experimental Farm is the most important phase of adult education.

ECONOMY

The natural resources of American Samoa are of no economic importance. There are no minerals, timber, or fish of sufficient quantity to justify industrial development for export. Copra (dried coconut meat), the most important crop for commercial sale, produced a gross income of $133,307.44 for the period July 1, 1946-July 1, 1947. The flourishing business in Samoan handicraft, which was developed during the war, has been continued under the direction of the Department of Samoan Industry, a government cooperative. Income from this source, principally from the sale of Laufala floor mats and curios, in fiscal 1947 amounted to $58,196.37. For the year ended June 30, 1947, the Bank of Samoa reported resources of $1,786,963.57.

MEDICAL CARE AND HEALTH

The new Samoan Hospital established in 1946 has a capacity of 200 beds and a staff of 12 Navy medical, dental, and hospital corps officers, nine Navy nurses and 32 Navy corpsmen, as well as three Samoan medical practitioners and 38 Samoan nurses. Included in the facilities of the new hospital are an insane asylum and a leprosarium. The hospital consists of eight modern well lighted and well ventilated wards, modern operating rooms, laboratory treatment room, and dental clinic. A motorized Child Health Clinic, recently established, visits villages distant from the hospital.

LEGISLATION

Early in 1947 a civilian committee, appointed by the Secretary of the Navy, of which Dr. Ernest M. Hopkins was chairman and Governor Maurice J. Tobin and Dean Knowles A. Ryerson were members, made a study of conditions on American Samoa. In the committee's report, based on extensive hearings and investigation on the island, it was recommended that an Organic Act be provided for American Samoa and that United States citizenship be conferred upon the indigenous inhabitants thereof. The Navy Department has expressed concurrence in these recommendations of the civilian committee, and, jointly with the Department of Interior, has prepared suggested legislation to accomplish that end.

At the end of 1947 four bills had been introduced in the Congress of the United States for providing citizenship and an Organic Act for American Samoa. On Oct. 23, 1947 the General Assembly of the chiefs of American Samoa requested the continuation of the U. S. Navy as administering agency of a naval civil government and also requested a bicameral legislature for the island. The Annual Fono of American Samoa meeting in November endorsed the recommendations made by the General Assembly.

TRUST TERRITORY OF THE PACIFIC ISLANDS

By William E. Neely
Lieutenant USN; Office of the Chief of Naval Operations, Navy Department

COMPOSITION OF THE TERRITORY

The Trust Territory of the Pacific Islands, consisting of those islands formerly mandated to Japan by the League of Nations, was granted to the United States in trust in 1947. The Trust Territory includes the Marshalls, the Carolines, and the Marianas (except Guam), some 2,146 islands, islets, atolls, and reefs located in mid-Pacific just north of the equator and extending 1,200 miles north to south and 2,500 miles east to west. The total land area of the Trust Territory is 715 statute square miles and the total over-all area of land and water is 3,121,722 nautical square miles. This area is sometimes referred to generally as "Micronesia" (small islands).

HISTORY

In the period of discovery, beginning early in the 16th century, the islands now included in the Trust Territory were visited by Spanish, German, Dutch, Portuguese and English explorers. At an early date, Spain established a firm control over the Marianas Islands. In 1886, the conflicting claims of Spain and Germany to the Marshalls and Carolines were resolved through the mediation of Pope Leo XIII pursuant to which Spain gained title to the Carolines and Germany secured undisputed control of the Marshalls. Following the Spanish-American War, Spain in 1899 sold the Carolines and the Marianas (except Guam which had been ceded to the United States in 1898) to Germany for 25,000,000 pesetos. The German rule over these islands was terminated in 1914 when the Japanese, not long after entering the First World War on the side of the Allied Powers, took possession. At the end of that war, Japan received a Class C mandate from the League of Nations over these islands. Soon thereafter the mandate was almost completely closed to non-Japanese visitors, and, as is now known, fortification of strategic islands was begun. In 1935, Japan withdrew from the League of Nations but did not relinquish control of the mandated territory. During the Second World War these islands and the surrounding waters became the scene of decisive naval and military operations. The names of such remote ramparts as Kwajalein, Eniwetok, Truk, Ulithi, Pelelieu, Saipan, and Tinian became world-famous. Beginning early in 1944, the islands either were wrested from Japanese control or were isolated from further effective participation in the war.

GOVERNMENT

From the termination of Japanese control until July 18, 1947 the islands comprising what is now the Trust Territory were under military government administered by the United

States Navy. On that date, military government was ended by the President's approval of the trusteeship agreement between the United States and the Security Council of the United Nations for the Trust Territory of the Pacific Islands (former Japanese mandate). By that agreement, among other provisions, the Trust Territory was designated as a strategic area; the United States was granted authority to fortify the area, to apply to the territory such laws of the United States as might be deemed appropriate, and to exercise veto power over any proposal to alter, amend or terminate the trusteeship agreement. In return the United States, among other particulars, bound herself to act in accordance with the Charter of the United Nations, to foster the development of self-government or independence in accordance with the wishes of the people concerned, and to promote the economic, social, educational and political welfare of the indigenous people. The President, also on July 18, 1947, by Executive Order 9875, delegated to the Secretary of the Navy the responsibility for the civil administration of the Trust Territory, on an interim basis and until such time as a civilian department or agency should be designated to have permanent supervision of the government of the area. Subsequently Admiral Louis E. Denfeld was commissioned as U. S. High Commissioner of the Trust Territory and Rear Admiral Carleton H. Wright appointed Deputy High Commissioner.

For reasons of logistics and communications the present seat of government for the Trust Territory is at Guam. The Trust Territory for purposes of administration has been divided into the following districts: Palau, Yap, Truk, Ponape, Majuro, Kwajalein, and Saipan. The government of the area is supervised by naval officers specially trained in island administration and by a small staff of civilian specialists in such fields as education, political science, economics, and agriculture. In so far as possible, consistent with the fundamental principles of democracy, the indigenous people of the islands have been encouraged to retain their traditional forms of government and to assume responsibility for conducting their own local affairs. Accordingly, local laws are enacted by village councils and enforced by local officials.

On each island having a significant population there is a court presided over by a local judge, having jurisdiction generally of misdemeanors and of civil cases involving not more than $100. Court decisions are reviewable by a representative of naval civil administration who periodically visits each island for the purpose of supervising and assisting the local people in the management of their government.

PEOPLE

The great majority of the indigenes of the Trust Territory are of the Micronesian race with a minority of Polynesians, who like the Micronesians, are of Asiatic origin. The natural loyalties in the islands of Micronesia at the present time are local rather than area-wide; there is similarity but not uniformity of local organization, social customs, and language throughout the whole of the area. The reported population for the Trust Territory, as of July 1, 1947, was 50,537. Population by districts is as follows: Palau, 6.014; Truk, 15,716; Yap, 4,546; Ponape, 8,914; Majuro, 3,610; Kwajalein, 6,766; Saipan, 5,550.

EDUCATION

In 1947, there were 122 public schools in the Trust Territory in which 270 teachers were employed and 8,943 pupils enrolled. Teacher training schools were conducted in each district with a total enrollment of 300 trainees. Instruction is offered in both English and the local language.

HEALTH

During 1947, a total of 73 dispensaries with a capacity of 337 beds were maintained in the Trust Territory for the use of the indigenous people.

More than 14,000 treatments were administered. Substantial progress in controlling yaws, tuberculosis, and internal parasites, the most prevalent ailments in the area, is reported. Schools for medical practitioners, dental practitioners, and nurses are maintained on Guam to which the best qualified candidates from the various islands are sent for training. A medical officer makes regular inspection trips to each island to administer treatments and to supervise the work of the local medical practitioner. Persons requiring hospitalization are transported to district headquarters or to Guam by ship.

PRODUCTION AND TRADE

The natural resources of the Trust Territory are meager, and for the most part the soil is unproductive. During the war, the economy of the islands was seriously disrupted. Coconut trees were devastated, and fish were driven from the lagoons by combat operations. Because of the remote location and distances involved in inter-island shipping, the problem of sea transportation is acute. An effort is being made to revitalize the island economy. Principal products for export are: copra (dried coconut), handicraft, trochus shells, and phosphate. Exports for 1947 were $500,000 (approximately) and imports $1,250,000 (approximately). From the time of the expulsion of the Japanese through 1947, trade in the islands was carried on mainly through the U. S. Commercial Company, an R. F. C. subsidiary. On Jan. 1, 1948, the U.S.C.C. was succeeded by the Island Trading Company of Micronesia, a Navy-sponsored public corporation, incorporated under the laws of Guam. It is the declared policy of the Island Trading Company to transfer trade operations to private enterprise as rapidly as the island people can assume this function.

ATOMIC DEVELOPMENTS

In 1946 the atomic bomb tests "Able" and "Baker" were conducted on Bikini Atoll in the Marshall group from which the 160 inhabitants had been removed to Rongerick atoll where they were resettled. On Dec. 2, 1947, the Atomic Energy Commission announced that Eniwetok atoll, also in the Marshalls, had been selected as a proving ground for routine experiments in atomic energy developments. Eniwetok was selected because of its isolation from other islands and because of the small number of island people involved (145). The inhabitants of Eniwetok have been resettled on Ujelang atoll.

SCIENTIFIC SURVEYS AND LEGISLATION

In November 1947, Yap atoll was swept by a typhoon which resulted in extensive property damage but no loss of life. Three scientific surveys were in progress in the Trust Territory at the end of 1947: of the people by the Coordinated Investigation of Micronesian Anthropology, a group of scientists from 21 different institutions in the United States and Hawaii; of the fishing resources of the area by the Fish and Wildlife Service of the Department of the Interior pursuant to Public Law 329 of the 80th Congress; and of the insect pests of the islands by the Insect Control Committee for Micronesia under the auspices of the Pacific Science Board of the National Research Council. Legislation to provide an Organic Act for the Trust Territory and to confer a local citizenship upon the indigenous people thereof is being prepared by the Department of State for submission to the Congress in 1948.

THE DISTRICT OF COLUMBIA

By W. Reed West
Professor, The George Washington University

TAXATION

Increase in salaries and contemplated engineering activities made necessary an increase in tax rates or the discovery of new sources of taxation for 1948. The District budget for 1948, therefore, calls for increased taxes (Public Law 195). The tax on real and tangible property has been increased from $1.75 to $2.00 per $100 of valuation. The gasoline tax is increased from three cents a gallon to four, and the annual motor vehicle inspection fee from 50 cents to $1.00. Water rents are increased by 25 per cent.

The House bill should have yielded a considerably increased return from the income tax. Exemptions of married couples were reduced from $2,500 to $2,000 although the credit for dependents was increased from $400 to $500. Of more importance was the definition of a "resident" as every person domiciled in the District of Columbia, or any person maintaining a place of abode there for seven months out of the year, except for elective Federal officers, and officers appointed by the President subject to Senate confirmation and whose tenure is subject to the pleasure of the President. Exception from double taxation was made for persons domiciled elsewhere. A large number of persons in the District are domiciled elsewhere and, therefore, in the past had claimed exemption from the income tax. The House bill would have collected an income tax from most of these. However, the Senate forced the House to recede. As the Act reads the tax on the Federal salary or income from without the District may be avoided by any Federal employee who declares himself to be domiciled outside the District.

On the other hand, an increase in District income has resulted from raising the Federal contribution for the support of the District Government. In 1947 the contribution was $6,000,000, 8.63 per cent of the total, the lowest percentage contribution made by the Federal Government to the District, at least in the last half century. Federal properties are exempt from District taxes and the District renders services to the Federal Government, such as the supplying of water. For 1948, the Federal contribution is raised to $12,000,000, of which $1,000,000 is to be credited to the water fund.

SCHOOLS

The salaries of teachers and administrators in the public schools were increased generally (Public Law 163). The range for teachers in the elementary schools, junior high schools, and senior high schools will be between $2,500 and $4,500. Recognition for the Master's degree in increased salary is now granted to the elementary teachers as well as to those on the high school level.

The Act of 1946, establishing nursery schools, was extended until June 30, 1948, with some minor changes (Public Law 123); and a change was made in the method of computing appropriations for the teachers retirement fund (Public Law 351).

There has been some criticism of the system of segregation between white and colored in the District school system. The President's Committee on Civil Rights made the charge that the Negro schools were inferior and pointed to overcrowding as compared with white schools. However, there is some evidence that the present situation is temporary and that attention to conditions in the Negro schools was, in fact, brought forth by the white school officials in an effort to obtain funds to remedy the situation. A proportion of Negroes are in old schools as a result of neighborhood changes in which white areas have become predominantly colored.

THE COURTS AND CORRECTION

The administration of parole was drastically changed. The old Board of Indeterminate Sentence and Parole was abolished and in its place was set up a board of three, one of whom is the Parole Executive, on a full-time basis. The other two serve without compensation. All are appointed by the Commissioners. The law is broadened to permit the Board to petition the court for a reduction in the minimum sentence where it is deemed advisable, and the jurisdiction of the Board also is extended to cover all sentences of more than 180 days (Public Law 198).

A recognition of alcoholism as a form of disease appears in an act (Public Law 347) establishing a clinic for the treatment of alcoholics. In criminal cases the Municipal Court is authorized to suspend proceedings and if it is found that the defendant is a chronic alcoholic, he is to be committed to the clinic for diagnosis. The director of the clinic may recommend that he be set at liberty conditionally, placed in a hospital or other agency for treatment, or returned to the court for trial on the original offense. There is provision also for the treatment of persons at their own request.

The power of the Juvenile Court to waive jurisdiction and permit trial in the regular courts in the past was limited to children of 16 or older. However, an atrocious crime occasionally is committed by a child below 16, and treatment of such a juvenile offender might not be complete before the age of 21, when he must be released. This defect in the law has now been corrected by permitting the Juvenile Court to waive jurisdiction in the case of any child charged with an offense which, if committed by an adult, would be punishable by death or life imprisonment (Public Law 53).

The act regulating the possession of dangerous weapons has been strengthened by permitting arrest without warrant, and search and seizure pursuant thereto, "as in the case of a felony," on probable cause, with the limitation that evidence discovered in such case shall not be admissible in a criminal proceeding unless the person arrested was carrying a dangerous weapon on or about his person (Public Law 344).

HOUSING AND INSURANCE

The licensing law in respect to public housing was improved by the grant of broader powers (Public Law 215). The old law had become obsolete in some respects, as, for instance, in reference to apartment houses containing single-room living units which were virtually unknown when the old law was enacted. The Emergency Rent Act was extended to March 31, 1948 (Public Law 309).

The insurance law was amended to correct a court decision affecting rights where the beneficiary predeceased the insured (Public Law 307).

UNDERTAKER LICENSING

Under the old law one could practice the business or profession of undertaker upon registering his name with the Health Department and without other proof of competence. A new licensing law lays down certain qualifications, including a high school education or its equivalent, graduation from a school of embalming in a course covering at least nine months, and two years of practical experience. In addition, the applicant must pass an examination (Public Law 308).

MISCELLANEOUS LEGISLATION

Corruption in connection with athletic contests was prohibited and made punishable (Public Law 179); the Commissioners were authorized to provide for daylight saving time for 1947 (Public Law 45); a minor change was made in the Unemployment Compensation Act (Public Law 252); compensation was provided for owners in condemnation proceedings that had been abandoned (Public Law

177); members of the police and fire departments who served in the armed forces were given certain seniority rights otherwise lost because of such service (Public Law 154); police, firemen and secret service men who served in the armed forces were given credit in connection with the policemen and firemen's relief fund (Public Law 205); and a number of minor acts were passed.

PROPOSED REORGANIZATION OF THE DISTRICT GOVERNMENT

Agitation for District suffrage has continued. A subcommittee of the House District Committee has completed a study of a proposed reorganization of the District Government with the thought of relieving Congress of some of its burden, creating a representative local government, and providing a more efficient government. Its report recommends a managerial form, with an elected council, but with the right of Congress to disapprove legislation or remove officials by concurrent resolution. The proposal has met with opposition in some quarters and apathy in others.

GOVERNMENTAL FUNCTIONS

DIVISION VII

PUBLIC FINANCE AND TAXATION

NATIONAL FINANCE AND THE PUBLIC DEBT

By William J. Carson
Associate Professor, University of Pennsylvania

GENERAL

National finance in fiscal and calendar 1947 continued to be dominated by the war and its aftermath. Approximately 85 per cent of Federal expenditures in fiscal 1947 directly reflected the costs of the war, the effects of the war, and efforts to prevent a future war: national defense, international affairs, veterans' benefits, interest on the public debt, and tax refunds. In fiscal 1948, it is estimated that the expenditures for these costs will approximate 80 per cent of total outlays. In his budget message to the Congress in January 1948, President Truman said the costs of these items would continue to bulk large in fiscal 1949, July 1, 1948-June 30, 1949, and would amount to 79 per cent of total expenditures in that year. On the basis of these developments the magnitude and composition of the Federal budget in the post-war years become still clearer. President Truman, in his budget message, noted that such a large proportion of expenditures in post-war years going to the costs of war "should be a sobering thought to all of us as we strive for the creation of lasting peace among the nations of the world."

Expenditures in fiscal 1947 declined still further from the levels of the war years to a total of $42,505,000,000. In fiscal 1948, they are estimated at $37,728,000,000. In fiscal 1946, they were $63,714,000,000 and in fiscal 1945 they were $100,398,000,000, the wartime peak. Receipts from taxation and other sources in fiscal 1947 were $43,259,000,000; in fiscal 1948, they are estimated at $45,210,000,000. The further reduction in expenditures in fiscal 1947 and the continuation of receipts from taxation at wartime levels resulted in a balanced Federal budget, with a small excess of receipts, for the first time since 1930. In fiscal 1948, it is estimated that receipts will be $7,482,000,000 larger than expenditures and make possible a substantial reduction in the Federal debt.

On June 30, 1947 the Federal debt was $258,286,000,000. This was a reduction of about $21,000,000,000 from the peak of $279,214,000,000 reached in February 1946. From July to December 1947, the debt was reduced still further to $256,900,000,000 on Dec. 31. Budget surpluses, estimated at $7,482,000,000 in fiscal 1948, will make possible still further reduction by June 30, 1948.

FEDERAL EXPENDITURES, FISCAL 1948

Total estimated expenditures for fiscal 1948 of $37,728,000,000 are approximately $4,777,000,000 smaller

TABLE I

FEDERAL EXPENDITURES

(millions of dollars)

Description	Actual Fiscal 1947	Estimated Fiscal 1948
National defense	14,280	10,746
Veterans' services and benefits	7,370	6,632
International affairs and finance	6,540	5,533
Social welfare, health, and security	1,379	1,960
Housing and community facilities	403	113
Education and general research	76	77
Agriculture and agricultural resources	1,248	614
Natural resources not primarily agricultural	628	1,179
Transportation and communication	587	1,563
Finance, commerce, and industry	237	372
Labor	120	97
General government	1,318	1,473
Interest on public debt	4,958	5,200
Refunds of receipts	2,897	2,049
Reserves for contingencies	—	120
Adjustment to daily Treasury statement basis	+464	—
Total Budget expenditures	42,505	37,728

than expenditures in fiscal 1947. The principal purposes for which expenditures of $37,728,000,000 in fiscal 1948 will be required and the amounts for the corresponding purposes in fiscal 1947 as reported by President Truman in his budget message are given in Table I.

Examination of the expenditures shows that the largest single items are:

TABLE II

MAJOR ITEMS OF EXPENDITURES, FISCAL 1948

(millions of dollars)

National defense	10,746
Veterans' services and benefits	6,632
International affairs and finance	5,533
Interest on public debt	5,200
Refunds of receipts	2,049
Total	30,160
Other activities	7,568
Total Budget expenditures	37,728

The item $10,746,000,000 for national defense includes outlays for Air, Army, Navy, and supporting defenses. Since the close of hostilities, expenditures for the armed services have been sharply reduced from the peak total of $84,530,000,000 in fiscal 1945. Nevertheless, national defense remains the largest single government program, constituting over 28 per cent of total budget expenditures. The enactment of the National Security Act of 1947 makes possible an integrated and balanced national defense program, and it is possible that some reductions in outlays for defense may result therefrom. The amount of these economies, however, has not thus far been determined. In his budget message, President Truman noted that the item of $11,025,000,000 for fiscal 1949 provides only for the minimum requirements of the National Military Establishment. "One basic element of a balanced national security program—universal training —," he said, "is still lacking."

The figure of $6,632,000,000 for veterans' services and benefits is to provide education and training, unemployment allowances, pensions, insurance, hospitals, and other services. This amount is $638,000,000 smaller than in fiscal 1947. In explanation of these outlays and their importance in the Federal budget, President Truman noted in his budget message that "during the past year about 900,000 World War II servicemen were returned to civilian life, increasing the number of World War II veterans to

14.7 million and the total veteran population to 18.6 million. Within a decade, veterans and their immediate dependents will constitute more than two-fifths of our entire population. Many of our veterans have rights under more than one provision of Federal law, and, although the readjustment program has now passed its peak, veterans' benefits will remain a large part of the Federal Budget for many years to come."

The item of $5,533,000,000 for international affairs and finances in fiscal 1948 includes outlays for reconstruction and stabilization, foreign relief, Philippine war damage and rehabilitation, membership in international organizations, and foreign relations programs of the Department of State. In 1947, expenditures for these purposes were $6,540,000,000. Smaller outlays in fiscal 1948 than in fiscal 1947 are due mainly to the fact that subscriptions to the International Bank and Fund were paid in fiscal 1947 and to sharply curtailed payments for foreign relief through UNRRA. Expenditures for the European recovery program, aid to Greece and Turkey, relief by the Army in occupied countries will be materially larger in fiscal 1948 than in fiscal 1947. These sums indicate in part the economic magnitude of the programs that have resulted because of the position in international affairs in which the United States finds itself as a consequence of the war.

Interest on the public debt is approximately $5,200,000,000. It represents a fixed obligation of the Federal Government, subject to change only as securities are retired or refunded and as interest rates are changed.

Refunds of receipts are expected to total $2,049,000,000 in fiscal 1948. The principal items included are corporate profits tax refunds and individual tax refunds. These are fixed obligations under present tax laws. In fiscal 1947, tax refunds were $2,897,000,000.

The remaining figure of $7,568,000,000 is to cover the outlays for social welfare, health and security, housing and community facilities, education and general research, agriculture and agricultural resources, natural resources not primarily agricultural, transportation and communication, services to finance, business, and labor, and general government functions and operations, and others. The total of these costs is approximately the same in fiscal 1948 as in fiscal 1947. Outlays for social welfare, health, and security, natural resources not primarily agricultural, transportation and communication, services to finance, commerce and industry, and for general government are larger in fiscal 1948 than in fiscal 1947, while those for the other items, particularly housing and community facilities, agriculture and agricultural resources, and services to labor, are smaller.

REVENUE AND TAXATION

Receipts from taxation and other sources during fiscal 1947 totaled $43,259,000,000. In fiscal 1948, they are estimated to increase to $45,210,000,000. Direct taxes on individuals are estimated at $22,793,000,000 in fiscal 1948, direct taxes on corporations at $9,548,000,000, and excise taxes at $7,320,000,000. The estimates for the current year, fiscal 1948, assume continuation of the present high levels of business activity and incomes, continued full employment, and stable prices close to the present level.

In his budget message, President Truman noted that receipts in fiscal 1949 "will decline from 1948 because of an estimated reduction of 2 billion dollars in miscellaneous receipts, most of which is due to a decline in receipts from sales of surplus property." Between fiscal 1947 and fiscal 1948, he said "revenues from corporations and individual income taxes combined increased by 5.5 billion dollars, more than offsetting the decline of 3.2 billion dollars in excess profits tax revenues. Between 1948 and 1949, revenues from the two types of income taxes will increase by an added 1.3 billion dollars. These increases are largely the result of inflation during the past 18 months, which has swelled corporation profits and ag-

TABLE III

FEDERAL RECEIPTS

(millions of dollars)

Description	Actual Fiscal 1947	Estimated Fiscal 1948
Direct taxes on individuals	20,408	22,793
Direct taxes on corporations	9,676	9,548
Excise taxes	7,270	7,320
Employment taxes	2,039	2,409
Customs	494	374
Miscellaneous receipts	4,831	4,373
Deduct: Appropriation to Federal old-age and survivors' insurance trust fund	1,459	1,627
Total Budget receipts	43,259	45,210

gregate personal incomes. Because the increase in tax collections lags behind the rise in profits and incomes, the 1948 increase in tax collections will be followed by a further rise in 1949."

Excise tax and employment tax receipts are estimated to be larger in fiscal 1948 than in fiscal 1947 as a result of continued high levels of production and income. Receipts from customs, however, are expected to be smaller in 1948 than in 1947. The international trade agreements which recently became effective may cause a further slight drop in 1949. The details of receipts and revenues are given in Table III.

SIZE AND DISTRIBUTION OF THE PUBLIC DEBT

At the end of February 1946, the Federal public debt was $279,214,000,000, the peak for the war period. By June 30, 1947, the total had declined to $258,286,000,000 and by Dec. 31, 1947, it had declined still further to a total of $256,900,000,000. The reduction from February 1946 to June 1947 was due mainly to the policy of the Treasury to use the large cash balance which had been built up in the closing months of calendar 1945 to retire the debt. The further reduction in July-December 1947 reflected the use of budget surplus to retire the debt. An estimated budget surplus of over $7,000,000,000 in fiscal 1948 will make possible still further reduction by June 30, 1948. Commenting on this policy of reduction in public debt, President Truman in his budget message said that "as long as employment and income continue at record levels—and especially while inflationary dangers threaten—we must make the most of our opportunity for debt retirement."

Table IV shows in detail the volume of the Federal debt on Feb. 28, 1946 when the peak was reached, on June 30, 1947 and on Dec. 31, 1947, and the composition of the debt on these dates by type of security.

Examination of Table IV shows that the reductions since February 1946 have occurred entirely in the marketable public issues, particularly in the certificates of indebtedness, Treasury notes, and Treasury bonds. As these issues were reduced, U. S. savings bonds and special issues increased in amount. This change in the composition of the debt is reflected in the holdings of the debt by different types of investors and investing institutions which are shown in Table V.

Between June 30, 1946 and June 30, 1947, the largest reductions were in the holdings of commercial banks, Federal reserve banks, business corporations and associations. Holdings of individuals and other investors were generally larger in 1947 than in 1946. This shift in the holdings of the public debt from banks to other investors reflects the policy of the Treasury to manage the public debt so as to cur-

TABLE IV

UNITED STATES GOVERNMENT DEBT, VOLUME AND KIND OF SECURITIES

(In millions of dollars)

	February 28, 1946	June 30, 1947	December 31, 1947

Total gross direct debt	279,214	258,286	256,900

tail rather than encourage inflationary expansion.

In the "Review of the Month" in the *Federal Reserve Bulletin,* July 1947, the Board of Governors of the Federal Reserve System discuss the debt retirement program and the change in the ownership as follows:

"Growth in public debt brought about in the course of financing the war came to an end in February 1946 when gross debt stood at 279 billion dollars. Since then it has been reduced by 21 billion dollars to 258 billion on June 30, 1947. This change reflected a reduction in marketable debt of 31 billion dollars, offset in part by an increase of about 8 billion

TABLE V

OWNERSHIP OF UNITED STATES GOVERNMENT SECURITIES, DIRECT AND FULLY GUARANTEED

(In billions of dollars)

Holders of Securities	June 30, 1946	June 30, 1947
Banks

Total interest bearing securities	268,578	255,197

in special issues to trust funds and in international obligations. An increase in savings bonds outstanding was about offset by a reduction in savings notes, but total marketable public issues increased by nearly 2 billion dollars over the sixteen-month period, reflecting the issuance of armed forces leave bonds.

"The debt retirement program in 1946, which reduced the marketable debt by 23 billion dollars from the February peak, was financed almost entirely by drawing on balances accumulated in the Victory Loan Drive. Funds raised in the Drive had been drawn in a considerable part from nonbank investors, although banks purchased outstanding issues during and after the Drive. Not only did the Victory Loan bring in funds in excess of the announced goal but also the budget position became more favorable in the spring of 1946; thus the large amount of funds obtained in the Drive was not needed for current expenditures and could be applied to payment of maturing debt. Considered in retrospect, the combined Victory Loan Drive and the subsequent retirement program was essentially a transfer in debt holdings. Long term debt was first placed largely with nonbank investors and the funds were used subsequently in main part to retire short-term issues held by the banks. . . .

"Changes in the distribution of holdings of United States Government securities since the spring of 1946 were influenced primarily by the retirement program. Commercial banks showed the largest decline in holdings; they accounted for half of the retired issues and in addition sold substantial amounts of securities in the market. Federal reserve holdings showed a slight decline; open market purchases did not quite offset redemptions. Holdings of nonbank investors also declined; reductions under the retirement program were offset only in small part by market purchases."

GOVERNMENT BOND PRICES AND YIELDS

Rates at which short term Treasury bills were issued continued through June 1947 at the same levels as in 1946. Beginning in July, however, rates increased and were twice as high in the second half of the year as in January-June 1947. Rates on medium term issues (3-5 year Treasury taxable notes) were somewhat

TABLE VI

AVERAGE YIELDS ON SHORT TERM OBLIGATIONS OF THE UNITED STATES GOVERNMENT

(Per cent per annum)

	1946		1947	
	New Issues of Treasury Bills	3–5 Year Taxable Notes	New Issues of Treasury Bills	3–5 Year Taxable Notes
January	.375	1.06	.376	1.26
February	.375	.99	.376	1.26
March	.375	.96	.376	1.24
April	.375	1.10	.376	1.24
May	.375	1.16	.376	1.27
June	.375	1.15	.376	1.29

November	.376	1.28	.932	1.47
December	.375	1.30	.950	1.54
Average	.375	1.16	.604	1.32

higher in January-June 1947 than in 1946 and increased still more in the second half of the year. Yields on long term taxable bonds, due in 15 years or over, continued in 1947 at about the same level as in 1946, averaging for the year 1947, 2.25 per cent as compared with 2.19 per cent in 1946.

Prices of Government bonds declined during the year from a high of 104.61 in March to 101.59 in December. The average for the year was slightly lower than the average for 1946.

Higher yields in 1947 than 1946 brought about a better adjustment between short- and long-term rates. However, by refunding long-term securities into short-term securities, the increase in the average interest rate paid by the Government on the market debt was minimized.

Tables VI, VII, and VIII show in detail the course of yields and prices by months in 1946 and 1947.

SOUND DOMESTIC ECONOMY AND MEETING RESPONSIBILITIES IN INTERNATIONAL AFFAIRS THE DOMINANT PROBLEMS

The two major problems with which national finance was concerned in 1947 and will continue to be concerned in 1948 were summarized by President Truman in his budget message as the carrying out of the responsibilities of the international position in which the United States finds itself as a result of the war and maintaining a sound domestic economy. Since the end of the war inflationary expansion has been a dominant threat to the maintenance of a sound economy and continues to be a matter of major concern. In 1946 and 1947, no reduction in taxation, prompt debt retirement, and curtailment of Federal expenditures were recommended as steps to counteract inflationary expansion. In his 1948 budget message, the President again stresses these as essential steps to the maintenance of a sound domestic economy and to insure that the country's international responsibilities are carried out.

MUNICIPAL FINANCE

By H. K. Allen
Professor, University of Illinois

GENERAL

The highlights in Municipal finance for the year 1947 were a further increase in operating expenditures, continued low-level of tax delinquency, and marked increase in new bond issues. The increase in operating expenditures results from the higher cost of materials and supplies and salary increase. The increase in bond issues reflects the launching of postwar public works projects.

The most recent year for which the comprehensive statistics of the Bureau of the Census in final report form are available is for 1945.

While some of the absolute expenditures just noted may appear large, yet too great significance should not be attached to them. The size of an expenditure becomes intelligible in terms of service when one discovers the number among whom it is divided. The per capita expenditures of cities, both as a whole and for particular items have varied greatly from time to time, but the general tendency has been to increase. The latest year for which per capita figures are available is 1942. The following table shows the change in per capita expenditures for selected years:

MUNICIPAL EXPENDITURES

(000 omitted)

Operation and Maintenance, by Major Functions[1]

Year	Total	General Government	Public Safety	Health and Sanitation	Highways
1945	$1,964,048	$170,911	$484,687	$326,197	$153,417
1944	1,904,844	163,463	474,681	309,147	139,996

1903	278,173	30,842	71,020	25,807	34,208

---

[1] Statistics for 1944 and 1945 are for all cities having a population over 25,000; statistics for 1932 to 1942 are for cities having a population over 100,000. All other data are for cities over 30,000. Because of some changes in the basis of classification, the figures for 1938, 1940, 1942, 1944, and 1945 are not strictly comparable with those for earlier years. In 1944 and 1945, expenditures for hospitals were included with those for health and sanitation. Beginning in 1937, the financial statistics of public-service enterprises were reported separately from those of general government.

Year	Charities, Hospitals, and Corrections	Schools	Libraries	Recreation	Miscellaneous
1945	$201,399	$456,544	$32,073	$82,479	$ 56,341
1944	204,788	453,384	30,226	74,908	54,251
1942	345,841	377,123[1]	21,339	55,737	31,014

1903	13.19	1.46	3.35	1.21	1.64	.86	3.86	.10	.35	.27

* Payment for pensions are included in column "Miscellaneous" for the years 1911 to 1927 inclusive; for the years 1903 to 1909 inclusive, they are included with expenses for police, fire, and school departments.

** Payments for expenses of art galleries and museums are included in column "Recreation" for the years 1911 to 1927 inclusive; for the years 1903 to 1909 inclusive, they are included with the expenses of libraries; expenditures for libraries and schools are combined for the years 1932 and 1934.

IMPORTANCE OF DIFFERENT MUNICIPAL EXPENDITURES

There is a wide difference in the importance attached to the different functions performed by municipalities. While over a period of years there has been some change in the relative importance of some of the items, it is interesting to note that expenditures for education, except for the last two years, were always larger than any other, and that the relative importance of this item up to 1932 tended to increase with the years. The most significant development in recent years, it will be noted, is the increase in expenditures for public safety. The following table shows the relative importance of the different services over a period of years:

PERCENTAGE OF EXPENDITURES FOR DIFFERENT FUNCTIONS

Year	General Government	Public Safety	Health and Sanitation*	Highways	Charities, Hospitals, and Corrections*	EDUCATION		Recreation	Miscellaneous
						Schools*	Libraries*		
1945	8.7	24.7	16.6	7.8	10.3	23.2	1.6	4.2	2.9
1944	8.6	25.0	16.2	7.3	10.8	23.8	1.6	3.9	2.8

* Expenditures for hospitals are included with those for health and sanitation in 1944 and 1945. Percentages for schools and libraries combined for the years 1932 to 1935.

SOURCES OF REVENUE

Property Taxes.—The revenue of cities arises from a number of sources. In most cities more than 90 per cent of the funds which go into the general revenue fund come from the general property tax. This is a tax levied against real and personal property. In addition to the general property tax, the Census Bureau designates certain taxes as special property taxes. Such include taxes upon the capital stock of corporations, upon savings banks and other financial institutions, and upon insurance companies. Included in this, also would be taxes levied upon mortgages at time of recording, taxes upon incomes and estates, upon investments, and a wide range of specific taxes.

Poll and Business Taxes.—In many cities, also, some form of poll tax continues to be used, although such taxes are much less important than formerly. No generalization can be made as to method of levy since this varies greatly from city to city. In addition, business and non-business license taxes make up a large group of levies upon different types of business activities, some of which, of course, are levied primarily for regulative purposes. The latter include such levies as those upon dogs, dance halls, etc. Receipts from special assessments constitute an important item, but they do not enter the general revenue fund. In some places at a particular time, subventions and grants are an important source of income, while in some cities, also, the earnings from public enterprises are not unimportant. The relative importance of major sources of revenue over a period of years is shown in the following table:

VII. PUBLIC FINANCE AND TAXATION

PERCENTAGE OF RECEIPTS FROM DIFFERENT SOURCES OF REVENUE

Year	The General Property Tax	Other Taxes and Licenses	Special Assessments	Subventions, and Grants, Donations and Pension Assessments	Earnings of Public Service Enterprises[2]	Other Revenues
1945[1]	63.1	9.5	0.9	17.9	....	8.6
1944[1]	64.8	9.2	1.1	18.9	....	6.0

1903	61.4	9.8	7.6	4.3	11.5	5.5

[1] For all cities having populations over 25,000. Statistics for 1932 to 1940 are for cities having a population over 100,000. For years prior to 1932, data are for cities over 30,000.

[2] Listed separately in years 1937 to 1945.

PER CAPITA TAX BURDEN

That the tax burden imposed by cities has been increasing much more rapidly than population is readily seen when one notes the change in the per capita amounts collected from different sources over a period of years. The latest year for which per capita figures are available is 1942.

PER CAPITA RECEIPTS FROM DIFFERENT SOURCES

Year	Total	The General Property Tax	Other Taxes and Licenses	Special Assessments	Subventions and Grants, Donations and Pension Assessments	Earnings of Public Service Enterprises[2]	Other Revenues
1942[1]	$49.79	$32.45	$4.89	$....	$ 8.65	$....	$3.80

[1] For all cities having populations over 25,000. Statistics for 1932 to 1940 are for cities having a population over 100,000. For years prior to 1932, data are for cities over 30,000.

[2] Listed separately in years 1937 to 1942.

MUNICIPAL INDEBTEDNESS

Receipts from sources of revenue may either just pay expenses, more than pay expenses, or fail to pay them. In many cases, the administrators of the finances have planned for a surplus but because of a shrinkage in revenue have had to resort to borrowing.

In the calculations of the Census Bureau, municipal indebtedness is divided into two distinct groups, long-term obligations and short-term loans. The former includes all obligations which have a number of years to run and for the redemption of which no assets other than a sinking fund or earnings of public service enterprises have been specifically designated. The latter, on the other hand, includes such indebtedness as is evidenced by warrants, accounts payable, and other short-term obligations. The following table shows the net long-term indebtedness for certain years.

MUNICIPAL INDEBTEDNESS

(000 omitted)

Year	Net Long-Term Debt	
	Amount	Per Capita
1945[1]	$5,243,472	$.....[1]

[1] For all cities having population of more than 25,000. Statistics for years 1932 to 1940 are for cities having a population over 100,000. For years prior to 1932, data are for cities over 30,000. Per capita figures not available for 1944 and 1945.

DEVELOPMENTS IN THE BOND MARKET

The aggregate disposals of long-term obligations by states and municipalities for the first ten months of each year for a series of years are shown in the accompanying table. Total issues for the months covered increased from $919,280,000 in 1946 to $2,068,002 in 1947.

MUNICIPAL BOND ISSUES

(000 omitted)

Year	Total First Ten Months	Year	Total First Ten Months
1947	$2,068,002	1929	$1,055,135
1946	919,280	1928	1,094,074
1945	671,251	1927	1,297,029
1944	641,779	1926	1,149,105
1943	380,990	1925	1,174,724
1942	488,415	1924	1,280,504
1941	823,115	1923	850,952
1940	954,593	1922	990,188
1939	956,386	1921	868,392
1938	800,606	1920	570,109
1937	769,778	1919	581,871
1936	955,500	1918	245,789

FEDERAL EMERGENCY ADMINISTRATION OF PUBLIC WORKS

The table showing municipal bond issues does not include the extension grants made to municipalities for public-works projects by the Federal Emergency Administration of Public Works. This agency was created by the National Industrial Recovery Act which became effective June 16, 1933. Under Title II of this Act, authority was granted to the Administrator to furnish grants, not subject to repayment, for 30 per cent of the total expenditures incurred for the payment of labor and material costs on approved public-works projects. Moreover, the agency was authorized to accept 4 per cent general obligation or revenue bonds of the municipalities as security for the loan portion of the allotment. In 1934, Congress authorized the Reconstruction Finance Corporation to purchase marketable securities from the Public Works Administration and provided that moneys realized by the Public Works Administration from such sales might be used for making additional loans, but not grants, in aid of non-Federal public-works projects under Title II of the National Industrial Recovery Act.

In addition to the program of public works administered under Title II of the National Industrial Recovery Act, the Public Works Administration carried on a separate program pursuant to the Emergency Relief Appropriation Act of 1935. Under the latter act, the amount of the grant was fixed by Administrative determination at 45 per cent of the cost of the project, with a corresponding reduction in the amount to be furnished by the applicant. Provision was made under this act for the sale of bonds acquired as collateral for municipal loans either on the open market or to the Reconstruction Finance Corporation, the proceeds to be used only for the making of loans. In practice, the sales were confined to the Reconstruction Finance Corporation which, in turn, sold the securities on the open market.

TAX DELINQUENCY

Tax delinquency is a natural phenomenon of a business depression, and a rising trend of tax delinquency inevitably cripples municipal functions and weakens municipal credit. During periods of prosperity, on the other hand, tax delinquency drops sharply. Dun and Bradstreet has made a study of the trend of median year-end tax delinquency in 150 cities over 50,000 population for the 13-year period from 1930 to 1946. The following percentages show the median delinquency on the current tax levy at the end of each fiscal year:

1946......	3.20%	1937......	11.3%
1945......	3.30%	1936......	13.9%
1944......	3.90%	1935......	18.0%
1943......	4.70%	1934......	23.05%
1942......	6.00%	1933......	26.35%
1941......	6.80%	1932......	19.95%
1940......	8.70%	1931......	14.60%
1939......	9.25%	1930......	10.15%
1938......	10.7%		

These figures show a substantial gain in collections since 1933, and delinquency in 1946 was much lower than it was in 1930. Only fragmentary data are available for 1947, but it is believed that little change has occurred since 1946.

DEBT DEFAULTS

The *Bond Buyer* estimated, with certain reservations, that 116 cities and towns were in default on their bonds on Dec. 1, 1947. This represents a reduction from the previous year when 131 incorporated places were in default.

The following states, according to the *Bond Buyer,* had the largest number of defaults:

Florida.........	39	North Carolina..	9
Texas..........	15	Michigan.......	5
Pennsylvania...	9	Oklahoma.......	5
Colorado.......	9	Minnesota......	4

It is significant to note that Florida and North Carolina, which are included in the above group, had large increases in local indebtedness between 1912 and 1932, the percentages being 2,779.01 and 1,300.8, respectively. The indebtedness of Maine during the same period increased only 73.2 per cent, while that of Massachusetts increased only 99.2 per cent. Maine had one incorporated place in default in 1947, and Massachusetts had none.

While no data are available regarding the volume of municipal bonds in default, it can reasonably be stated that the volume of such defaults declined during 1947.

DEBT ADJUSTMENT LEGISLATION

For the purpose of aiding municipalities which are in default on their obligations, various states have recently passed state receivership and debt adjustment acts. Boards or commissions have been established to supervise local indebtedness in general, to supervise the refunding of municipal bonds, and to act as receivers in event of failure to meet debt service.

A Federal Municipal Bankruptcy Act was enacted May 24, 1934. This act, which was declared unconstitutional by the United States Supreme Court in May, 1936, was designed to enable any taxing district, with the consent of its creditors and the approval of a Federal District Court, to adjust its debt structure. According to the *Bond Buyer,* only 27 cities, one county, one school district, 41 irrigation districts, and one road district filed petitions under the Municipal Bankruptcy Act during the two years in which the law was in effect.

On Aug. 16, 1937, President Roosevelt signed a new Municipal Bankruptcy Act, designed to replace the original measure which was declared unconstitutional. The present law is similar in its provisions to the invalidated law. It provides a procedure whereby insolvent taxing agencies, such as local drainage, levee, irrigation, road, and sewer districts, as well as towns, boroughs, and municipalities, may effect compositions with their creditors. These compositions are approvable only when the districts or agencies file voluntary proceedings in bankruptcy accompanied by plans approved by 51 per cent of all the creditors of the district or town. The plan of composition can not be confirmed unless accepted in writing by creditors holding at least 66⅔ per cent of the aggregate amount of the indebtedness of the petitioning district or taxing agency, unless the judge is satisfied that the taxing district was authorized by law to carry out the plan and there had been a finding by the Court that the plan was fair, equitable, and for the best interests of the creditors. According to the *Bond Buyer,* 281 cases were filed under the 1937 Federal Municipal Bankruptcy Act prior to Dec. 1, 1947.

FEDERAL INCOME AND PROFITS TAXES

By Mark Carter Mills
Associate Professor, Indiana University

GENERAL

No changes in Federal income taxes were made in 1947. Two acts designed to reduce taxes on individual incomes were passed by the Congress; both were vetoed by President Truman. In each case the veto was sustained by a narrow margin. A long-range program of planning and research looking toward an eventual comprehensive revision of the Federal tax system was carried on by the Treasury. During the year there was much discussion of income tax revision both inside and outside Congress, and a number of tax programs were offered by different groups. The specific proposal most widely approved was that of permitting family incomes in all the states to be treated as they are now treated in the "community property" states.

Official discussion of tax revision began with the opening of Congress in January 1947. Chairman Knutson of the Ways and Means Committee promised an individual income tax cut of 20 per cent. President Truman, in his Budget Message of Jan. 3, 1947, announced that he was opposed to any income tax cuts in 1947. He said: "As long as business, employment, and national income remain high, we should maintain tax revenues at levels that will not only meet current expenditures but also leave a surplus for retirement of the public debt. There is no justification now for tax reduction."

To a considerable extent, the difference of opinion which characterized the discussion of tax revision throughout the year represented a clash of conflicting fiscal theories. Those holding what might be called an "incentive theory" were inclined to stress the necessity of reducing taxes in order to encourage saving and expanded production. In the main, this was the view of the majority party in Congress.

The contrasting or "purchasing power theory" held by the President and many of his advisors, was that a major function of government was to support consumer buying power. Such a theory of taxation logically leads to a policy designed to prevent too much saving by receivers of high individual incomes and to a reduction in rates on receivers of small incomes in order to equalize purchasing power. However, in view of the revenue needs of the Government and of disturbed world conditions, President Truman opposed any cuts in 1947.

TREASURY OBJECTIONS TO INCOME TAX REDUCTION

In appearing before the Ways and Means Committee of the House on March 13 and before the Senate Finance Committee on April 22, to present the views of the Treasury, Secretary Snyder opposed any income tax reduction in 1947, on three general grounds. In addition he offered certain specific and technical objections to the bill under consideration.

His first general objection was on the ground of general economic conditions. He did not believe that, in view of the existing business prosperity, tax reduction was either appropriate or necessary to secure continued high-level production. In addition, he believed that tax reduction in 1947 would intensify inflationary pressures.

Secretary Snyder's second objection concerned the budgetary situation. He argued that, in view of unforeseeable contingencies, it would be unwise to reduce revenues until expenditures were known. He further argued that tax rates should be maintained at a level sufficiently high to provide a budgetary surplus which could be used to reduce the national debt.

The Secretary's third general objection to tax reduction in 1947 was that a drastic reduction in revenue from individual income taxes might delay a comprehensive program of tax revision to come later. In this connection, he referred to the Treasury's long-range program of research looking toward an eventual comprehensive revision, not only of the individual income tax but of corporation, excise, estate, and gift taxes as well.

In specific criticism of H.R. 1, Secretary Snyder held that it was deficient from the standpoint of equity on the ground that it would reduce taxes on very high incomes proportionally much more than on lower and middle incomes. In addition to objecting to certain technical features, he stated that the bill, if passed, would complicate income tax administration and greatly increase its cost.

FEATURES OF THE INDIVIDUAL INCOME TAX REDUCTION ACT

The tax reduction bill (H.R. 1), as it emerged in final form, provided a general reduction of individual income tax rates and a special additional exemption for taxpayers over 65 years of age.

It was proposed that for taxpayers whose net income in excess of exemptions was $1,000 or less the tax payable should be reduced by 30 per cent and by an amount which under the "notch" provision would rapidly fall to 20 per cent at a net income of $1,396 after exemptions. For net income after exemptions between $1,396 and about $302,400 the reductions would have been 20 per cent. For higher incomes the reduction would have gradually tapered off to 10.5 per cent above $5,000,000. The bill proposed a special additional personal exemption of $500 for persons over 65 years of age.

The Tax Research Division of the Treasury estimated that, under the provisions of the bill, only about 1,100 taxpayers would have got less than a 20 per cent rate reduction. About 14,400,000 would have got a 20 per cent rate reduction. About 8,500,000 would have got between 20 and 30 per cent. The remaining 24,800,000 taxpayers at the bottom would have got 30 per cent rate reduction. Under the provision for a special additional exemption for persons over 65 years of age it was estimated that the additional exemption would have reduced the income tax of 2,800,000 persons over 65, of whom 825,000 would have become non-taxable.

On the basis of 1947 incomes, the Treasury estimated that the act would reduce Federal tax revenues by $3,769,000,000 for a full year. As finally voted by Congress, however, the reductions would have applied only to the second half of 1947, and 1948 would have been the first full year in which the reductions would have been effective.

PASSAGE AND VETO OF FIRST TAX REDUCTION ACT

After lengthy hearings and much discussion, the bill designated the Individual Income Tax Reduction Act of 1947 (H.R. 1) passed the House of Representatives on March 27 by a vote of 273 to 137. Forty Democrats voted with the Republican majority in favor of the bill and three Republicans and one member of the American Labor Party were included in the opposition. A similar bill passed the Senate on May 28 by a vote of 52 to 34. Seven Democrats joined 45 Republicans in favor of the bill and two Republicans voted with the 32 Democrats who opposed it.

The Conference Report went to vote in the House June 2 and was passed 220 to 99. The winning vote consisted of 183 Republicans and 37 Democrats, the opposition of 97 Democrats, one Republican, and one American Labor Party. The Senate acted the next day and passed the bill by a vote of 48 to 28, with 42 Republicans and six Democrats for the bill and two Republicans and 26 Democrats against it.

President Truman announced his veto of the tax reduction act June 16. In his veto message the President reiterated the stand against tax reduction taken in his budget message in January and characterized the act as providing the "wrong kind of tax reduction at the wrong time." Three principal points were made: (1) The country was still in a transition period in terms of national finances, and the situation called for "prudence and conservative management"; (2) the President stated that the economy was already subject to inflationary pressures, and tax reduction would tend to increase them; (3) if the integrity of the national debt is to be maintained, the debt must be reduced by substantial amounts.

The House of Representatives took final action on the vetoed bill the next day, June 17, and the veto was sustained. The roll call showed 268 voting to over-ride the veto with 137 voting to sustain it. Since a two-thirds vote was necessary to over-ride, the House action was final, and the bill was dead. Analysis of the vote on the veto showed that 35 Democrats had joined 233 Republicans in favor of over-riding while two Republicans and one member of the American Labor Party had voted with 134 Democrats to sustain the President's veto.

SECOND TAX REDUCTION ACT

The First Tax Reduction Act would have brought relief to all individual taxpayers effective July 1, 1947. The bill as reintroduced into the House to become the Second Tax Reduction Act was essentially the same except that the date of becoming effective was pushed forward to Jan. 1, 1948.

The second tax reduction bill passed the House on July 8 by a vote of 302 to 112. Two hundred and thirty-three Republicans and 69 Democrats voted for it, and 109 Democrats, two Republicans, and one member of the American Labor Party voted against it. The vote in the Senate came on July 14 and resulted in the passage of the bill by a vote of 60 to 32, with 48 Republicans and 12 Democrats voting for the bill and 30 Democrats and two Republicans voting against it.

President Truman's veto message was transmitted to Congress on July 18. In explaining his objections to the act the President said: "This is still the wrong kind of tax reduction and this is still the wrong time to provide for tax reduction." He repeated the objections which had led him to veto the first tax reduction act and more specifically stated: (1) That the act was not consistent with sound fiscal policy; (2) that if allowed to become law it would contribute to inflationary pressures; (3) that such an act would delay needed readjustments in prices; (4) that the act was unfair in that it would reduce taxes disproportionately more in high income brackets than in low.

Both the House and the Senate voted on the veto the same day the President's message was received. The House voted to over-ride 299 to 108, with 236 Republicans and 63 Democrats voting against the President and 105 Democrats, two Republicans, and one American Labor Party member voting to sustain the veto. In the Senate, however, the two-thirds vote necessary to over-ride the veto was lacking, the vote being 57 to 36, with 10 Democrats voting with 47 Republicans to over-ride the veto and three Republicans joining 33 Democrats to sustain.

CHAIRMAN KNUTSON'S NEW PROPOSAL

Chairman Knutson of the Ways and Means Committee introduced a new individual income tax reduction bill on Dec. 18, the day before adjournment of the special session called by President Truman to provide European emergency relief.

In many respects similar to the bills vetoed earlier, the new bill provided for raising the personal exemption from $500 to $600. It also called for a special additional exemption of $600 for persons over 65 years of age and for raising the present special exemption of blind persons from $500 to $600.

For persons with taxable incomes not exceeding $1,000 after exemptions, the reduction in rate would be 30 per cent. The reduction for those with taxable incomes between $1,000 and $1,396 would be on a sliding scale ranging from 30 to 20 per cent. On incomes between $1,396 and $4,000, the reduction would be 20 per cent. In the case of taxpayers with taxable incomes over $4,000 there would be a reduction of 20 per cent on the first $4,000 and a reduction of 10 per cent in the tax applicable to the remainder of their incomes. It was in respect to the reduction on incomes of over $4,000 that the bill differed most drastically from the earlier bills. In addition, the bill provided that the family income treatment now permitted in "community property" states be generalized to apply to all taxpayers.

Chairman Knutson proposed that his bill, if passed, should be made retroactive to Jan. 1, 1948 and estimated it would reduce Federal revenues by approximately $5,600,000,000.

It was not clear as the special session closed that Knutson's proposals would become the official Republican program when the new session opened in January. When asked to comment on the Knutson proposals in a press conference, President Truman reiterated his continued opposition to any income tax reduction in the near future.

PROPOSALS FOR COMPREHENSIVE TAX REVISION

Numerous proposals were made during the year regarding a comprehensive revision of the whole Federal tax system. Some of the proposals came from government officials and agencies and some from groups outside government circles. Among the non-governmental organizations offering plans were the National Association of Manufacturers and the Committee for Economic Development.

On May 19, the Treasury announced that the Tax Research Division had undertaken some 20 lines of investigation to provide the information needed for future legislation. Approximately half the studies undertaken by the Treasury were in the field of business taxation, the rest concerned with individual income taxes. Of those concerned with individual income taxation, the one arousing greatest popular interest was that of the treatment of family income, and on this the

Treasury issued a report on June 18.

The report made no policy recommendations but stressed the importance of the topic for early consideration by Congress. After reviewing the present situation under which married couples living in the so-called "community property" states are now permitted to divide their combined incomes equally between them in computing their income tax liability, regardless of the share actually earned by each spouse, the Treasury study pointed out: "Present law discriminates between families on the basis of residence, by enabling couples in community-property States to divide their earned investment community income between separate tax returns, thereby reducing their taxes through the double use of the lower rates of the progressive tax rate schedule. It discriminates also on the basis of the nature of income, by requiring earned income in noncommunity-property states to be taxed to the earner, but affording recipients of investment income numerous opportunities for splitting that income with members of their family. Finally, it discriminates between recipients of investment income by favoring families who avail themselves of opportunities to split income by gift and such devices as family trusts, corporations, and partnerships."

The study outlined possible lines of action and estimated that, if all families in the country were given the tax splitting privilege now enjoyed by those in the community property states, it would afford tax relief to some 5,000,000 families. For a family with taxable income of $5,000, the reduction would amount to 4.8 per cent. At $25,000, the maximum saving in taxes of 28.9 per cent would be reached. For couples with $1,000,000 of income the reduction would amount to 2.8 per cent. In general, if the proposal to permit income splitting were made nationwide, upper middle-class families with incomes from $10,000 to $100,000 would gain most.

In 1942, the Treasury proposed to remove the advantage enjoyed by the community property states by making joint returns mandatory for all couples. This recommendation was at that time voted down by Congress. So great was the popular interest in 1947 in generalizing the income splitting privilege that 22 bills proposing such a system were introduced during the first session of the 80th Congress.

The community property states prior to 1947 were: Arizona, California, Idaho, Louisiana, Nevada, New Mexico, Oklahoma, Texas, Washington, and the Territory of Hawaii. In 1947 Michigan, Nebraska, Oregon, and Pennsylvania were added to the list.

The tax program of the Committee for Economic Development was contained in a statement issued Nov. 13, 1947 and entitled Taxes and the Budget: A Program for Prosperity in a Free Economy.

After discussing long-range problems of budgetary policy and the objectives of a tax program to be considered when the post-war picture becomes clearer, the committee made five specific proposals for 1948. These recommendations were: 1. Reduce the present initial rate on individual incomes (now 19 per cent on the first $2,000 of taxable income) to 15.2 per cent on the first $1,000 and 16.8 per cent on the second $1,000. Continue progression of marginal rates to reach 67.3 per cent at $100,000 and a top rate of 82 per cent at $1 million; 2. extend to married couples in all states the privilege of dividing their incomes, deductions, and exemptions equally between them; 3. eliminate excise taxes on communications and transportation; 4. make a start toward elimination of the double-tax on dividends; 5. lengthen the period for which business losses may be carried forward and applied against future profits from the present two years to five years; reduce the carry-back period from two years to one year.

CORPORATION TAXES

Congress made no attempt to change corporation income taxes in 1947. Extensive hearings were held with a view to possible action in 1948. Most popular attention was focused on the problem of taxing the now partially exempt cooperatives.

Long-range Treasury studies were carried on in a wide field of business taxation. Among the topics considered were: the general problem of the corporate tax rate structure, the taxation of dividends in the hands of stockholders, business loss offsets, and the special problems relating to depreciation in periods of rapidly changing prices. Other studies dealt with the elimination of discrimination among various forms of doing business, the problems of small business, and of American business abroad. Attention was also given to intercorporate problems arising out of business integration.

IMPORTANCE OF INCOME AND PROFITS TAXES

Total net budgetary receipts of the United States Government for the fiscal year 1947 amounted to $43,259,000,000 as compared with $43,037,000,000 in 1946. Total expenditures in 1947 amounted to $42,505,000,000, a decline of one-third from the expenditures of $63,714,000,000 during the preceding fiscal year and a decline of nearly 60 per cent from the wartime peak of $100,397,000,000 reached in 1945. For the first time since 1930, the Government ended the fiscal year with a budgetary surplus. It amounted to $754,000,000.

The major importance of income and profits taxes is shown by the fact that income from these sources amounted to $29,020,000,000 as compared with $31,258,000,000 in the fiscal year 1946. The principal decline occurred in corporation tax receipts as a result of the dropping of the corporation excess profits tax in the Revenue Act of 1945. The yield of income and profits taxes over a ten-year period is shown in the following table:

INCOME AND PROFITS TAXES 1938-1947

(in thousands of dollars)

Fiscal Year	Total Income and Profits Taxes	Individual	Corporation Income and Excess Profits	Miscellaneous Profits Taxes
1938	2,629,030	1,286,312	1,299,932	42,786
1939	2,185,114	1,028,834	1,122,541	33,740
1940	2,129,609	982,017	1,120,582	27,010
1941	3,471,124	1,417,655	2,016,297	37,172
1942	8,006,884	3,262,800	4,687,462	56,621
1943	16,298,888	6,629,932	9,584,715	84,241
1944	33,027,802	18,261,005	14,629,344	137,452
1945	35,061,526	19,034,313	15,883,235	143,978
1946	31,258,138	18,704,536	12,462,437	91,165
1947	29,020,054	19,343,297	9,621,274	55,483

LAND AND PROPERTY TAXES

By Carol Loucks

New York State Department of Audit and Control

GENERAL

Various aspects of land and property taxation received considerable attention from the 45 state legislatures which met in regular or special session during 1947.

Arkansas became the twentieth state to abandon the ad valorem tax for state purposes (Act 110). However, the state will continue to collect the tax through 1948. The Utah Tax Study Commission recommended that the property tax in the State General Fund be eliminated except in times of emergency and that the general property tax be reserved for the support of schools and local government.

Massachusetts (Ch. 522) amended the General Law to require the entire amount of city, town, and district taxes to be paid on July 1 rather than in two installments. This law will be applicable to taxes levied in 1948 and thereafter. The Kansas Legislature (S.B. 65) imposed a levy on all property in the state to pay the principal and interest on soldiers' compensation bonds.

ASSESSMENT

Assessment, particularly local assessment, was an object of attention. Iowa (S.B. 46) created the office of county assessor within the office of county auditor and provided for the establishment of county boards of review. The Iowa State Tax Commission was authorized (H.B. 62) to supervise the activity of all assessors and boards of review in the state. All property subject to taxation is required (H.B. 70) to be valued at its actual value and to be assessed at 60 per cent of such value. The Nevada Compiled Laws, Section 6546, were amended (Ch. 179) to empower the tax commission to appoint a chief valuation consultant whose duties will be to review local assessments, develop a standard assessment procedure, carry on a training program for county assessors and supervise assessment procedures.

Arizona (Ch. 48) authorized the state tax commission to institute and contract for a scientific survey of all real property and improvements situated in any city, town, or other municipal corporation or legal subdivision of the state. Pennsylvania (Act 447) created a state tax equalization board whose duty it is to determine the market value of taxable real property in each school district and to equalize such values throughout the commonwealth for use in determining subsidies to school districts.

During the 1947 legislative session, Oklahoma revised its assessment procedure (Ch. 1A) to require annual assessments of all property. In order to assist the assessors, the Oklahoma Tax Commission was given additional duties. Hereafter the commission is to confer with and assist the assessors so that assessments may be made relative, just, uniform, and at fair cash value. The commission will prescribe forms, including property classification and appraisal forms, for the use of the assessors; it will render technical assistance through appraisal engineers; it will provide schedules of value of personal property; it will prepare an assessor's manual; and it will conduct training schools, institutes, conferences, and meetings for the improvement of the qualifications of local assessors.

TAX LIMITATION

The attention given tax limitation by the legislatures in 1947 was devoted almost exclusively to amending existing statutes for the purpose of increasing the rate limit. Kansas made several adjustments in the rates governing city levies. In cities of more than 90,000 population the tax levies were consolidated (H.B. 92) so that the limit for the general operating fund is ten mills and that for the special contribution fund is three mills. Unless specifically exempted by law, the limit includes all citywide levies.

The levy limit for cities of the second class was increased from nine to 12 mills for 1947 and 1948 and thereafter is to remain at nine mills (S.B. 20). In cities of less than 50,000 population, the permissible levy for parks and fire departments was increased (S.B. 96), while the levy limit for police, fire, health, sanitation and highways was increased for cities of more than 115,000 population (S.B. 316). Minnesota (Ch. 268) increased the limit of the tax rate for carrying on governmental functions in all towns from three to five mills. North Dakota increased the tax levy limitation for general city purposes to 21 mills (S.B. 90). An additional one half mill may be levied for each 1,000 of population in excess of 5,000, but the maximum general levy may not exceed 28 mills.

The county tax limitation was increased from 11 to 18 mills (H.B. 78); the town limitation was increased from five to ten mills (S.B. 98); and the village limitation was increased from ten to 15 mills. South Dakota (H.B. 200) amended its statutes to increase from six to seven mills the maximum tax levy in counties having an assessed valuation of more than $30,000,000 and less than $50,000,000. The Missouri Revised Statutes, Sec. 11046 were amended (H.B. 77) by repealing the provision limiting increases in tax levies to no more than ten per cent of the levy for the previous year.

The 1947 Ohio Legislature allocated all the proceeds of the cigarette license money to the localities and increased the state subsidies and sales tax moneys returned to the localities. These additional moneys were allocated in an attempt to assist the local units hard pressed by the stringent, over-all tax limit in that state.

EXEMPTIONS

Veterans exemptions again received consideration. Indiana increased the exemption granted war veterans with a service connected disability of ten per cent or more from $1,000 to $2,000 (Ch. 352). Florida (S.B. 590) exempted all homes, clubhouses, hospitals, housing projects and other property owned and operated by nonprofit organizations of ex-servicemen from ad valorem taxes in all Florida counties of more than 300,000 population.

Massachusetts amended the General Laws to make the tax exemption previously granted to veterans applicable only to real estate rather than property in general (Ch. 612). The requirement that a claimant for exemption have a service connected disability of 20 per cent was reduced to ten per cent. The General Laws also were amended (Ch. 647) to increase the property tax exemption of veterans of the Civil War, the Spanish War, the Philippine Insurrection and the Chinese Relief Expedition, who otherwise are not entitled to relief, from $1,000 to $2,000. The exemption was made applicable to estates not exceeding $8,000 rather than the former $5,000.

Iowa (H.B. 1) exempted personnel serving in the armed forces from interest and penalties on delinquent property taxes due in 1946-1947. This state also provided (H.B. 76) for the establishment of a military service credit fund and for reimbursement to the local taxing districts of taxes levied upon property subject to military service tax credit.

In the field of homestead exemptions, the unusual housing situation received some recognition. Minnesota (Ch. 537) permitted homestead exemptions to be allowed on property purchased as a homestead but which can not be occupied because of Federal or state regulation.

The Alabama Legislature acted favorably on a constitutional amendment which would replace from the proceeds of the income tax the revenue lost to the state because of homestead exemption. All homesteads in the state are declared by the act to be exempt from all state ad valorem taxes to the extent of at least $2,000. South Carolina exempted from taxation all household goods and furniture used in the home of the owner.

New Jersey (Ch. 374) authorized housing authorities to make payments in lieu of taxes to municipalities, counties, the state, or any political subdivision. Pennsylvania began the process of amending the Constitution (Joint Resolution Act No. 3) so that the general Assembly may, by general laws, authorize agreements between redevelopment authorities and local authorities limiting for a period not to exceed 25 years the amount of annual taxes to be levied upon land acquired for urban redevelopment.

Indiana established a state fair board (Ch. 214), provided that all property held by the board for fairs and exhibits shall be exempt from taxation, and authorized an annual levy of 3½ mills on each $100 of taxable property for the support of the board. Montana granted a property tax exemption to municipal airports (Ch. 288) and authorized reciprocal exemptions with other states. Nevada limited the exemption granted United States property to that not taxable by Federal laws (Ch. 200).

An international note was struck when New York (Ch. 24) exempted from taxation the real property of the United Nations used for establishing headquarters for offices and places of assembly.

LEVIES

Property tax levies were imposed to obtain the revenue necessary to accomplish several objectives of school authorities. Indiana empowered township trustees and school boards to levy a tax of not to exceed 75 cents on each $100 of taxable property within the school district (Ch. 248). The proceeds of the tax, which may be levied for 12 years, are to be placed in a special fund for the erection of new school buildings and the remodeling of old. In South Dakota, school districts were granted the power (H.B. 40) to levy a tax of no more than three mills on the dollar of assessed valuation to create a school building fund. Oklahoma (H.J.R. 10) proposed a constitutional amendment which would permit an additional county levy to be used to purchase sites and erect separate school buildings for white and Negro children.

The Idaho Code was amended to increase the minimum levy for common school districts from four to five mills (Ch. 257) and a like increase was provided (Ch. 262) for rural high schools. Kansas increased the limit of the levy for education in cities of more than 115,000 population from 20 to 26 mills (H.B. 223). The independent school districts of South Dakota were authorized to levy a tax of no more than 40 mills in cases where the previously allowed rate of 25 mills was not sufficient for the operation of schools. Indiana (Ch. 232) increased the maximum levy for school purposes, for the special school fund and for the supplementary tuition fund so that the maximum levy for each is now $2 on each $100 of taxable property.

Montana also increased (Ch. 273) the levy which the county commissioners may impose for the support of the common schools to not less than six nor more than eight mills on the assessed value of all taxable property. Montana also permitted the county commissioners to levy a tax of no more than one mill on the dollar of assessed valuation, the proceeds to be used for the purposes of adult education.

LEVIES FOR SPECIAL PURPOSES

During 1947, numerous levies for special purposes were permitted by state legislatures. Colorado enacted a series of bills (H.B. 591, 592, 593, 595, 596, 609, 611, 612, 616, 617, 621, 622, 623, 624, 628, 629, 637, 653, 655, 656, 657, 658, 659) which imposed millage rates on all real and personal taxable property in the state. The taxes will be in effect for ten years and the proceeds will be used for the construction of state buildings. Iowa authorized (H.B. 35) a 20-year levy at the rate of one and one quarter to one and one half mills annually for the purpose of building or remodeling city or town halls. Iowa also permitted counties to levy an annual tax for the maintenance of structures built on lands under the jurisdiction of the county for purposes of flood or soil erosion control. Idaho increased (Ch. 155) the levy permitted for the support of junior colleges and repealed the law which permitted the levying by highway districts of a special tax for truck highways (S.B. 48).

Tax levies for the support of libraries increased during the year. Iowa established (S.B. 201) free public libraries for the use of rural inhabitants of counties; cities and towns in the county library districts created pursuant to this law are included in the tax levy. Kansas (H.B. 201 and 234, S.B. 245) permitted cities of the various classes to levy taxes for the support of public libraries. Tennessee also granted the power to levy county-wide taxes for the support of libraries (Ch. 148), but the proceeds must be divided with city libraries.

MISCELLANEOUS SPECIAL LEVIES

Other special levies were enacted for a variety of purposes. Indiana permitted county hospital authorities to levy a tax for building purposes (Ch. 362) and provided (Ch. 271) for the establishment of full-time county and multiple county health departments able to levy a one mill tax in excess of established tax limits. In counties of more than 150,000 population with an area of 5,000 square miles, Minnesota (Ch. 4) allowed a four-mill levy for tuberculosis hospitals. Colorado authorized a levy to establish and maintain county health departments (S.B. 83) and increased the maximum rate of cemetery districts (H.B. 146) to one and a half mills. Kansas granted townships the power to levy a tax for the maintenance of cemeteries (H.B. 31). Indiana county boards of commissioners may establish county park and recreation programs (Ch. 296) and levy a tax of no more than ten cents per $100 of taxable property for their support. Cities and towns in Iowa now may levy a tax (H.B. 102) for the maintenance and employment of a symphony orchestra.

COMMUNITY PROPERTY TAXES

Nebraska and Pennsylvania became the twelfth and thirteenth states to enact community property tax laws. The Nebraska Legislature (L.B. 410) passed a community property tax law which defines community property as property acquired by either husband or wife during marriage and after Sept. 7, 1947. Separate property, real or personal, of either husband or wife is excluded if it was owned or claimed before marriage or before the effective date of the act. Each is vested with an undivided half interest in the property. The husband and wife shall each be entitled to exemption under the existing laws. Unless otherwise proven, all debts contracted by husband or wife after marriage or after Sept. 7, 1947 shall be regarded as community debts. Only such community property where title exists shall be liable for debt.

Pennsylvania enacted a community property law which provided (Act 550) that all property acquired by husband or wife during marriage and after Sept. 1, 1947, except property acquired by gift, devise, descent, or as compensation for personal injuries, shall be the community property of husband or wife. Each was vested with an undivided half interest therein. As Pennsylvania levies no income tax and the Philadelphia income tax is on a different base, the object of the law was to assist Pennsylvania taxpayers with Federal income taxes.

The Bureau of Internal Revenue, to date, has approved all the state community property tax laws. The courts have not been quite so favorable. The Pennsylvania Supreme Court, in *Willcox v. The Penn Mutual Life Insurance Company,* declared the community property tax law unconstitutional on the grounds that, by making community property out of income from separate property, the law violated that portion of the Declaration of Rights of the Pennsylvania Constitution which relates to deprivation of property without due process of law. The court further stated that the law was so vague and inconsistent that it could not be enforced judicially.

CORPORATION AND BANK TAXES

By William A. Sharkey
New York State Department of Taxation and Finance

FEDERAL TAXATION

Despite the extensive efforts of many groups, no Federal legislation of general applicability was enacted with respect to corporations during 1947. There was considerable discussion in legislative committees, and several important studies were conducted by Federal agencies regarding both single-case revision of statutes and an overall revision of Federal corporate taxation. Occupying a position of prominence in most discussions was the issue of double taxation of corporate distributions. Most of the recommendations were made preparatory to the 1948 Congressional session. Actual developments in the Federal area were limited largely to administrative rulings and judicial opinion.

STATE CORPORATION TAXES

State activity in the corporate tax field showed considerably more activity in 1947 than in recent years. A number of the states have readjusted their corporate tax structures, with several upwardly revising rate schedules. A considerable revision of administrative machinery was effected, as well as complete rewriting of old statutes and the introduction of corporate taxes for the first time in certain jurisdictions.

ARIZONA

Among the new impositions is Arizona's gross receipts tax on utilities at the rate of 0.1 per cent up to $250,000 and 0.2 per cent above that amount of gross operating revenue. Receipts are earmarked to meet the administrative costs of utility regulation.

ARKANSAS

Subsequent to the *West Publishing Company* decision, Arkansas introduced a complementary corporation income tax similar to that of California, by which it subjects to taxation foreign corporations engaged in interstate commerce. The statute also provides for a 50 per cent ceiling on deductible Federal income taxes.

CALIFORNIA

Bank and corporation franchise taxpayers were granted a 15 per cent credit on tax based on years beginning before Jan. 1, 1949, and a like credit for corporation income taxpayers relative to years beginning before Jan. 1, 1948. The credit does not affect the minimum tax provision of $25.

COLORADO AND CONNECTICUT

In line with a revision of the state income tax law, Colorado corporations are now taxable at the rate of 5 per cent.

The general corporation income tax rate in Connecticut was increased from 2 per cent to 3 per cent with the provision that the 3 per cent rate be applicable to certain telephone companies. The alternative business corporation millage tax was increased from 1 to 1½ mills per $1 of assets, and the minimum tax increased from $10 to $15.

MARYLAND

A significant increase in the corporation net income tax occurred for tax years beginning Jan. 1, 1948, with a rate rise from 1½ per cent to 4 per cent. Deductions for contributions by corporations are now limited to 5 per cent of net income, rather than the 15 per cent formerly allowed.

MASSACHUSETTS AND MISSOURI

The corporation excise tax based on net income has been increased in

Massachusetts by an additional 1½ per cent imposition with respect to the calendar year 1948.

An additional new imposition was made in Missouri as a tax of 1 per cent of total receipts from car rentals by freight line companies was enacted in lieu of all *ad valorem* property taxation.

NEW JERSEY

A move towards simplification in reporting was provided with the introduction of a short-rate table for franchise tax computation for corporations having total assets of less than $100,000. The statute also provided that there shall be allocated to the state one-half of all intangibles of a domestic corporation having a business situs outside the state. A number of administrative changes were also provided in the statute, and special provisions were made relative to investment companies.

NEW YORK

A number of minor changes were effected with respect to corporation taxes in 1947. Among the pertinent statutes was one changing the provisions relative to interest and tax deductions in the determination of the franchise tax on business corporations. The same statute also provides for a change in the income-salary alternative method of tax computation. Another statute extended the filing time for review of corporation franchise tax liabilities as a result of the renegotiation of war contracts. It also provided for the prohibition against the inclusion of income gains or losses from subsidiary capital which do not include offsetting recoveries with regard to war losses.

In line with the inclusion of all temporary taxes within the permanent tax system, the emergency tax on utilities was made permanent at the prevailing 2 per cent rate. The enabling act authorizing cities to impose a 1 per cent utility gross income tax was continued to July 1, 1948.

NORTH CAROLINA, OHIO, OKLAHOMA

The rate of the franchise tax was decreased in North Carolina from $1.75 per $1,000 to $1.50 per $1,000 of capital stock, surplus and undivided profits.

The Ohio excise tax on utilities was extended to April 30, 1949.

The corporation income tax rate in Oklahoma was reduced from 6 per cent to 4 per cent, and similar reductions were effected with regard to national bank associations, state banks, trust companies, and other financial institutions.

PENNSYLVANIA

The corporation net income tax is continued at the 4 per cent rate for the years 1947 and 1948, and the same statute prohibits the deduction of net operating losses for years beginning in 1946. The 14-mill utility tax rate was continued for 1947 and 1948.

RHODE ISLAND

The state enacted a 4 per cent tax on the net income of business corporations for 1947 and 1948, or a tax at the rate of $.40 per $100 of corporate excess, whichever tax is greater. Corporations subject to the business corporation tax are required to pay only that amount by which the franchise tax exceeds the amount payable under the business corporation tax. The tax on electrical utilities was increased from 2 per cent to 2½ per cent of gross earnings, and the tax on communication companies was increased from 6 per cent to 7 per cent of gross earnings as of July 1, 1947.

VERMONT

The franchise tax measured by net income was increased from 2 per cent to 4 per cent with a minimum tax of $25, and certain administrative changes in the law were effected. A gross receipts tax on telephone companies was enacted at the rate of 4¼ per cent of entire gross operating revenues. A graduated alternative tax was provided.

BANK TAXATION

The basis for taxing savings banks in Maine was changed to $.30 per $1000 of average deposits during a six-month period.

A new tax was enacted in Missouri with respect to credit unions based on the taxable portion of dividends declared and credited to accounts of members. This levy is in lieu of general property taxation of such intangibles.

ESTATE AND INHERITANCE TAXES

By Mortimer M. Kassell
Deputy Commissioner and Counsel,
Department of Taxation and Finance,
State of New York

DEATH TAX CONVENTIONS

The Treasury Department established regulations and procedures for the United States-United Kingdom Death Tax Convention, effective July 5, 1947 (Treasury Decision No. 5565).

STATE LEGISLATION

Since most of the state legislatures held sessions in 1947 there was a great deal of legislation, of which it will be possible to mention only a small part.

The question of community property received treatment in several states. California (Ch. 735) excluded from community property, intangibles acquired in another domicile. Idaho (Ch. 37) exempted from tax all transfers of community property to the surviving husband or wife. Utah (S.B. 109) excluded from the estate one-half of the value of jointly held property, not exceeding $40,000. Oklahoma eliminated the surviving spouse's share in community property from the gross estate (H.B. 178), and exempted the acquisition of community property by husband and wife from the gift tax.

In the interstate field, opposing trends were evident. Colorado (S.B. 232) exempted gifts made to foreign, charitable and non-profit institutions on a reciprocal basis. Indiana (Ch. 311) allowed exemptions of transfers to foreign corporations only where the foreign state has a reciprocal exemption statute, and restricted deductions for non-resident estates to taxes and other liens against property transferred (Ch. 182). Maine (Ch. 259) allowed the deduction of amounts paid on account of Federal estate taxes in resident estates.

Laws involving exemptions were enacted in California and Utah. California exempted property transferred to dependents of a decedent who died in service during the Second World War (Ch. 820). In Utah, property transferred to husband, wife, or children of the decedent was exempted from the tax in the first two brackets, up to $40,000 in amount (S.B. 108).

Emergency taxes were made permanent in New York (Ch. 89) and extended to July 1949 in Wisconsin (Ch. 329). Nebraska changed the rate of tax on certain classes (L.B. 174), and North Carolina made rates of gift tax dependent on the aggregate gifts made by a donor to the same donee.

Delaware (H.B. 65) and Maryland (Ch. 156) made provision for prorating estate taxes equitably among inheritors according to the proportion of property bequeathed in each case. Colorado (H.B. 255) and Nebraska (L.B. 171) required allocation of tax on jointly held property by dividing the value of the property by the number of joint tenants. The classes of donees were redefined for death tax purposes in California (Ch. 734, 735). North Dakota made taxable life insurance in excess of $25,000, no matter to whom payable (S.B. 120). North Carolina provided (H.B. 25) for a $2,000 insurance exemption in certain cases; Oklahoma required insurers to furnish information on policies owned by decedents (H.B. 178).

New York (Ch. 812) provided a 15-year statute of limitations with respect to the transfer tax on decedents who died prior to Sept. 1, 1930. South Dakota limited the time within which the inheritance tax remains alive to six years (S.B. 49). Oklahoma required assessment of inheritance tax within ten years from date of death (H.B. 160), and defined "fair cash market value" (H.B. 178).

FEDERAL TAXATION

Several studies of Federal taxes were made during 1947. The Advisory Committee of the United States Treasury Department proposed integration of death and income taxes, with a single transfer tax imposed at the time of transfer of property. The Special Tax Study Committee of the House Committee on Ways and Means, reporting in November 1947, made 13 recommendations, including Federal credit for state taxes computed on the present tax schedule instead of the 1926 schedule; amendment of the Federal law to provide that gifts made more than two years before death were not made in contemplation of death; equalization of taxes between community property and non-community property states by exempting one-half of gifts between husband and wife and all property left outright by one spouse to the other up to one-half of the estate; installment payment of the estate tax over a ten year period. The Committee on Postwar Tax Policy recommended the exclusion of life insurance from the gross estate.

There was little Congressional action with respect to the Federal estate tax. The United Nations was added to the list of agencies to which tax-free bequests and legacies may be made (Chap. 7, sec. 5). By Chapter 143, Public Law 112, the period for tax-free release of powers of appointment created on or before Oct. 21, 1942, was extended to July 1, 1948. The same act extended gift tax relief for certain discretionary trusts to Dec. 31, 1947. On Nov. 18, 1947, the President revoked the executive order of 1935 relating to the preparation and publicity of decisions concerning over-assessments of income, profits, and estate and gift taxes allowed in excess of $20,000 (No. 9906, 12 F.R. 7799).

A group of decisions by several United States Circuit Courts of Appeal continued to interpret the decision in *Helvering v. Hallock,* 309 U. S. 106 (*Commissioner v. Church's Estate,* 161 Fed. (2d) 11). The conflict as to whether there is a limit to the remoteness of a taxable possibility of reverter continued in Circut Courts of Appeal. *Commissioner v. Singer's Estate* (161 Fed. (2d) 15), and *Bankers Trust Co. v. Higgins* (158 Fed. (2d) 957) held there was a limit. See, also, *Collins v. Commissioner* (164 Fed. (2d) 276). A tendency to apply the *Hallock* rule not only to irrevocable transfers but also to revocable transfers is seen in *Trust Company of Georgia v. Allen* (164 Fed. (2d) 438).

The question of whether powers reserved by settlors of pre-1936 trusts were powers "to alter, amend or revoke" was considered in a number of cases (*Hurd v. Commissioner,* 160 Fed. (2d) 610; *Theopold v. United States,* 164 Fed. (2d) 404; *Jennings v. Smith,* 161 Fed. (2d) 74; *Thorp v. Commissioner,* United States Circuit Court of Appeals, Third Circuit, Dec. 2, 1947).

AUTOMOBILE TAXES

By MILDRED GUFFIN
NEW YORK STATE DEPARTMENT OF TAXATION AND FINANCE

GENERAL

An important factor in the automobile tax situation in 1947 was the need for increased revenues. Almost all of the governors' messages to the state legislatures in session gave some attention to highway expenditures made imperative by war-time neglect. California's Governor Warren called the "outgrown highway system" a "tragic situation," and asked for an increase in the gasoline tax to improve the system.

Even without any addition to tax rates, the mounting consumption of gasoline and registrations of motor vehicles produced higher revenues. Startling increases, even over pre-war figures, were recorded. The national consumption of gasoline for highway use was more than 11 per cent greater in the first six months of 1947 than during the same period in 1946. The Public Roads Administration gives a preliminary figure for 1947 motor vehicle registrations of 37,164,405. In 1946, registrations were 33,945,817, and the previous record registration was 34,472,145 in 1941.

State receipts from both gasoline and automobile taxes in 1946 were higher than the pre-war figure in 1941, as well as higher than the previous year. Average state taxes per vehicle (combined automobile and gasoline) were $47.61 for the United States as a whole, and ranged from a low of $28.04 in Missouri to a high of $86.01 in Florida. The total was $1,333,561,000, constituting the largest state source of revenue, 27.3 per cent of total state collections. The latest available data for fiscal 1947 ending June 30 show total receipts of $1,664,000,000, which is 28.7 per cent of total collections (preliminary U. S. Census Bureau data).

Federal taxes were also correspondingly larger in 1946 and 1947 than in war years. Preliminary figures for the first eight months of the calendar year 1947 show receipts 41 per cent higher in 1947 than in 1946, with comparative totals of $742,000,000 in 1947 and $536,000,000 in 1946. Total collections for fiscal years ended June 30, 1946 and 1947 were $861,078,028 and $1,074,601,471, respectively.

There has been a great deal of agitation for repeal of the Federal excise taxes. Testimony was presented during the summer before the House Ways and Means Committee, but no action was taken. Even the Treasury Department, in its study, "Federal-State Tax Coordination," granted that the Federal Government might give up its gasoline tax, introduced as a temporary depression measure in 1932. Federal gasoline taxes are less than 1 per cent of total Federal revenue collections, while state gasoline taxes formed 18 per cent of total state collections in 1946.

PROTESTS AGAINST STATE POLICIES

Two state policies also evoked many protests—the extension of toll roads and the use of automobile tax receipts for non-highway expenditures. Laws for state toll projects were enacted in California, Colorado, Georgia, New Hampshire, Oklahoma, and West Virginia. The New York State legislature granted permission to Westchester County to collect 10¢ tolls on two previously free parkways. Revenues from all toll projects have been unexpectedly high; a sample survey indicates that 1947 exceeded 1946 by 10 to 25 per cent.

Although the percentage of state automobile and gasoline tax receipts devoted to non-highway purposes decreased from 15 per cent in 1941 to 6 per cent in 1946, legislation was introduced to forbid diversion in 12 states in 1947, and passed in Illinois, Florida, Massachusetts, Ohio, and Tennessee. The Illinois bill, which was not a constitutional amendment, became effective upon signature by the governor. In Ohio, the proposed amendment was approved by the voters in the November 1947 election. The Florida, Massachusetts, and Pennsylvania amendments will be voted on in 1948.

MOTOR FUEL TAXES

Gasoline tax rates were increased in eight states. Vermont raised its rate ½¢; the District of Columbia, Connecticut, Maryland and Rhode Island added 1¢; California 1½¢; Colorado and Maine 2¢. In New York, the two temporary emergency taxes of 1¢ each were made permanent. Temporary or emergency taxes due to expire in 1947 were extended in five states—Florida, Idaho, Ohio, Pennsylvania, and West Virginia.

Massachusetts included diesel fuel in its gasoline excise tax. Other states that passed legislation on diesel fuel were Idaho, Indiana, Michigan, and Pennsylvania. Idaho and Pennsylvania enacted new use fuel taxes at the same rate as their gasoline taxes. Michigan, which previously taxed diesel fuel under the gasoline tax, imposed a special use fuel tax of 5¢ per gallon, which is 2¢ higher than the gasoline tax rate.

The problem of tax evasion came up in Kansas, where a study indicated at least a 10 per cent loss through direct exemption of gasoline. Only Kansas and Oklahoma collect no tax on exempt gasoline; the other states provide for initial payment of all taxes, with subsequent refunds for exempt fuel. On the basis of the first six months' receipts, North Dakota's change from the exemption to the refund system is expected to gain nearly $1,000,000 in taxes in 1947.

Following the current trend toward permissive local taxes, Nevada authorized a 1½¢ increase to be used for county and city public roads. Twelve counties out of the 17 have voted against this increase.

MOTOR VEHICLE TAXATION

In California, more than 200 changes were made in the vehicle code, effective Sept. 19, 1947, among them increases in automobile registration fees from $3 to $6 and in commercial carrier fees based on weight. Colorado established new registration fees of $2 and $4 for trailers. In Maine, trucks must now be registered by gross weight instead of rated capacity; fees are graduated from $15 to $350. A new road tax on carriers similar to the Virginia law held constitutional in *Mason & Dixon Lines, Inc. v. Commonwealth of Virginia,* was also enacted, based on the amount of fuel consumed within the state. Carriers using more than the amount purchased within the state of Maine must pay a tax on the difference.

Several changes were made in Maryland. Passenger car registration fees of $15 and $23, based on shipping weight, were substituted for fees based on horsepower. The basis of truck fees was changed from chassis weight to a combination of chassis and gross weight, with fees graduated from $15 to $200. There are also new fees for trailers and semi-trailers, graduated from $5 to $200. The special fee per passenger mile for buses has been reduced, and the regular fees, based on seating capacity, now run from $75 to $150 per year.

Minnesota has a new schedule of registration fees graduated according to weight instead of valuation percentage, from $11 to $15, reduced 10 per cent the second year and 15 per cent each year thereafter. In North Carolina passenger car fees have been changed from $.35 per hundredweight to a fixed schedule graduated from $10 to $15. Beginning Jan. 1, 1949, Missouri registrations will be staggered, part expiring each month through the year.

North Dakota has increased its passenger car and truck fees by about 25 per cent for the first year of registration and reduced the fees by about 5 per cent for each subsequent year of registration.

The fees for heavier carriers in South Dakota have been increased about 15 per cent, rising to $525, and the fees for lower weights have been decreased to $3. Passenger carrier rates have also been lowered.

Vermont has increased its registration fees for passenger cars of 1937 or later vintage from $18 to $25. Fees for trucks now range from $.65 to $.95 per hundredweight.

Wisconsin, the tenth state to establish a flat fee, set $16 for all passenger cars regardless of size, age, and weight, but older cars previously subject to reduced fees will continue to receive a 25 per cent reduction until they are junked.

Progress continues in reciprocal arrangements between the states, with new laws in Connecticut, Georgia, Maine, Montana, New Mexico, North Dakota, Texas, Vermont, West Virginia, and Wisconsin.

New York State responded to city and county pleas for more state aid by authorizing municipalities to impose use taxes of $5 and $10 on passenger cars, depending on weight, and $10 on commercial vehicles. No county has yet taken advantage of the authorization.

OPERATOR'S LICENSES

Changes in operator's license laws include doubling the rate in Arkansas (50¢ to $1), amendments in Montana, and a complete new act in Wyoming, with rates of $1 for the operator's license for three years and for the chauffeur's license for one year. Beginning Jan. 1, 1948, California charges $2 for a driver's or chauffeur's license. Idaho and Indiana have staggered expiration dates of operator's and chauffeur's licenses by providing they shall expire every two years in the birthday month of the holder, and Colorado put the date every third year on the operator's birthday.

South Dakota achieved wide notice as the only state without a driver's license law; its governor has expressed concern, and a bill was introduced in the 1947 legislature, but failed to pass. A Federal bill to license drivers introduced in the House of Representatives never passed out of committee.

FINANCIAL RESPONSIBILITY

Financial responsibility laws substantially in accordance with the uniform code were adopted for the first time in Arkansas, Florida, New Mexico, and Wyoming. Amendments to make the laws correspond more closely to the uniform code were enacted in California, Connecticut, Idaho, Iowa, North Carolina, North Dakota, Maine, and Vermont. Colorado has a new law applying to nonresidents as well as residents. Proposals for compulsory insurance were introduced in several states but failed to pass.

DIVISION VIII

PUBLIC RESOURCES AND UTILITIES

FEDERAL SURVEYS AND MAPS

By J. O. Kilmartin
Acting Chief, Map Information Office, U. S. Geological Survey

GENERAL

During 1947, the Federal surveying and mapping agencies mainly devoted their efforts toward mapping needed for the post-war development of the United States and its territories and possessions. The great demands made on this country to supply all kinds of materials to the war-stricken countries; the augmented need for products from our natural resources such as timber, oil, minerals, metals, and food to support our own economy; and the focusing of attention on the relatively undeveloped areas in the West as the only remaining fields for orderly expansion, all combined to give fresh and heavy impetus to the demand for maps to serve not only current needs but also as a basis for long-range planning. More and more, mapping needs were analyzed in joint studies between Federal agencies and state governments with due consideration also given to the interests of industry and the public. Consequently, activities of map-producing agencies were, to the greatest extent possible, correlated concurrently toward meeting present primary objectives and also to dovetail into the comprehensive program for completing the mapping of the whole country.

Major efforts continued to be directed toward surveying and mapping the principal river basins of the West such as the Missouri, Columbia, and others. Alaska was given a full share of thought and attention with the result that a very substantial program is contemplated and partly under way. In addition, numerous mapping projects were in progress in states in the eastern and central parts of the United States, and as a corollary activity, vast areas all over the country were photographed from the air.

However, in terms of complete topographic mapping of the continental United States, the present rate of progress would require the next 40 or 50 years, and during that time many of the maps would require at least partial revision. Consequently, for the country to be adequately mapped within a reasonable period and for the maps to be adequately maintained, the present rate of operations should at least be doubled. The Geological Survey is continually supporting this objective in order that our map status may fulfill minimum needs and be comparable to that of other leading nations of the world.

In the field of military mapping, efforts continued to be directed along two lines of equal importance. The first was the continuing preparation and maintenance of such maps and charts of both domestic and foreign areas as are considered necessary in the defensive interests of the United States. The second relates to the never-ending research and development of new instruments, techniques, and scientific discoveries for application to geodetic, hydrographic, and reconnaissance surveys and to navigation. Major accomplishments were achieved in both of these fields, and, in the latter, civilian agencies remained alert to apply promising developments to their surveying and mapping procedures.

SURVEYING AND MAPPING AGENCIES

The surveying and mapping activities of the Federal Government cover a very broad scope, and include geodetic, geologic, hydrographic, topographic, cadastral, soil, and many other types of surveys as well as map compilation involving innumerable subjects and purposes for both military and civilian use.

It is the responsibility of the Bureau of the Budget, in the Executive Office of the President, to coordinate and promote the improvement of the surveying and mapping activities of the Government. For example, representatives appointed by the principal Federal departments and establishments that are important users of topographic maps, provide the Bureau with annual priority statements in graphic form indicating their mapping needs. Four classes of priority are indicated along with the requirements as to map scales. State Planning agencies also submit similar statements showing their mapping needs. These expressed consumer needs are analyzed and, with assistance from the principal map producers, an overall mapping program is developed.

After appropriations have been made by Congress, the Bureau assists the map and chart producing agencies in preparing their revised schedules of operations, and these schedules are carefully reviewed so that duplications and gaps may be eliminated. Each map producing agency submits to the Bureau quarterly reports, graphic and tabular, showing progress of operations. Quarterly cost reports on map and chart production including their reproduction, are also submitted by each agency. These reports are analyzed and the map producers are given the benefit of this analysis so that they may effect economies and improve upon methods and operating procedures. The Bureau advises and assists the mapping and charting agencies in the technical aspects of their operations, and guides them in carrying out cooperative activities. Also it encourages the investigation of new methods and instruments and the adoption of any innovations offering advantages in efficiency, accomplishment, or economy.

The accomplishments of the various producing agencies as well as those whose main interest is in map research and the maintenance of important map libraries, are presented in the statements that follow. They have been arranged in alphabetical order, on an agency basis. Except in the case of independent bureaus which have no connection with departments, the parent department is indicated after the agency name by means of a capital letter in parenthesis, thus: (A)—Agriculture; (I)—Interior; etc.

AERONAUTICAL CHART SERVICE (N.D.—AIR)

The Aeronautical Chart Service is responsible for providing maps and charts of foreign areas required by the Air Force and civilian aviation agencies of the United States. This responsibility entails the procurement and collection, cataloging and storage, and supply and distribution of all types of foreign and domestic aeronautical charts. Procurement may include either the purchase or exchange of maps and charts produced by other domestic or foreign mapping agencies or the original compilation and reproduction of aeronautical charts or special maps required by the Air Force.

Three series of charts each provide coverage for the entire land area of the world. The series designated as Planning Charts consists of 43 sheets at the scale 1:5,000,000. The group of Long Range Navigation Charts includes 76 sheets at the scale 1:3,000,000. The series designated as World Aeronautical Charts, scale 1:1,000,000, consists of 896 sheets, of which 838 are of foreign areas and 58 cover the United States and its possessions. In addition to these, numerous flight charts, special maps and charts, and aeronautical publications are required by the Air Force and civil aviation.

During the year, approximately 1,200,000 square miles of trimetrogon aerial photography was used in the revision and recompilation of the World Aeronautical Chart series. Present plans provide that an equal, or greater, amount of coverage will be compiled during the coming year.

The 1948 program will include the preparation of a special series of charts of the north polar area. This group, consisting of eight charts, will be known as the Polar Navigation Chart series.

The production for distribution by this service during 1947 reached a grand total of 8,452,672 copies of maps, charts, and special publications.

ARMY MAP SERVICE (N.D.—ARMY)

The Army Map Service of the Corps of Engineers is responsible under the Direction of the Chief of Engineers for providing maps required by the Department of the Army. During periods of hostilities this responsibility is divided between the Army Map Service and theater commanders working on a coordinated program. Responsibilities of the Map Service include the compilation of operational and training maps and photomaps, reproduction of maps and related material, preparation of terrain models required for military training and operations, maintenance of the Department of the Army Map Library, issuance of maps for military purposes, investigation of new and improved cartographic techniques which are applicable to military mapping, and the maintenance of files of worldwide geodetic data.

During the year, 2,850 new and revised maps were prepared and over 14,030,850 copies were reproduced. Preparation was started on 4,040 basic maps. The Library acquired about 150,000 new maps and over 9,000 books and documents related to maps and mapping. The total holdings of the Library now exceeds 1,000,000 separate items.

In its present activities, the Army Map Service is concentrating on the expansion of its Library to provide topographic maps, geodetic data, and related mapping intelligence which would serve as compilation source material for Department of the Army maps; the preparation of operational, strategic, and planning maps of foreign and domestic areas; the preparation of such terrain models as are required by the Department of the Army; and large scale maps required for civil works activities of the Corps of Engineers. Of particular interest in domestic operations is the preparation of a scale 1:250,000 strategic map in 469 sheets covering the entire United States. Seventeen of these maps were published in 1947 and 228 additional sheets were started.

The depository program inaugurated in 1945, whereby copies of Map Service Library holdings are made available to universities and scientific institutions, continues to operate with increased popularity with these institutions.

BOARD ON GEOGRAPHIC NAMES (I)

On July 25, 1947, the President approved legislation, P.L. 242, that authorized the geographic names work long carried on under Executive Orders. The act abolished the United States Board on Geographical Names and created a new Board on Geographic Names that, conjointly with the Secretary of the Interior, is charged with centralizing the standardization of geographic names for the Federal Government.

During the calendar year, there were rendered 2,790 name decisions, including 237 on domestic names and 850 on Antarctic names. The publication entitled *The Geographical Names of Antarctica* included an exposition of the Antarctic nomenclature problem, a list of expeditions to Antarctica, and a full statement of name policies and their application.

More than 6,800 telephone and mail

inquiries were answered, more than double the number in 1946. About 20,000 copies of technical bulletins and decision lists were distributed. Directions for the treatment of geographical names in 10 areas in this hemisphere were published. Preliminary examination was completed for 18 other areas. The foreign name files of the Board were augmented by the processing of large numbers of names for Government maps and reports.

BUREAU OF LAND MANAGEMENT (I)

The Bureau of Land Management executes cadastral surveys and resurveys in the 29 Public Land states and Alaska, which constitute the original public domain. Such surveys are necessary for the identification, management, and disposal of the public lands.

The official plats are prepared on a standard scale of 1 inch equals 40 chains although in special cases scales of 1 inch equals 20 chains and 1 inch equals 10 chains are used. The Bureau also compiles and publishes maps of the Public Land states on a scale of 1:760,320 (1 inch equals 12 miles) and the official wall map of the United States on a scale of 1:2,344,320 (1 inch equals 37 miles). These maps show the extent of the public land surveys and the location of the national parks, Indian Reservations, grazing districts, national forests, reclamation projects, and other Federal reservations.

During the fiscal year 1947, cadastral engineering activities were carried on in 19 states and Alaska. Surveys and resurveys under the rectangular system, aggregating 2,925,012 acres, were completed in addition to field investigations and miscellaneous survey projects not measurable on a quantity basis. These surveys are represented on 245 plats prepared in final form, which, together with the official field notes, constitute the complete permanent record.

An important part of the field work involved the surveys and resurveys in the Missouri River Basin in North and South Dakota, Montana, and Wyoming. This work was carried on in cooperation with the Bureau of Reclamation and the Corps of Engineers, U. S. A. The Missouri Basin program contemplates the resurvey of approximately 10,000,000 acres along the Little Missouri, Powder, Cheyenne, and Moreau rivers. In addition to recovering and monumenting the public land corners for the identification of land boundaries, these surveys afford control for extension of topographic mapping within the Basin.

The map compilation activities of the Bureau for 1947 include work on the revision of the map of Wyoming which is nearly completed. Some revision has been made of the official map of the United States, and a new edition will be printed in 1948.

BUREAU OF RECLAMATION (I)

The Bureau of Reclamation, in carrying out its responsibilities for development of the water resources of the West, has a great and continuous need for all kinds of maps. First of all, it uses numerous quadrangle maps prepared by the Geological Survey, and, in cooperation with the Survey, finances the preparation of such maps in areas when immediate needs require higher priority work than the normal demands on the Geological Survey would permit. In addition, the Bureau, using specifications approved by the Survey, awards contracts for aerial surveys and mapping in areas urgently needed for carrying on important investigations and construction of irrigation projects. During the calendar year 1947, contracts were awarded by the Bureau for photography and photo mosaics at various scales from 1:4800 to 1:24,000 in areas totaling approximately 3,500 square miles in California and South Dakota. Approximately 280 square miles of topographic mapping at a scale of 1:4800 with a one-foot contour interval was completed by the plane table method in Texas.

The Bureau of Reclamation is not a primary map-making agency and undertakes to contract for such work or to perform such operations only when existing maps of suitable quality are not available, and primary map-making agencies can not undertake to prepare suitable maps by the time needed, or when the mapping is a specialized type peculiar to Bureau needs.

U. S. COAST AND GEODETIC SURVEY (C)

This agency is charged with surveying and charting the coastal waters under United States jurisdiction; executing geodetic control surveys in the interior; compiling aeronautical charts for civil aviation; investigating tidal and magnetic phenomena; and making earthquake investigations. The results of these surveys and investigations are made available to the public in the form of nautical and aeronautical charts, Coast Pilots, Tide and Current Tables, geodetic control data, and magnetic and seismologic publications.

Hydrographic surveys, covering 52,562 square miles and including 47,856 miles of sounding lines, were made in Alaska and along the Atlantic and Gulf coasts. Shoran, for determining the position of the survey vessel, was successfully used, for distances up to 50 miles from shore, in the western Aleutians and on the Atlantic Coast. A new electronic position indicator, developed in the Bureau, was used on surveys in the Gulf of Mexico. The use of this instrument will permit the extension of accurate hydrographic surveys for distances up to 300 miles from shore.

During the year, 13 new nautical charts, 77 new editions, 502 new prints, and 52 reprints were published. Over 1,250,000 nautical charts were issued. The total number of nautical charts published to date is 892, of which 166 are of Philippine waters. Five of the new series of 33 Gulf Intracoastal Waterway charts were published, and eight more were in various stages of completion. This project will cover 1,076 miles of coastline from Carabelle, Fla., to the Mexican border. Several experimental charts for use in Radar navigation were published, including a chart for use with Loran.

Geodetic control surveys for major engineering and mapping projects, such as those planned for the Columbia River Basin, Kentucky Reservoir, and Missouri and Trinity River valleys, were continued under priorities arranged with the Corps of Engineers, Bureau of Reclamation, and other agencies. Detailed urban control surveys in cooperation with local agencies were executed in several localities. Surveys were made as follows: First- and second-order triangulation, 4,140 linear miles covering 76,665 square miles of area; first-order base lines measured, 27, totaling 93 linear miles; first- and second-order traverse, 133 stations, covering 43 miles; astronomic stations occupied, 10; first-order levels, 3,494 miles; and second-order levels, 7,599 miles. Reconnaissance for future triangulation extended along 6,052 miles of arc, covering 102,800 square miles of area. The elevations of 13,565 bench marks were determined, and 2,808 new triangulation stations were located. Gravity determinations were made at five stations in the Hawaiian, Palau, Admiralty, and Solomon islands for the War Department. Levels were run to 86 airports, making a total of 712 airports at which sea level elevations have been determined and connected to the Federal network of levels. Computations and adjustments were completed for 92 triangulation projects, involving 6,625 stations for which geographic positions (latitudes and longitudes) were adjusted. A special control survey to mark the Virginia-District of Columbia boundary, assigned to the Bureau by act of Congress, was completed.

The aeronautical charts of the United States and possessions, 789 different charts in all, were maintained. These include 226 standard charts, 521 instrument approach and landing charts, and 42 radio facility charts. The latter is a new series covering the United States and provides complete radio data for planning and executing cross-country flights. Nearly 13,000,000 aeronautical charts were issued. Of special interest was the publication of a new route chart, Chicago, Illinois to Gander, Newfoundland, designed to meet the requirements of air carriers operating over the North Atlantic with high-speed, high-altitude, long-range aircraft. The second of a series of aircraft position charts, covering western Europe and northwestern Alaska, was published for the use of the military forces and air carriers operating certificated overseas routes.

Air photographs of 11,255 square miles, mostly in Alaska, along the Gulf Intracoastal Waterway, and in selected areas along the West Coast, were taken in collaboration with the Coast Guard. These photographs were used for nautical chart revision and for the compilation of planimetric and topographic maps. About 200 airports were photographed for use in making airport surveys.

Surveys in the Philippines have been resumed by the Bureau under provisions of the Philippine Rehabilitation Program. The Bureau also participated for the seventh consecutive year in the "Cooperation with the American Republics" program of the State Department. Under this program Bureau experts are assigned to the various countries in advisory capacities, and fellowships are given to qualified persons from the Republics for study in field methods and reproduction processes.

FEDERAL COMMUNICATIONS COMMISSION

A large percentage of the maps prepared by this agency are primarily for use in connections with hearings and long-range service studies. These maps are usually of interest only to radio engineers and others in the radio profession. All maps presented at hearings are public documents and may be obtained or examined at the Commission's offices, unless legal restrictions apply.

Data used in map compilation is generally obtained by engineers of the Commission as a result of actual measurement and field survey work. Base maps are provided by the Coast and Geodetic Survey, the Bureau of the Census, and other agencies. Certain of these maps which are of general interest are published in periodicals from time to time.

Maps completed or in process include those in the following general classifications: Coverage of stations, particularly standard broadcast, FM, and television; national coverage of various classes and combinations of Aural Broadcast Stations; maps relating to broadcast in interference and inspection and monitoring regions; coverage showing telephone and telegraph networks within and emanating from the United States and its possessions; maps of ground conductivity for the United States and Canada and a similar one in preparation for Cuba; nationwide television station allocation plan; and numerous other maps pertaining to frequency allocations, airways communication, directive antenna patterns, service locations, radiated field of foreign broadcast stations, and direction charts.

CORPS OF ENGINEERS (N.D.—ARMY)

The Corps of Engineers is responsible for all maps and surveys required by the Department of the Army. In this capacity the Corps, through the Chief of Engineers, directs the activities of many large organizations such as the Army Map Service, Mississippi River Commission, U. S. Lake Survey (all reported separately), and the District Engineer Offices which perform considerable survey work incidental to river development and other activities. Maps for military purposes are normally produced in the United States by the Army Map Service, and overseas by topographic organizations of the Corps. During the year efforts of the Corps of Engineers military mapping facilities were primarily concerned with the preparation of maps throughout the world that are of potential interest to the Department of the Army.

Mapping in the United States was generally confined to small scale strategic maps required by the Department of the Army, large scale maps of military training areas, lake navigation charts, and engineering maps required for civil works activities of the Corps.

Maps involving direction finding activities concerning illegal radio station operation interference, or safety of life at sea and in the air, are prepared by the Commission but are not generally available to the public because of their confidential nature.

Booklets with maps are supplied to the Army, Navy, Civil Aeronautics Administration, and Commercial Airlines with instructions for obtaining Federal Communications Commission bearings for airplanes or other mobile units.

The maps produced by the Commission are of primary interest to radio engineers and communications companies as far as station coverage and interference are concerned and to navigators for direction finding and bearing activities.

FEDERAL POWER COMMISSION

The Federal Power Commission prepares and publishes maps relating to the production and distribution of electric power and natural gas. The electric power maps of the Commission are issued in four series which include regional maps consisting of 11 main sheets, electric survey maps comprising 84 principal map sheets, state maps now in process of preparation, and a wall map on a national basis, published in 1941 and scheduled for early revision.

The series of Regional Transmission Maps of the United States is made up of 11 map sheets and six sheets of inserts containing information on an enlarged scale for congested areas. The 11 map sheets are on a scale of 32 miles per inch and the inserts are drawn to various larger scales. All are printed in black and white. These maps show all power stations, both hydro and fuel, of public and private electric systems and of industrial companies, with a capacity of 1,000 kilowatts and over, all transmission lines of 22 kilovolts and over, and main substations. Accompanying this series is a plant book, listing by states not only the operating utilities but also the power stations, both keyed to code numbers. The latest revision was November 1945. A current revision is bringing the Regional series up to date as of June 30, 1947. These maps are available separately or in sets.

During the war, the U. S. Corps of Engineers, owing to press of war work, turned over to the Commission their series of Electric Survey Maps for revision. This set consists of 84 map sheets, a key map, and four power zone sheets. For this series, the United States was divided into 84 rectangles. The revision was completed in 1946. These maps show electric facilities, except distribution, for all public and private electric utilities and principal industrial companies; power stations, both hydro and fuel; transmission lines 22 kilovolts and over, and principal substations. They are available in single sheets or assembled sets.

There is now in preparation a map series on a state basis which will be printed in colors. It will contain, besides the latest available information shown on the earlier series, principal communities served by each utility with connecting lines. The colors will define the properties by holding company groups. These maps will be on a scale of 10 miles per inch in states where electric facilities are congested and 20 miles per inch in other states. It is expected that maps of this series will be available in both individual sheets and assembled sets.

In 1941 a Wall Map of the United States was published and is still available. It is expected that, upon the completion of the series of state maps, this wall map will be revised and brought up-to-date.

The Commission has completed and published natural gas maps for all states except California, Nevada, Washington, Oregon, Idaho, North and South Carolina, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New Jersey, and Florida. Maps for California, New Jersey, and Florida have been compiled but not yet published. These maps are published at a scale of approximately 18 miles per inch on 19 x 26 inch sheets. Attached to each is a printed list showing the "Company Ownership and Communities Served."

The Commission expects soon to issue a new Wall Map printed in colors at an approximate scale of 60 miles per inch—"Principal Natural Gas Pipe Lines in the United States and Communities Served with Natural, Manufactured, and Mixed Gas, 1948," with company names printed thereon.

PRODUCTION AND MARKETING ADMINISTRATION (A)

The Production and Marketing Administration is continuing to use ratioed aerial photographs and mosaics in administering its Agricultural Conservation, Allotment, and other programs. It is continuing its program of securing new aerial photography and is rephotographing many areas to replace obsolete photography. The amount of new photography secured during 1947 was approximately 60,000 square miles.

FOREST SERVICE (A)

This agency prepares topographic and planimetric maps required for adequate Forest Administration and development. Areas to be mapped are selected from consideration of factors such as value of timber stands, their accessibility, and relative location. Administration maps are mostly compiled or prepared with planimetric data, but, where necessary, topographic data is also included. Constant checking and revision is a continuing function. Active topographic mapping areas are located in Arizona, California, and Washington. Planimetric work is in progress in California, Oregon, Washington, Idaho, Montana, and Mississippi.

Currently, a sustained effort is being directed to standardize the content of planimetric maps at the various reproduction scales to improve appearance and utility for administrative uses. The Forest Service is cooperating with other Federal mapping agencies in the Joint Map Practice Committee and will follow its decisions in this standardizing procedure.

Existing assignments of work for the Hydrographic Office of the Navy Department are being completed and a small mapping project for the Corps of Engineers Army Map Service is well under way.

U. S. GEOLOGICAL SURVEY (I)

This agency is responsible for making and maintaining an inventory of the nation's mineral wealth and its terrain as well as water resources. The terrain inventory—topographic surveys—covers little more than half of the country and much of the earlier reconnaissance work is badly in need of revision to meet present requirements. During the year, mapping work was accelerated by increased cooperative programs with state agencies, by augmented requirements of Federal agencies particularly in areas such as Alaska, Missouri River Basin, and Columbia River Basin, and by large assignments from the military for maps of Army Posts, Camps, and Stations, and aeronautical charts of many foreign areas. Revision of obsolete or otherwise inadequate maps also constituted a major activity, particularly with reference to large areas in California.

In the year, 175 new topographic maps were published, in addition to 445 reprints of maps whose stocks had become exhausted. A number of special maps and geologic maps were published as well as those included in professional papers, bulletins, and water supply reports. Work continued on the series of Transportation Maps of the United States, the series of the Millionth Scale Map of the World, the new compilation and revision of State Maps, and Aeronautical Charts for the Air Forces. The major part of the new topographic mapping was for areas in California, Missouri, Illinois, Indiana, Idaho, New York, North Dakota, Nebraska, Mississippi, Texas, and Pennsylvania.

In the Missouri River Basin approximately 3,000 square miles of topographic surveys and control for 10,000 square miles more were completed. In the Columbia River Basin control for 550 square miles of mapping was established. Approximately 6,000 square miles of mapping of Army Posts, Camps, and Stations were completed and an additional 6,500 square miles of area control were established for use by the Army in mapping. In total figures, new topographic mapping covered about 35,000 square miles. New horizontal control amounted to 12,500 square miles. Vertical control involved 18,400 square miles. Supplementary control covered approximately 31,000 square miles.

In connection with geologic and topographic surveys, 126,000 square miles of aerial photography were procured, and contracts were awarded for 69,500 square miles of additional coverage.

The aeronautical charting of foreign areas for the U. S. Air Forces was continued on a basis of both revision and new compilation, with emphasis on the former. Revision was accomplished on charts covering approximately 850,000 square miles of territory, while new compilation was completed for about 450,000 square miles of area. Work was continued on the Antarctic Project and several other special assignments for the Air Forces. The standard charts are compiled at intermediate scales for publication at small scales such as 1:250,000 and 1:500,000. Contours having intervals of 500 feet and in some cases 1,000 feet are added by means of photogrammetric processes involving the photo alidade. For all aeronautical charting work, the Trimetrogon system is utilized.

The preparation of the Transportation Map of the United States, scale 1:250,000, was continued for the Public Roads Administration. Thirty-five sheets in Alabama, Indiana, Missouri, and Mississippi were in various stages of compilation, inking, and checking. Twenty-one sheets in Nevada and Ohio were transmitted for reproduction and 17 sheets in Virginia, District of Columbia and vicinity, and West Virginia were in various stages of reproduction. Eight sheets in North Carolina were published.

Progress continued on the Millionth Scale Map of the World. Compilation, inking, and checking were carried forward on the I-11 (Los Angeles) and J-17 (Blue Ridge) sheets, and preliminary work was continued on the H-17 (St. Augustine) sheet. The I-17 (Savannah) sheet was transmitted for reproduction. Sheets designated as K-16 (Chicago), K-17 (Lake Erie), K-18 (Hatteras), K-10 (Mt. Shasta), L-10 (Cascade Range), H-14 (Austin), and K-16 (Mississippi Delta) were in various stages of reproduction at the end of the year.

In revision of state maps (new compilations), the preparation of the original manuscripts for Wyoming, New Jersey, Massachusetts, Rhode Island, and Connecticut was completed and the manuscripts were transmitted for reproduction. Compilation, inking, and checking were in progress for Maryland, Delaware, Illinois, and Iowa.

Mapping operations in Alaska are directed toward two major objectives, the preparation of the Alaska Reconnaissance Map Series, scale 1:250,000 and the completion of standard topographic mapping at the scale 1:62,500. The reconnaissance maps each cover quadrangles one degree of latitude in length and three, four, or five degrees of longitude in width, containing an average area of about 8,000 square miles. These maps are compiled from existing source materials, control, and trimetrogon photography. Over 100,000 square miles of such compilation was in progress during the year. The larger scale standard topographic mapping has been undertaken in areas of special geologic or development interest. Work is now under way on about 8,000 square miles of such mapping in central, southeastern, and southwestern Alaska. In connection with this mapping program, plans have been made to obtain vertical aerial photography of all of southeastern Alaska and a large area in central Alaska. Control work has been progressingly advanced.

During the year, extensive revision and reprinting were accomplished on the two basic general maps of Alaska —Alaska Map E, scale 1:2,500,000 and Alaska Map A, scale 1:5,000,000. Map E will be used as a base for establishing the pattern of quadrangle coverage.

Modern mapping has become a series of closely integrated and highly specialized processes. In each of these processes there is a fertile field for the application of scientific developments engendered by the war and the following peacetime research. During the year, the Geological Survey closely examined this whole field to segregate for particular attention and study those elements of electricity and electronics, optics, mechanical instrument design, photography, including new film emulsions, recording devices, aircraft, light metals, and related subjects which may be applicable to mapping for either efficiency, economy, or improved accuracy.

Three German and two Swiss precise photogrammetric plotting instruments were acquired and put into operation both on test and production bases. Four new photogrammetric plotting instruments of domestic origin were in various stages of design, construction, trial tests, and production operation. Of these, three originated in this agency and the fourth was developed in conjunction with another government agency. Major improvements were also made on the plotting equipment now mainly used by the Survey.

In the field of aerial photography investigation, design, and development was carried forward on cameras and recording devices captured from the Germans, lenses remarkably free from distortion, and the application of infra-red photography for use in stereo photogrammetric plotting equipment. Future activities will include tests to determine adaptability and advantages of helicopters for taking aerial photographs.

New types of electronic altimeters developed by commercial concerns are scheduled for field trials in the near future. These are intended for differential leveling in the extension of vertical control for mapping.

During the year, an electrical survey net adjuster was designed, constructed, and is now in production use. In this, survey lines comprising the usual network pattern required for mapping are simulated by electrical circuits. Simultaneous adjustment of the component lines is accomplished through voltage measurements. Results comparable to precise mathematical adjustments by the least squares method are obtained with far greater ease and economy.

In keeping with the many developments in the operational phases of mapping, considerable effort has been directed to the analysis and standardization of mapping procedures. New instructions and technical memoranda have been prepared to support all changes. Eventually, all parts of the present *Topographic Manual* affected by new methods and developments will be replaced by new instructions.

The Map Information Office continued to function in its designated capacity. Details concerning its accomplishments are given under the separate report for that office.

HYDROGRAPHIC OFFICE (N.D.—NAVY)

At the end of the year, the Hydrographic Office had on issue approximately 4,600 nautical charts, 340 aviation charts, and 150 nautical and aviation publications.

During the year, this Office published a total of 280 new editions of nautical and special charts, which are further subdivided as follows: 100 replacements of reproductions of foreign charts, 39 compilations from foreign data, 74 new editions, 17 new charts from U. S. Naval Surveys and 50 special and miscellaneous charts.

Among the more notable accomplishments were: (1) the publication of a complete new *Index-Catalogue of Nautical Charts and Publications*, of larger size and scale and an increased number of individual index sheets; (2) the publication of a new series of isomagnetic charts showing magnetic inclination or dip, horizontal intensity, vertical intensity, total intensity, north and east components, and variation of the compass for the North and South Polar regions, and the World; (3) a new series of position plotting sheets on scale 1° longitude 0° to 65°.

The major program of this Office continues to be the replacement of reproductions of foreign charts, the issuance of which has been necessary for many years. At the end of the year, approximately 1,500 foreign charts remained to be replaced by standard U. S. Navy charts. It is expected that this program will continue until 1953 before complete independence from foreign sources will be accomplished.

Two fully equipped large survey ships, the *U.S.S. Tanner* and *U.S.S. Maury,* plus several smaller ships of the AGSC Class, were engaged in surveys of the East Coast of Mexico, and islands of the Caroline group in the Pacific.

Triangulation computations and adjustments were made for areas in Antigua, Bahama Islands, Bikini Atoll, Cuba, and Haiti.

Approximately 88,000 photo prints of the 1947 Antarctic Survey Expedition were catalogued, indexed, and filed. Supplementary information and control will be obtained by the 1948 Expedition for the correction of existing charts and publications.

Photographic compilations of the East Coast of Mexico are proceeding in advance of the hydrographic surveys.

Nine new Loran and three new miscellaneous aviation charts were compiled and printed, while new editions of aviation charts totaled 124, divided mainly between the V-70, VR, V-30, V-14 and Loran series.

One new Naval Air Pilot and two Weather Summaries were completed.

During the year, 128 aviation and Loran charts and 11 publications were canceled, with two charts being withdrawn from issue.

The program of new aviation and Loran charts being now essentially complete, a maintenance plan was prepared in which the 230 large size charts were divided into three groups to be revised at 1-, 2-, and 3-year intervals. This program requires the preparation of 160 new editions of these charts per year, exclusive of Loran charts.

In order to reduce the time to make revisions and to reduce the frequency of printings, it was necessary to change the specifications of the V-14 series of charts. This was accomplished by substituting contours for color gradients, elimination of frequencies of all radio navigation aids, and headings and diagrams of the radio range legs.

The preparation or correction, and issuance of other special publications such as Pilot Charts, Sailing Directions, Radio Aids, navigator's manuals and special tables continued throughout the year but at a slower rate than for the year 1946.

INTERNATIONAL BOUNDARY COMMISSION

This Commission is charged with the establishment and maintenance of the international boundaries between the United States, Alaska, and Canada.

During the year, maintenance work was undertaken on four sections of this boundary, (1) Lake of the Woods and Rainy River, Minnesota-Ontario boundary; (2) Forty-ninth Parallel from Northwest angle of Lake of the Woods to Pembina Mountains (completed), Minnesota-Manitoba boundary and North Dakota-Manitoba boundary; (3) Georgia, Haro, and Juan de Fuca Straits, Forty-ninth Parallel to Pacific Ocean, Washington-British Columbia boundary; (4)

Kelsall River, Alaska-British Columbia boundary.

The work comprised inspection of monuments, triangulation stations and bench marks, and repairs to those found damaged; triangulation and traverse surveys for determining the position of those found displaced; and re-clearing a 20-foot vista along the boundary through timber. In all, 540 miles of boundary were covered, and 86 miles of vista were re-cleared. Numerous monuments were inspected or repaired or moved, and 200 triangulation stations were recovered while a number of others were occupied.

INTERNATIONAL BOUNDARY AND WATER COMMISSION

This Commission executes surveys and prepares maps needed for the official discharge of its responsibilities in connection with the United States-Mexico boundary and with the administration of the water resources along it.

Accomplishments during the year include aerial surveys along several sections of the Rio Grande River from San Ygnacio to Roma, Tex.; from Roma to the Gulf of Mexico; between the upper end of Quitman Canyon, Tex. and the Lajitas, Tex.; from the mouth of Devils River to San Ygnacio, Tex. These projects totaled approximately 3,000 square miles of photography. Scales are mainly 1:20,000 with some large scale work at 1:6,000. In addition, a large scale aerial survey was made of the cities of Calexico, Calif., and Mexicali, Baja California.

In cooperation with the Mexican Section of the Commission, a topographic map was prepared of the Colorado River Floodway from the upper boundary line between California and Baja California to the lower boundary line between Arizona and Sonora. The Commission also prepared a topographic map showing terrain on both sides of the Rio Grande River between Penitas, Tex., and the river bridge connecting the towns of Hidalgo, Tex. and Reynosa, Tamaulipas, Mexico.

In addition to the above projects, this agency completed miscellaneous local surveying and mapping work in connection with its construction projects.

LAKE SURVEY OFFICES (CORPS OF ENGINEERS) (N.D.—ARMY)

The Lake Survey of the Corps of Engineers maintains charts of the Great Lakes, Lake Champlain, New York channels, Lake of the Woods, and Rainy Lake, primarily for navigation use. They show the hydrography of water areas and topography of limited areas of the contiguous shores and islands so as to show the docks, structures, and landmarks visible from the lakes and channels. Various scales are employed to portray features in adequate detail for the purpose of the different classes of charts. The small scale of the general lake charts is suitable for the needs of open-lake navigation; the medium scales of coast, river, and sectional charts afford greater detail for the closer navigation in the areas covered; and the largest scales show the details pertinent to restricted navigation in harbors and confined localities.

During the year, activities were limited to maintenance and revision of charts. Plans for 1948 include revision of charts of Lakes Superior and Huron, and St. Marys, St. Clair, and Detroit rivers. Data for these revisions were obtained by field parties.

Field work scheduled for 1948 includes examination and revision surveys on Lakes Erie and Ontario, and the Niagara and St. Lawrence rivers. Soundings will be taken in inshore waters of Lake Erie. In addition, hydraulic field work will be accomplished on the Detroit and St. Clair rivers.

LIBRARY OF CONGRESS

The Division of Maps of the Library of Congress administers a collection of approximately 1,000,000 maps (2,000,000 items), 16,000 atlases, gazetteers and pamphlets (19,000 items), and 70 globes, which give extensive areal, subject, and historical coverage. To enrich these collections come all maps, geographical atlases, and globes deposited for copyright, all unclassified maps published by Federal agencies, thousands of maps and atlases received through international exchange and many items acquired by purchase and gift. In addition, the Library's general collections contain a wide selection of geographical and cartographical publications upon which the Division of Maps may draw.

From these rich and varied resources. the Division is prepared to supply cartographical and geographical materials and information to persons visiting the Library, and to answer questions of a geographical nature submitted through correspondence. During the year, the Division serviced approximately 7,000 such requests made by either personal visitors, correspondence, or telephone inquiries.

Catalogue cards, for maps being distributed to depository libraries by the Army Map Service, have been printed and distributed. Catalogue cards for the gazetteers, bulletins, etc., in the same distribution program, are in preparation. In cooperation with the Copyright Office, the Division maintains a catalogue of all copyrighted maps. This catalogue includes all maps presented for copyright from 1897 to date.

The Maps Division continues to cooperate with the Documents Expediting Project in the Library of Congress in the distribution of Army Air Forces aeronautical charts, selected hydrographic charts and the O.S.S. maps that have been released from security classification.

The Library is participating, with other Federal agencies, in a cooperative program for foreign acquisitions and exchanges. As a result of this program 10,000 maps and 30 atlases were added to the Division of Maps collections in 1947.

MAP INFORMATION OFFICE (U. S. GEOLOGICAL SURVEY) (I)

During the year, this Office continued to maintain and augment complete information regarding all published or otherwise available topographic maps, planimetric maps, aerial photography, aerial mosaics or photo maps, geodetic control, and data pertaining to work in progress and new schedules of the various Federal agencies interested in surveying, mapping, and photogrammetry.

The preliminary study of the status and evaluation of topographic mapping in the United States, made during 1946, was completely revised and broadened to include planimetric maps. Copies of this status map and related explanatory text are available upon request.

The second edition of the status of aerial photography in the United States was compiled and published. This issue showed available photography, additional coverage in areas photographed more than once, and new projects under way by Federal agencies and two groups of state and commercial agencies. A second aerial photography index map, showing the coverage of all agencies in Alaska, was published for limited distribution to government agencies only.

A status map showing all available aerial mosaics or photo-maps held by government agencies was completed and published late in the year. Also shown are the scale of the mosaics and the date of compilation. A related explanatory statement was also issued.

This Office now serves as a central clearing point wherein any agencies contemplating new surveying, mapping, or photogrammetric projects can ascertain any other similar existing or contemplated work for the areas of interest, thus fully safeguarding against unnecessary duplication or overlapping of mapping activities.

In addition to the functions mentioned, the preparation of exhibits and press articles concerning topographic mapping, the distribution of control data, and general assistance to educational institutions have been assigned to the Map Information Office. Requests for information from Survey production offices, other Federal and state agencies, the general public, and foreign governments continually increased during the year.

MISSISSIPPI RIVER COMMISSION (N.D.—ARMY)

This Commission is charged with improvement of the lower Mississippi River and tributaries in the Alluvial Valley for flood control and navigation under the direction of the Secretary of the Army and the supervision of the Chief of Engineers. For this purpose it has published and maintains 220 topographic sheets, scale 1:62,500, covering 52,000 square miles of area in Missouri, Illinois, Kentucky, Arkansas, Tennessee, Mississippi, and Louisiana. The Commission also publishes multi-colored wall maps at various scales of the Lower Alluvial Valley of the River. Practically the entire Alluvial Valley has been photographed from the air for this mapping.

During the calendar year 1947, the 15th Edition of the map folio of the lower Mississippi River for navigation purposes was reprinted with corrections. An index to topographic quadrangles of the Alluvial Valley of the lower Mississippi River was brought up to date and republished Jan. 1, 1947. Topographic quadrangle maps were corrected for publication in the future. A folio of navigation maps, scale 1:62,500, was prepared and published for sections of the St. Francis River in Missouri, White River in Arkansas, Yazoo, Tallahatchie, Coldwater, and Big Sunflower Rivers in Mississippi, and the Red River in Arkansas and Louisiana. The folio of navigation maps of the Mississippi River from Cairo to the Gulf was in process of revision for Edition 1948, and similar work was accomplished on the folio of maps of the Intracoastal Waterway from Port Arthur, Tex. to New Orleans, La. Navigation maps are in process of preparation and publication of other navigable streams in the Lower Valley. Surveys were made over areas involved in flood control and navigation projects within the jurisdiction of the Mississippi River Commission. Hydrometrical surveys were made during the year, and the results of those made in 1944 were published in a volume entitled *Stages and Discharges of the Mississippi River and Its Outlets and Tributaries.*

PUBLIC ROADS ADMINISTRATION (FWA)

The mapping activities of the Public Roads Administration are directed toward the compilation of highway maps, of which three series are regularly reproduced for publication and general distribution.

The Transportation Map series, aggregating 441 sheets for the 48 states, is a cooperative undertaking by this agency and the Geological Survey. Highway and other related data are furnished by the Public Roads Administration and compilation and printing is done by the Geological Survey. These maps are published at the scale 1:250,000 and show all highways and county or other connecting roads. Other planimetric data shown include cities, towns, parks, reservations, railroads, airports, canals, drainage, and other related features. Maps of 28 states, aggregating 246 sheets, have been published, and maps for 10 other states, including the District of Columbia, are in process of compilation, drafting, or reproduction. Maps in this series are subject to periodic correction. These maps are widely distributed to libraries, educational institutions, transportation companies, and commercial map publishers, and are available to the general public by purchase from the Superintendent of Documents.

It is planned to publish in 1948 a revised edition of the wall map showing the United States System of Numbered Highways together with the Federal Aid Highway System. This compilation is in the form of a red overprint on the General Land Office base map of the United States, scale approximately 37 miles per inch.

Data for the highway overprint and for correction of Federal Reservation boundaries are prepared by this agency. Photography and printing are done by the Geological Survey.

Another regularly published map is that showing the United States System of Highways according to the latest published descriptions of the American Association of State Highway Officials. This is in the form of a red overprint on the United States map in three colors. This map is very useful as an index and for outlining routes of travel and supplying touring information.

The Public Roads Administration also assists in and encourages statewide highway planning surveys in all of the 48 states. A part of this program includes the preparation of county maps, usually at the scale of 1 or 2 inches per mile, showing a great variety of cultural features and the location and status of improvement of every road. Reproductions of these maps, mostly in the form of blue line prints, are available for purchase from the several state highway departments. Plans are underway to institute a long-range program for the complete revision of these county maps within five year intervals.

In connection with this planning survey, many states have compiled state maps at various scales (usually approximately 8 miles per inch) showing important elements of highway data.

SOIL CONSERVATION SERVICE (A)

This agency prepares and publishes maps showing physical land conditions with particular relation to soil erosion and conservation studies and also prepares mosaics from aerial photographs for field use in the various Soil Conservation Districts.

During the year, 20 aerial photography projects, totaling 35,000 square miles of area, were in progress. Of this total, 25,700 square miles of photographic coverage were completed.

Aerial mosaics covering 2,514 square miles of area in Nevada, New Mexico, California, Idaho, Oregon, Washington, and Utah were completed. For additional mosaics, 24,000 square miles of templet assemblies were laid.

Drafting of a planimetric map of Burke County, Georgia was completed. Compilation and drafting was completed for most of Monmouth County, New Jersey. For this map, physical survey and other planimetric information will be overprinted on a mosaic background. Other drafting and compilation in progress or completed includes Kent County, Maryland, Oneida County, Idaho, Harmon County, Oklahoma, Otoe County, Nebraska, and Montour—Northumberland, Pennsylvania. A part of this work was done for the Bureau of Plant Industry.

SOIL SURVEY (BUREAU OF PLANT INDUSTRY, SOILS, AND AGRICULTURAL ENGINEERING) (A)

The Division of Soil Survey, Bureau of Plant Industry, Soils and Agricultural Engineering, issued during the year 10 detailed soil maps with accompanying explanatory bulletins, bringing the total of such published surveys to 1,560. The new maps and reports were for the following areas: Sullivan County, N. Y.; Union County, Pa.; Fulton County, Ind.; Kings County, Calif.; Bucks County, Pa.; Fannin County, Tex.; Brown County, Ind.; Hamblen County, Tenn.; Humphreys County, Tenn.; and Bedford County, Tenn. Approximately 2,400,000 acres were covered by field surveys during the year by the Division and cooperating state agencies. The results will be published on maps in the regular soil map series.

TENNESSEE VALLEY AUTHORITY

The principal surveying and mapping activities of the Tennessee Valley Authority are those normally concerned with its planning, design, construction, land acquisition and disposition, and operational requirements. During the war, practically all of the Authority's mapping personnel and facilities were engaged in the execution of assignments for the War Department.

After resuming regular schedule work in the previous year, emphasis was again placed on the preparation of standard 7½-minute quadrangle topographic maps of the Tennessee River watershed, a project sharply curtailed during the war years in order to accept military mapping assignments from the War Department. During 1947, production rates were increased and final edition maps were published for approximately 5,000 square miles.

A number of relatively small special assignments of mapping and control survey work was accepted from other government agencies. The majority of them were completed or practically completed during the year.

In the Watauga Reservoir area, some 3,000 acres were surveyed and mapped for the acquisition of land or land rights required for the project. Except for the usual clean-up activities, cadastral surveys were practically completed for the project. Staking of the reservoir clearing contour, approximately 110 miles in length, was completed.

Hydrographic surveys for navigation improvement and charting work in the Pickwick and Wheeler reservoirs included sweeping nearly 900 ranges and sounding high areas disclosed by the sweeping operations.

OTHER AGENCIES

While the agencies mentioned above may be considered the principal surveying, map production, or map research organizations of the government, others which are extensive map users also prepare maps relating to special subjects in their fields of endeavor or otherwise operate in related activities.

The Bureau of the Census compiles special maps for use in census surveys. They are largely of an analytical character and are illustrative of various census reports. The state maps of this agency showing minor civil divisions are in frequent demand. While the Civil Aeronautics Administration does not publish maps for general use, it is intensely interested in and closely connected with the development and production of aeronautical charts for use by civil aviation. It supplies to the chart producing agencies all information of an aeronautical nature that is necessary for the preparation of such charts of the United States and territories. The Bureau of Agricultural Economics prepares statistical maps relating to agricultural production and marketing to accompany detailed reports it issues on those subjects. The Weather Bureau prepares for distribution a daily weather map which is in great demand for a number of uses including air transportation.

The National Park Service procures or prepares maps and surveys for the administration and development of 171 areas under its jurisdiction. Generally, small scale maps are produced on an assignment basis by the Geological Survey. Large scale maps are produced by the Park Service. The Office of Indian Affairs is concerned with maps and aerial photographs for use in administering the various Indian Reservations. The Post Office Department prepares maps showing all postal routes, post offices, and related railroad supply routes. The incessant changes in mail supply and delivery services requires constant revision of the 6,832 maps this agency has in actual use. Many other agencies such as the Fish and Wildlife Service, National Housing Authority, National Archives, Bureau of Foreign and Domestic Commerce, and Rural Electrification Administration are extensive map users and occasionally prepare special compilation of a related nature.

STATE GEOLOGICAL SURVEYS

By Wilson M. Laird
State Geologist of North Dakota

STIMULATED DEVELOPMENT OF NATURAL RESOURCES

In the present time, sometimes known in the vernacular as "The Atomic Age," we find that the natural resources of this and every other country are of extreme importance. Of course, the immediate interest as far as the atomic age is concerned are those minerals which are possibly radio-active. However, all natural resources are important in this, as well as any other age. The United States has been singularly blessed with abundance of natural resources, but the recent war and high post-war demands have not only depleted some of our resources to a marked degree, but are constantly causing inroads on the ones in which we are as yet still relatively sufficient. Therefore, the State Geological Surveys, or their equivalents the State Bureaus of Mines, have increased where possible their investigations and have helped to stimulate the development of natural resources in their respective territories.

As the United States is a large and varied area containing many different geological conditions, no two states have exactly the same natural resources in the same quantities. On one hand some states have abundant resources of coal; others have abundant resources of the metals; still others have abundant resources of oil; many have non-metallic products such as building stone, clays, sodium sulphate and other minerals which are also extremely important. The importance of building materials, such as gravel and sand, should not be overlooked. In fact, the gravel and sand industry surpasses in monetary value some other less prosaic minerals as far as the country as a whole is concerned. The importance of construction materials is extremely marked in areas where abundant deposits of sand and gravel are not readily available and where large construction projects, such as the dams on the Missouri River, are about to take place.

SCOPE AND ACTIVITIES OF STATE SURVEYS

The State Geological Surveys have been for many, many years interested in developing the natural resources in their own area and to this end they have conducted natural resource surveys, have done geologic mapping, and a number of them have done actual development or pilot plant work on the utilization of these natural resources for the benefit of all concerned. These states which have gone so far in the support of their State Geological Surveys are to be highly complimented. Probably the most outstanding example of industrial research for the benefit of the state and industries therein is that being done at the present time in the Illinois Geological Survey.

A number of State Surveys have had a long and illustrious history. In 1948, the 100th anniversary of the Alabama Geological Survey will be celebrated. Several of the Surveys, notably Pennsylvania, New York, as well as several others, are well over 100 years old already and during their life span they have done a tremendous amount of excellent work that has been done by no other agency, either private or public.

FEDERAL AND STATE COOPERATION

As time passes we are learning that there is more and more to be gained by cooperation between the State Geological Surveys and the Federal government agencies, particularly the U. S. Geological Survey. This cooperation varies from financial arrangements, whereby the states furnish half the money and the Federal government furnishes the other half and all of the personnel for the cooperative project, to projects where the state supplies men and the Federal Government supplies men to work together on a project. In all instances these cooperative projects have been of benefit, both to the state and to the Federal Government, and as far as the states are concerned there is a feeling that in most cases they are very well satisfied with the results. The realm of cooperation takes in not only actual geologic studies, but also ground-water work, surface water work and topographic mapping.

At the present time there is a great interest in ground-water work due to the urgency that a number of areas, particularly towns, have felt for the development of adequate water supplies. In the more arid parts of the country the matter of underground water is one of considerable importance, in view of the fact that there is not sufficient surface supply to accommodate the needs for the surrounding territory. Topographic mapping is also of extreme importance, owing to the fact that little can be done in a geologic way without adequate base maps. These maps also are used, not only by State Highway Departments, but also by recreation officials and planning authorities.

In the great central portion of the country in the Missouri River Basin there is at the present time a tremendous development going on under the supervision of both the Army Engineers and the Bureau of Reclamation. These agencies have been calling upon, not only other agencies of the Federal Government, but also the State Geological Surveys for information on the natural resources and related problems in their respective areas. In this respect the State Surveys have been glad to cooperate because it is felt that this development will be of great benefit, not only to the individual states, but to the entire country. In the Missouri Basin area there are planned a large number of dams for flood control and navigation, as well as irrigation. Should all of the proposed areas be irrigated and should all of these dams be constructed, it would be a tremendous boon to the region. In the area affected by these dams, undoubtedly a large number of people who will settle on farms will come into the region. Furthermore, a considerable amount of industry will probably follow because of advantageous location near natural resources, as well as abundant electric power which will be developed from the dams.

TRAINING OF MEN IN SURVEY WORK

Another part that the State Geological Surveys play, and one which is not particularly advertised, is in the training of men not only for the Federal Government but also for private industry and teaching positions. The State Geological Surveys have had on their staffs at one time or another a large number of people who have gone out into the various branches of the geological sciences. This training has been all to the good for the individuals, but it has not been entirely one-sided because the State Geological Surveys have been able to benefit by having young, vigorous men who were on their way up on their staffs and who have contributed a great deal to the good work that has been done by the State Geological Surveys. A number of the Surveys are employing graduate students during the summer months for field work which may be used as the basis for a Master's or Doctor's thesis in some university. In this way the State Geological Survey benefits by getting an area needing geologic work mapped relatively cheaply, and at the same time the student receives the benefit from his work for his thesis problem.

THE FINANCIAL ASPECT

The State Geological Surveys are, of course, totally dependent upon appropriations from their respective state legislatures. It is to be hoped, in view of the large demand for the survey type of geologic work, that the appropriations will be continued on a larger basis in the coming years. This is dependent to a large degree on business conditions and the general tax structure as a whole. In any event, the State Geological Surveys need additional funds for hiring adequately trained men, for equipping well designed and well cared for buildings, and for research purposes. In the minds of most competent observers there has been more received in a monetary way from the work of the Geological Surveys in the respective states than the surveys have ever had appropriated to them. Therefore, it would seem that it would be a very fine business investment if the amount of money spent on State Geological Surveys was increased.

ALABAMA

Organization.—Geological Survey of Alabama, University, Alabama, Dr. Walter B. Jones, State Geologist.

Basic and Economic Geology.—*Projects:* Well logs, Coosa coal field; Brown iron ores of Alabama.

Water Resources.—*Projects:* Natural water losses of Alabama; Ground-water of south Alabama. *Publications:* Ground-Water Investigations in the Mobile Area, Alabama (Bull. 38).

Others.—*Publications:* The Theridiidae or Comb-Footed Spiders of Alabama (Mus. Paper 22).

ARIZONA

Organization.—Arizona Bureau of Mines, Tucson, Arizona, Dr. T. G. Chapman, Director.

Basic and Economic Geology.—*Projects:* Relation of structure to mineralization in central Arizona; Arizona minerals; Cooperation with State Land Department; Zinc and lead deposits of Arizona; Barite; Perlite, Engine sand; Light-weight aggregates. *Publications:* Minerals of Arizona (Bull. 153).

Others.—*Projects:* Spectrographic studies of contact deposits; History and statistics of Arizona mining. *Publications:* History of Mining in Pima County, Arizona; Progress and Trends in Mineral Dressing.

ARKANSAS

Organization.—Division of Geology, Arkansas Resources and Development Commission, Little Rock, Arkansas, Harold B. Foxhall, Director.

Basic and Economic Geology.—*Projects:* Study of significant wildcat wells in eastern Arkansas; Cooperative project with the Coal Division, U. S. Bureau of Mines in sampling Arkansas lignite deposits; Lignite to be tested for Montan wax content; Mapping and sampling of a molybdenite deposit in the Magnet Cove area; Mapping and study of the rutile deposits in the Magnet Cove area; Supervision of exploration project on a north Arkansas phosphate deposit; Sampling and ceramic testing of the Wilcox clays of the Gulf Coastal Plain in Arkansas. *Publications:* Brookite Deposit in Hot Spring County, Arkansas (Bull. 11).

Water Resources. — *Projects:* Stream gaging at 46 stations.

Topographic and Planimetric Mapping.—*Projects:* Cooperative topographic mapping with the U.S. G.S. of the Malvern Quadrangle.

Others.—*Projects:* Compilation of annual mineral production statistics for the state.

CALIFORNIA

Organization.—Division of Mines, Department of Natural Resources, San Francisco 11, California, Dr. Olaf P. Jenkins, Chief.

Basic and Economic Geology.—*Projects:* Tesla, Blue Lake, Lake Elsinore, Hollister, Copperopolis, St. Helena, Nipomo and Quien Sabe quadrangles; Mines and mineral resources of Napa County; California mineral production and directory of producers; Statistical bulletin; Guide book to Sierra Nevada; Tungsten Hills district; San Diego pegmatites; West Point tunnel. *Publications:* *California Journal of Mines and Geology*, Vol. 43, for January, April, July and October, 1947; Consolidated

Index of Publications, Division of Mines and State Mining Bureau (Bull. 131); Minerals of California (Bull. 136); California Mineral Production and Directory of Mineral Producers for 1945 (Bull. 137); Iron Resources of California (Bull. 129); Geological Investigations of Chromite in California (Bull. 134); Placer Mining for Gold in California (Bull. 135); Copper Resources of California (in press).

COLORADO

Organization.—Colorado Geological Survey, Denver, Colorado, Dr. Ben H. Parker, State Geologist.

Basic and Economic Geology.—*Projects:* Cooperative work with the U.S.G.S. on the geology and mineral resources of Cripple Creek, San Juan, Kokomo, Ophir, Leadville-Minturn-Redcliff areas.

CONNECTICUT

Organization.—Connecticut Geological and Natural History Survey, Hartford 6, Connecticut, Dr. Edward L. Troxell, Director.

Basic and Economic Geology.—*Projects:* Two geologic studies in eastern Connecticut; Geologic study near Preston, Connecticut; Geologic study near Hammond Beach area; Study of Mollusks. *Publications:* Asilidae—the Robber Flies (Bull. 69); Spiders of Connecticut (Bull. 70).

Others.—*Publications:* Biennial Report.

FLORIDA

Organization.—Florida Geological Survey, Tallahassee, Florida, Herman Gunter, Director.

Basic and Economic Geology.—*Projects:* Micropaleontology; Geology and structure of Levy and Citrus Counties; Geology and structure of Jackson County; Correlation of well data; Prospecting for rare earths in cooperation with U. S. Bureau of Mines; General review of mineral resources in Florida; Preparation of mineral producers directory; Periodic investigation of fine character of basic clays and dolomites; Investigations of light weight aggregate and materials for making rock wool.

Water Resources.—*Projects:* Continuous cooperation with U.S.G.S. in ground water studies; Surface water studies, especially springs and lakes; Quality of water studies. *Publications:* Water Levels and Artesian Pressure in Wells in Southeastern States, Springs of Florida (Bull. 31).

Others.—*Projects:* Continued cooperation with University of Florida Engineering and Industrial Experiment Station, in prospecting clays. *Publications:* Elevations in Florida (Bull. 32); Seventh Biennial Report, Florida Geological Survey; Springs of Florida (map).

GEORGIA

Organization. — Department of Mines, Mining and Geology, 425 State Capitol, Atlanta, Georgia, Garland Peyton, Director.

Basic and Economic Geology.—*Projects:* Geology and mineral resources of Rabun, Towns and Habersham counties; Investigation of mica in mica schists to determine its suitability for use in grinding mica; Investigation of vermiculite deposits in Georgia; Investigation and exploration of amphibole asbestos deposits; Investigation of sericite phyllites in Georgia; Investigation of pegmatitic type deposits as a source of grinding mica; Investigation of kaolin and other mineral resources of central east Georgia. *Publications:* Directory of Mineral Producers; List of Publications on Geology and Mineral Resources of Georgia (Circular 1); Geology and Mineral Resources of the Paleozoic Area of Northwest Georgia in cooperation with T.V.A. (in press); Geologic map of northwest Georgia in cooperation with T.V.A., scale four miles to one inch.

Water Resources.—*Projects:* Hydrologic studies of limestone terranes in Baker and Mitchell counties in cooperation with the U.S.G.S. and Emory University; A study of salt water encroachment in the Savannah area, in cooperation with U.S.G.S.; Geology and ground water resources of the Paleozoic area, in cooperation with U.S.G.S.; Geology and ground water resources of eight counties in the Atlanta area, in cooperation with U.S.G.S.

Topographic and Planimetric Mapping.—*Projects:* Map of the mines, quarries and prospects in the Paleozoic area of northwest Georgia in cooperation with T.V.A.

IDAHO

Organization.—Idaho Bureau of Mines and Geology, Moscow, Idaho, A. W. Fahrenwald, Director.

Basic and Economic Geology.—*Projects:* Black Sand (monazite) resources surveys; Geological survey and mapping of the Yankee Fork area, Custer County; Geological mapping of the Little Lost River Mountain area, Butte County; Resources study of Diatomite; Beneficiation and processing of Idaho phosphate rock. *Publications:* A Geological Reconnaissance of the Hailey Gold Belt, Blaine County, Idaho (Pamph. 76); Beneficiation Tests on Gypsum Rock from Washington County, Idaho (Pamph. 77); Metallurgical Tests on the Manganese Bearing Sands of Payette County, Idaho (Pamph. 78); Beneficiation of Idaho Phosphate Rock (Mineral Resources Report No. 3); Diatomite Deposits of Southwestern Idaho (Mineral Resources Report No. 4).

ILLINOIS

Organization. — State Geological Survey Division, State Department of Registration and Education, Urbana, Illinois, Dr. M. M. Leighton, Chief.

Basic and Economic Geology.—*Projects:* Areal investigations and geologic mapping; Engineering geology reports on highway conditions, damsites, etc.; Pennsylvanian stratigraphy; Mississippian stratigraphy; Silurian stratigraphy; Cambro-Ordovician stratigraphy; Pleistocene system; Micropaleontological studies; Paleobotany of the Pennsylvanian; Geology and oil and gas resources of the Illinois basin; Secondary recovery of oil in Illinois; Studies of reservoir conditions in Illinois oil pools; Scouting of drilling wells and cooperation with Illinois Scout Check; Mapping and study of Illinois coal resources; Lithological and botanical constitution of Illinois coals; Studies to determine the usefulness of coal spores as index fossils; Briquetting of Illinois coal without binder; Investigation of combustion behavior of Illinois coal to develop improved stoker fuels; Investigation of suitability of low-sulfur Illinois coals for use in production of metallurgical coke; Chemical study of tars prepared from Illinois coals in commercial and pilot plant coking operations; The chemical constitution of Illinois coals; Proximate and ultimate analyses of Illinois coals; Geologic study of mine roof conditions; Fluorspar resources of southern Illinois; Utilization of fluorspar; Clay resources of Illinois; Petrology of Illinois clays; Special uses for Illinois clays and shales; Application of clay mineralogy to problems of the origin, discovery and production of oil; Clay mineralogy as related to soil materials and engineering problems; Limestone resources of Illinois; Sand and gravel resources of Illinois; Investigation of the physical properties of Illinois silicas; Viscosity of silicate melts. *Publications:* Pennsylvanian Ostracodes in Illinois (Bull. 70); Preglacial Erosion Surfaces in Illinois (R.I. 118); Upper Kincaid (Mississippian) Microfauna from Johnson County, Illinois (R.I. 122); King Oil Field, Jefferson County, Illinois (R.I. 119); Developments in Eastern Interior Basin in 1945 (I.P. 53); Oil and Gas Development in Illinois in 1945 (I.P. 54); Flood Tide in Illinois (Cir. 125); Correlation of Domestic Stoker Combustion with Laboratory Tests and Types of Fuels, II. Combustion Tests and Preparation Studies of Representative Illinois Coals (R.I. 120); Coke—A Key Industrial Material (Cir. 127); Trends in Coal Utilization (Cir. 128); Southern Illinois Novaculite and Novaculite Gravel for Making Silica Refractories (R.I. 117); Agstone Used in Illinois in 1945 (Cir. 123).

Water Resources. — *Projects:* Ground-water geology of industrial, urban and special areas; Electrical earth resistivity surveys for subsurface water-bearing sand and gravel deposits; Geophysical logging of water wells; Cooperation with Illinois Water Well Drillers Association.

Topographic and Planimetric Mapping.—*Projects:* Alton, Augusta, Buckley, Camp Grant, Camp Point, Chatham, Columbia, Crete, Cullom, Davenport, Dunlap, Fairfield, Hillsboro, Joliet, Kansas, Kimmswick, Leroy, Mendon, Milan, Morrisonville, Muscatine, Olney, Pana, Paris, Peoria, Peotone, Prairie Home, Rockford, St. Charles, Spring Bay, Stewardson, Strawn, Wapello, Waterloo and Woosung quadrangles. *Publications:* Gilman and Ramsey Quadrangles.

Others.—*Projects:* Economic review of mineral industries; Long-term manufacturing opportunities in Illinois; Handbook of fuels data—with special reference to fuel consumption in the Illinois coal market area; Studies of Southern Illinois economic problems; Investigation of the transmission of radio waves through rock strata. *Publications:* Geologic Map of Illinois; Soil Survey maps; Illinois Mineral Industry in 1945 (R.I. 121); *What About Our Minerals?* A Quiz Book on the Geology and Mineral Resources of Illinois (Cir. 124); Operation of the Illinois State Geological Survey (Cir. 126).

INDIANA

Organization.—Division of Geology, Indiana Department of Conservation, Bloomington, Indiana, Dr. Charles Deiss, State Geologist.

Basic and Economic Geology.—*Projects:* Completed flights totaling 20,000 square miles for airborne magnetometer survey of Indiana; Completed directory of mineral producers in Indiana; Microscopic studies of the Silurian and Devonian formations along the Cincinnati arch; Geologic and mineral resources of Jasonville quadrangle; Resurvey of coal lands of Indiana; Completed examination and sampling of 85 commercial limestone and shale deposits in Indiana. *Publications:* Silurian and Devonian Rocks of Southeastern Indiana; Wyandotte Cave.

Water Resources.—*Projects:* Cooperative program with the U.S.G.S.

Topographic and Planimetric Mapping. — *Projects:* Cooperation with the U.S.G.S.

Others.—*Publications:* Oil and Gas Developments in Illinois and Indiana in 1946; Data on Indiana in F. H. Lahee Report on Exploratory Drilling in 1946.

IOWA

Organization. — Iowa Geological Survey, Iowa City, Iowa, Dr. H. Garland Hershey, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Pleistocene history of Mississippi River; Stratigraphy of Upper Des Moines Series; Geology of Floyd County; Geology of Shelby County; Subsurface geology of Cambrian strata of Iowa; Revision of Kinderhook strata of Iowa; Bibliography of geology of Iowa; Subsurface geology of the Osage and Kinderhook Series in southeastern Iowa; Subsurface geology of Ordovician strata in Iowa; The Neda zone in Iowa; Summary of agricultural limestone resources in south-central Iowa; Mineral production reports.

Water Resources. — *Projects:* Ground-water resources of Cerro Gordo County; Geology and groundwater resources of Webster County; Geology and ground-water resources of Cedar Rapids and vicinity; Mineral analysis of underground waters of Iowa; Surface water resources of Iowa.

Others.—*Publications:* Mineral Resources Map of Iowa.

KANSAS

Organization. — State Geological Survey of Kansas, Lawrence, Kansas, Dr. Raymond C. Moore, Director of Research and State Geologist, Dr. John C. Frye, Executive Director.

Basic and Economic Geology.—*Projects:* Geology and oil and gas resources of Crawford County; Collection of mineral statistics in cooperation with U. S. Bureau of Mines; New mineral resources map of Kansas; Geologic cross sections in eastern Kansas; General stratigraphic and lithologic studies in eastern Kansas; Chemical analyses of Kansas rocks and minerals; Oil and gas resources of Bourbon County, Neosho County, Miami County and Chautauqua County; Oil and gas developments in western Kansas during 1947; Oil and gas developments in eastern Kansas; Structural development of the Salina Basin; Subsurface rocks of Upper Cambrian and Lower Ordovician age in Kansas; Investigation of oil shales in Kansas; Collection of well samples, cores, and logs; Subsurface stratigraphy along the west flank of the Central Kansas Uplift; Lignite resources of the Dakota formation of Cretaceous age in North Central Kansas; Chemical study of coals from the southeast Kansas coal fields; Geophysical investigations in the Kansas part of the Tri-State zinc and lead field; Experimental development of lightweight aggregates from clay, shale, loess, and volcanic ash; Field and laboratory study of anhydrite-gypsum relationships; Molding sand resources of Kansas; A study of flint gravel deposits in eastern Kansas; Industrial uses of "ceramic slag"; Petrographic and chemical study bearing on the usefulness of Kansas chalk deposits; Special tests and study of clays near Great Bend, Norton, and other communities for proposed brick and tile plants. *Publications:* Coal Resources of the Wabaunsee Group in Eastern Kansas (Bull. 63); Cretaceous Stratigraphy of the Belvidere Area, Kiowa County, Kansas (Bull. 64, part 6); Clays of the Dakota Formation in Kansas (Bull. 67); Exploration for Oil and Gas in Western Kansas During 1946 (Bull. 68); Coal Reserves in Kansas (Bull. 70, part 1); Magnetic Survey of the Bala Intrusive, Riley County, Kansas (Bull. 70, part 2); The Late Pleistocene Loesses of Central Kansas (Bull. 70, part 3); Cemented Sandstones in the Dakota and Kiowa Formations, Kansas (Bull. 70, part 4); Magnetic Survey of Southeastern Crawford County, Kansas (Bull. 70, part 5); Oil and Gas Investigations, Preliminary Cross Section No. 3, Subsurface Geologic Cross Section from Ford County, Kansas to Dallam County, Texas; Oil and Gas Investigations, Preliminary Cross Section No. 4; Subsurface Geologic Cross Section from Scott County, Kansas to Otero County, Colorado; Oil and Gas Investigations, Preliminary Cross Section No. 5; Subsurface Geologic Cross Section from Trego County, Kansas to Cheyenne County, Colorado.

Water Resources.—*Projects:* Geology and ground-water resources of the "Equus beds" area; Geology and ground-water resources of Pawnee and Edwards counties; Geology and ground-water resources of Jewell county; Ground-water resources of the Kansas City industrial area; Ground-water resources of the lower Arkansas valley; Ground-water resources in the Smoky Hill Valley from Lindsborg to Junction City; Deep-water supplies of southeastern Kansas; Geology and ground-water resources of the following counties: Stafford, Barton, Norton, Republic and northern Cloud, Rice, Pawnee Valley; Geology and ground-water resources along the north fork of Solomon River; Geology and ground-water resources of Wichita and Greeley counties; Observation-well program involving water level measurements in approximately 450 wells. *Publications:* Geology and Ground-water Resources of Kiowa County, Kansas (Bull. 65); Geology and Ground-water Resources of Scott County, Kansas (Bull. 66); Geology and Ground-water Resources of Seward County, Kansas (Bull. 69).

Topographic and Planimetric Mapping.—*Publications:* Oswego and Parsons Quadrangles.

KENTUCKY

Organization.—State Department of Mines and Minerals, Lexington, Kentucky, Daniel J. Jones, State Geologist.

Basic and Economic Geology.—*Publications:* Relation of Sand Deposits at Tip Top, Kentucky, to the Meramec-Chester Boundary; Map showing Knox Dolomite Tests.

LOUISIANA

Organization.—Louisiana Geological Survey, Baton Rouge, Louisiana, Leo W. Hough, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of Red River, De Soto, Webster, Allen and Beauregard Parishes; Reserve estimates; Basic and recalculations on oil and gas; Investigation of ceramic possibilities of clay resources of the State. *Publications:* Geology of Red River and De Soto Parishes.

Water Resources.—*Projects:* Special investigations in specific problem areas. *Publications:* Ground Water Resources in the Monroe Area, Louisiana.

Others.—*Publications:* Oil and Gas Map of Louisiana, Revised 1947 edition.

MAINE

Organization.—Maine Geological Survey, Orono, Maine, Dr. Joseph M. Trefethen, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of part of coastline; Limestone; Diatomaceous earth; Feldspar; Serpentine. *Publications:* Manganese deposits of Aroostook County, Maine (Bull. 4); Report of State Geologist, 1945-46.

MARYLAND

Organization.—Department of Geology, Mines and Water Resources, Baltimore 18, Maryland, Dr. Joseph T. Singewald, Jr., Director.

Basic and Economic Geology.—*Projects:* Geologic mapping of Montgomery, Charles and Washington counties; Subsurface geology of eastern shore; Logging cores of U. S. Bureau of Mines drilling Georges Creek Basin; Fire clays of western Maryland. *Publications:* Carroll and Frederick Counties Report.

Water Resources. — *Projects:* Ground-water resources of Baltimore industrial area; Ground-water resources of southern Maryland; Conversion of remaining non-recording to recording gaging stations.

Topographic and Planimetric Mapping. — *Projects:* Topographic mapping of Garrett County; Revision of topographic maps of Kent and Montgomery counties. *Publications:* Prince George's County.

MICHIGAN

Organization.—Geological Survey Division, Department of Conservation, Lansing, Michigan, Gerald E. Eddy, State Geologist.

Basic and Economic Geology.—*Projects:* Limestones of southeastern Michigan; Niagaran formation; The Pleistocene; Public education in geology through lectures and magazine activities; Silurian and Ordovician; Stratigraphic research in petroliferous formations; Study of geology of Iron County; Study of geology of Dickinson County; Study of geology of western Marquette Range. *Publications:* Occasional Papers for 1946 on the Geology of Michigan.

Water Resources. — *Projects:* Study of water wells of the state; Study of water supply problems—Houghton-Hancock, Bessemer, Wakefield, Escanaba; Ground water fluctuations in north-central Michigan; Lake level problems. *Publications:* Ground-Water Resources of Alma Area; Ground-Water Resources of Battle Creek; Well Logs and Bedrock Geology of Gratiot County, Genesee County, Calhoun County, Kalamazoo County, Oakland County.

Others.—*Publications:* Pleistocene Geological Map of the Southern Peninsula; Annual Survey and Valuation of Iron and Copper for the State Tax Commission.

MINNESOTA

Organization.—Minnesota Geological Survey, Minneapolis, Minnesota. Dr. George M. Swartz, Director.

Basic and Economic Geology.—*Projects:* Geology of Cook County;

Glacial geology of Cook County; Geology of the Duluth area; Revision of stratigraphy of Cambrian and Ordovician; Revision of geology of the Cuyuna Range; Magnetics of north central Minnesota; Restudy of the clays and shales of Minnesota. *Publications:* The geology and Underground Waters of Northeastern Minnesota, Minnesota Geological Survey (Bull. 32).

MISSISSIPPI

Organization.—Mississippi State Geological Survey, University, Mississippi, Dr. William C. Morse, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Three projects in general geology; Two projects in nonmetallic minerals. *Publications:* Itawamba County Mineral Resources (Bull. 64).

Water Resources. — *Projects:* Four projects. *Publications:* Geology and Artesian Water of the Alluvial Plain in Northwestern Mississippi (Bull. 65).

MISSOURI

Organization. — Department of Business and Administration Division, Geological Survey and Water Resources, Rolla, Missouri, Dr. Edward L. Clark, State Geologist.

Basic and Economic Geology.—*Projects:* Pennsylvanian correlations; Pleistocene of Missouri; Geologic mapping of local areas; Berryman Quadrangle; Steelville Quadrangle; Hermitage Quadrangle; Igneous rocks of Missouri; Osage Basin studies; Geology of St. Louis County; Reclassifying coals of Missouri as to age; Studies in southeastern Missouri lead belt and adjoining counties; Structure southwest Missouri zinc and lead district; Geophysical work Annapolis and Palmer areas; Miscellaneous mineral property examinations and studies; Inventory of Missouri clays; Limestone quarry investigation; Dolomite quarry investigation and agricultural lime; Limestone in St. Genevieve County; Limestone in St. Louis. *Publications:* Post-Devonian Igneous Activity in Southeast Missouri (R.I. No. 5); Limestone and Dolomites in St. Louis County (R.I. No. 5).

Water Resources.—*Projects:* Gaging of eighty-seven stations, pump tests and acidizing recommendations deep wells; Examination of well cuttings; Ground-water at Lake City, Missouri. *Publications:* Ground-water in Agriculture (I.C. No. 2).

Topographic and Planimetric Mapping. — *Projects:* Continuous mapping of twelve quadrangles. *Publications:* Mt. Aure, Corridon, Sinkin, Blythedale, Missouri City, Birchtree, Grandin, Green Ridge, Glascow, Lamoni and Chula.

Others.—*Publications:* Index Topographic Map; Dedication of Buehler Building (I.C. No. 1); Biennial Report of State Geologist, 1947.

MONTANA

Organization. — Montana State Bureau of Mines and Geology, Butte, Montana, Dr. Francis A. Thomson, Director.

Basic and Economic Geology.—*Projects:* Continuation of State geologic mapping; Study of deeper horizons as possible sources for petroleum; Geology and ore deposits of the Highland mining district; Study of the placer-gold deposits of Montana; Pegmatites of Madison County; Survey of nonmetallic mineral deposits of Montana; Preliminary survey of sodium sulphate deposits of Montana. *Publications:* Geology and Ore Deposits of Hecla Mining District, Montana; Dickite-Clay Deposits of Fergus County, Montana (Miscl. Cont. No. 9); Distribution of Sedimentary Rocks in Montana and the Northwestern Great Plains (Miscl. Cont. No. 8); Stratigraphic Sections of Upper Paleozoic and Mesozoic Rocks in South-Central Montana.

Water Resources.—*Projects:* Continuation of general ground-water studies.

Others.—*Projects:* Study of mining problems of small mine operators and prospectors; Mineral dressing studies for the beneficiation of Montana ores and nonmetallic minerals. *Publica-*

tions: Metallic Mineral Deposits of Montana (published in cooperation with the U.S.G.S.).

NEBRASKA

Organization.—Conservation and Survey Division, University of Nebraska, Lincoln, Nebraska, Dr. G. E. Condra, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Surface and subsurface stratigraphic studies; Bryozoan studies; Pleistocene stratigraphic studies; Subsurface studies; Oil field studies; Coal deposits stratigraphic study; Mineral resource studies. *Publications:* The Iowan Till in Northeast Nebraska; Two reports on Bryozoa.

Water Resources. — *Projects:* Central and South-central Nebraska counties. *Publications:* Preliminary County Ground-Water Reports (6).

Others.—*Projects:* Soil inspection and correlation work; Conservation and industrial surveys; Soil resurvey Saunders County. *Publications:* Otoe and Lancaster Company Soil Maps; Pre-Pleistocene Map of South-central Nebraska.

NEVADA

Organization.—Nevada State Bureau of Mines, Reno, Nevada, Jay A. Carpenter, Director.

Basic and Economic Geology.—*Projects:* Areal photography and mapping of the area between Ely and Eureka close to the neighborhood of the old famous mining district of Hamilton.

NEW HAMPSHIRE

Organization.—Mineral Resources Committee, New Hampshire State Planning and Development Commission, Durham, New Hampshire, T. R. Meyers, Geologist.

Basic and Economic Geology.—*Projects:* Preparation of report on the surficial geology of New Hampshire; Investigation of alumina-bearing mineral deposits of New Hampshire. *Publications:* Mineralogy of New Hampshire Sands; Till Deposits of New Hampshire.

Water Resources. — *Projects:* Continuation of ground-water studies.

NEW JERSEY

Organization.—Bureau of Geology and Topography, Trenton, New Jersey, Meredith E. Johnson, State Geologist.

Basic and Economic Geology.—*Projects:* Recording of new data on the geology and mineral resources; Investigation of ore genesis and structural relations as exposed in operating mines; Cooperation with Bureau of Mineral Research, Rutgers University, in investigations of industrial sands.

Water Resources. — *Projects:* Study of the ground-water situation in Newark and Harrison; Collection of information on the ground-water resources of the state.

Topographic and Planimetric Mapping.—*Projects:* Sheets 22, 23 and 24 of Topographic Atlas; Geodetic control system. *Publications:* Topographic Atlas Sheets 21, 22 and 23.

NEW MEXICO

Organization.—New Mexico Bureau of Mines and Mineral Resources, Socorro, New Mexico, E. Carter Anderson, Director.

Basic and Economic Geology.—*Projects:* Geology of the Sangre de Cristo Mountain region; Geology of the Sacramento Mountain region; Investigation of oil field corrosion problems; Secondary recovery problems in the oil fields; Engineering and production data in the oil field; Mineral resources of Colfax and Taos counties; Examination of clay deposits. *Publications:* Geology of the Grand Quivira Quadrangle (Bull. 26); Contributions of New Mexico's Mineral Industry to World War II (Bull. 27); Pumice Aggregate in New Mexico—Its Uses and Potentialities (Bull. 28); Compilation of State Tax Law Relating to Mineral Properties in New Mexico (Circ. 13); Oil and Gas Production Data, Eddy County, New Mexico (Circ. 14); Tables of Fluorescent and Radioactive Minerals (Circ. 15); New Mexico Oil and Gas

Production Data for 1946 (Exclusive of Lea County. Circ. 16).

Water Resources. — *Projects:* Ground water resources of Colfax County, San Miguel County and Eddy County.

Others.—*Projects:* Tables of fluorescent and radioactive minerals and their behavior under various lights; Compilation of state laws relating to mineral properties in New Mexico; Annual reports. *Publications:* Annual Report for the Fiscal Year, July 1, 1945 to June 30, 1946; Annual Report for the Fiscal Year, July 1, 1946 to June 30, 1947.

NEW YORK

Organization.—New York State Science Service, Office of the State Geologist, Albany, New York, Dr. John G. Broughton, Acting State Geologist.

Basic and Economic Geology.—*Projects:* Structural geology of Otsego County; Branch office established at Wellsville, New York; Collecting well data and carrying on geophysical and geological research; Magnetic survey of Adirondack region; Economic geology of Niagara dolomites. *Publications:* The Clinton of Western and Central New York (Bull. 341); Cayugoceras, an Upper Silurian Cephalopod; Holochoanites are Endoceroids; New Ordovician Nautiloids from New York; Iron Mining Comes of Age in New York State.

NORTH CAROLINA

Organization.—Mineral Resources Division, North Carolina Department of Conservation and Development, Raleigh, North Carolina, Dr. Jasper L. Stuckey, State Geologist.

Basic and Economic Geology.—*Projects:* Review of mineral industry 1936-1945; Oil possibilities; Coastal Plain of North Carolina; Exploration Deep River Coal Field; Light-weight aggregate resources of North Carolina; Pegmatite resources, Bryson City area, North Carolina; Talc deposits of North Carolina; Scrap mica resources of North Carolina; Barite deposits of North Carolina. *Publications:* The Geology and Mineral Resources of Guilford County (I.C. No. 6).

Water Resources. — *Projects:* Ground-water survey of North Carolina. *Publications:* Ground-water in the Neuse River Basin (I.C. No. 5); A Possible New Source of Groundwater Supply in the Elizabeth City Area, North Carolina.

NORTH DAKOTA

Organization.—North Dakota Geological Survey, Grand Forks, North Dakota, Dr. Wilson M. Laird, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of the Tokio Quadrangle; Eocene of North Dakota; Study of well samples; Lignite compilation; Sodium sulphate deposits; Cement rock and limestone investigation. *Publications:* Geology of the Flora Quadrangle (Bull. 22).

Water Resources. — *Projects:* Ground-water studies at Wimbledon, New Rockford, Zeeland, Cavalier, Sharon, Aneta, Hope, Portland, Minot, Mohall, Flaxton, Michigan, Kindred, Wyndmere and Litchville, North Dakota; Observation well studies; Cooperation with Missouri Basin ground-water studies. *Publications:* Ground-water Near Buxton; Ground-water of Fargo-Moorhead Area; Ground-water in Deposits of Ancient Lake Dakota, Dickey County, North Dakota.

OHIO

Organization.—Geological Survey of Ohio, Columbus 10, Ohio, John H. Melvin, State Geologist.

Basic and Economic Geology.—*Projects:* Monongahela formation; Coshocton County; Perry County; Lucas County; Holmes County; Athens County; Hocking County; Collecting well logs; Examination of cuttings; Washing and filing cuttings; Mapping; Mapping coal outcrops; Limestones of eastern Ohio; Sharon conglomerate; Mapping mineral industries. *Publications:* Geologic Interpretation of Scenic Features in Ohio (Reprint 3); Generalized Section of Rocks in Ohio (I.C. No. 4); Waynesburg Coal in Harrison and Northern Belmont Counties, Ohio, and Revision of Dunkard (Permian) Boundary (R.I. No. 1); Geologic Section of Chillicothe Test Core (R.I. No. 2); Ohio's Place in Mineral Industry in 1945; Limestones of Eastern Ohio; Sharon Conglomerate.

Others.—*Publications:* Reprinting of Geologic Map of Ohio; Mineral Industry Map of Ohio; Geologic Map of Holmes County; Maps showing outcrop and extent of Meigs Creek coal in Cumberland and Caldwell Quadrangles, accompanied by section.

OKLAHOMA

Organization.—Oklahoma Geological Survey, Norman, Oklahoma, Robert H. Dott, Director.

Basic and Economic Geology.—*Projects:* Revision of state geologic map; Geology and mineral resources, Tulsa County; Stratigraphy and areal geology of Arbuckle group; Cambro-Ordovician Arbuckle Mountains, south-central Oklahoma; Subsurface structure map of state; Manuscript on Haskell County; Manuscript on northern LeFlore County; Black sands (titaniferous magnetite) of Wichita Mountains; Royer dolomite—mapping central Arbuckle Mountains; Floating properties—volcanic-ash; Clays. *Publications:* Morrow series (Bull. 66).

Water Resources. — *Projects:* Beaver, Grady, Ottawa counties; Observation well program; Miscellaneous pumping tests and service calls.

OREGON

Organization.—Oregon State Department of Geology and Mineral Industries, Portland, Oregon, F. W. Libbey, Administrator.

Basic and Economic Geology.—*Projects:* Geologic map of Dallas and Valsetz quadrangles; Micro-fossil study of Tertiary formations; Study of nickel-bearing laterites in southwestern Oregon; Investigation of saline deposits in Lake County; Study of common brick clays. *Publications:* Mines and Prospects of the Mt. Reuben District, Josephine County (Bull. 34); Sodium Salts of Lake County, Oregon (GMI Short Paper 17); Bibliography of Geology and Mineral Resources of Oregon (Bull. 33).

Water Resources. — *Projects:* Collection of water-well data in northeastern Oregon.

Others.—*Projects:* Study of samples for radio-activity.

PENNSYLVANIA

Organization.—Bureau of Topographic and Geologic Survey, Harrisburg, Pennsylvania, Stanley H. Cathcart, Director.

Basic and Economic Geology.—*Projects:* Stratigraphy of the Cambrian, Ordovician, and Silurian systems exposed in central Pennsylvania; Geology of Bucks County; Aerial geology of the Philadelphia district; Guidebook to the geology in the vicinity of Philadelphia; Guidebook to geology along the Pennsylvania Turnpike, with supplements on tunnel geology and ground-water; Geology of southeastern Clearfield County; Subsurface stratigraphy of western Pennsylvania; The Butler Quadrangle; The Smethport Quadrangle; The Haskell Sand, McKean County; The McDonald Pool; Areal geology of New Florence Quadrangle; Iron-manganese ores of South Mountain; High-alumina clays of Cameron and Clinton counties. *Publications:* Manganese Minerals of Pennsylvania (Bull. M27); Oil and Gas Developments in the North Strabane Area (Bull. M28); Haskell Sand Core from the Coryville Pool, McKean County (P.R. 131); Geology and Mineral Resources of the Smicksburg Quadrangle (A-55).

Water Resources. — *Projects:* Detailed study of the Philadelphia District; Detailed study of the Pittsburgh District.

Topographic and Planimetric Mapping. — *Projects:* Norristown, Germantown, Colegrove, Emporium, Short Run, Galeton quadrangles. *Publications:* Glen Richey, Ramey, Wallaceton, Houtzdale, Cameron, Driftwood, First Fork, Sinnemahoning, Sky Top, East Stroudsburg, Bushkill, Twelve Mile Pond, Bitumen and Hyner Quadrangles.

Others. — *Publications:* Undrilled area map of Warren Quadrangle; Undrilled area map of southern Kinzua and northern Kane Quadrangles; Farm Line maps of the Butler Quadrangle.

RHODE ISLAND

Organization.—Rhode Island Industrial Commission, Mineral Resources Committee, Providence, Rhode Island, Dr. Alonzo Quinn, Chairman.

Basic and Economic Geology.—*Projects:* Bedrock geology of North Scituate Quadrangle; Surficial geology of North Scituate Quadrangle.

Water Resources. — *Projects:* Ground-water of Pawtucket Quadrangle; Ground-water of Georgiaville Quadrangle.

SOUTH CAROLINA

Organization. — State Geological Survey, Columbia, South Carolina, Dr. Lawrence L. Smith, State Geologist.

SOUTH DAKOTA

Organization.—South Dakota State Geological Survey, Vermillion, South Dakota, Dr. E. P. Rothrock, State Geologist.

Basic and Economic Geology.—*Projects:* Structure in Fall River County: Structure in Haakon County; Granite appraisal; Quartzite appraisal.

Water Resources. — *Projects:* Water level fluctuations in eastern South Dakota. *Publications:* Ground-water resources of the Sioux Falls area (R.I. 56); Ground-water fluctuations in eastern South Dakota (R.I. 59).

Others.—*Publications:* Nonmetallic Economic Products in South Dakota.

TENNESSEE

Organization.—Tennessee Division of Geology, Nashville, Tennessee, H. B. Burwell, State Geologist.

Basic and Economic Geology.—*Projects:* Geologic mapping of Great Smoky Mount in National Park area; Geologic mapping in west Tennessee; Stratigraphic and structural mapping of complex structure in east Tennessee; Subsurface stratigraphy and structure throughout Tennessee; Coal study with attendant detailed mapping; Mapping phosphate reserves. *Publications:* Barite, Fluorite, Galena, Sphalerite, Veins of Central Tennessee (Bull. 51); Geology of Nashville (Bull. 53); Geology and Mineral Deposits of Bumpass Cove, Unicoi and Washington Counties, Tennessee (Bull. 54); Pre-Chattanooga Stratigraphy in Central Tennessee (Bull. 55); Geology of the Carters Creek and Godwin Quadrangles; Subsurface Stratigraphy of Pickett and Northern Fentress Counties, Tennessee.

Water Resources. — *Projects:* Stream gaging in cooperation with U.S.G.S.; Ground-water study in cooperation with the U.S.G.S.

TEXAS

Organization. — Bureau of Economic Geology of the University of Texas, Austin, Texas, Dr. John T. Lonsdale, Director.

Basic and Economic Geology.—*Projects:* Geology of the Christmas Mountains; Catalog of Cretaceous Foraminifera; Geologic surveys in Trans-Pecos Texas; Pleistocene deposits of High Plains; Carboniferous rocks of the Llano region; Ellenburger group in central Texas; Iron ore in the Llano region, central Texas; Mineral resources of the Trinity River tributary area; High grade clay in the Cisco group, north Texas; High grade clay in east Texas; Glass and industrial sands in north Texas. *Publications:* Building Stones of Central Texas (Pub. 4246); The Ellenburger Group of Central Texas (Pub. 4621); Geological Resources of the Trinity River Tributary Area in Texas and Oklahoma; Iron Ore in the Llano Region, Central Texas (R.I. 2); The Carboniferous Rocks of the Llano Region of Central Texas (Pub. 4329); High-Grade Clay in Cisco Group, North Texas; The Geology of Texas, Vol. I, Stratigraphy (Bull. 3232).

VERMONT

Organization.—Vermont Geological Survey, Burlington, Vermont, Dr. Charles G. Doll, State Geologist.

Topographic and Planimetric Mapping.—*Projects:* Jay Peak, Irasburg, Enosburg Falls and Londonderry quadrangles.

Others.—*Publications:* Report of the State Geologist on the Geology and Mineral Industries of Vermont.

VIRGINIA

Organization.—Geological Survey Division of Virginia Conservation Commission, Charlottesville, Virginia, William M. McGill, State Geologist.

Basic and Economic Geology.—*Projects:* Outline of the geology and mineral resources of Smyth County; Geology and mineral resources of the Lynchburg Quadrangle; Geology and mineral resources of Clarke and Frederick counties; Geology and mineral resources of the Lovingston Quadrangle; Geology of the Blue Ridge in central Virginia; Geology and mineral resources of the Vesuvius Quadrangle; Geology and oil possibilities of the Ben Hur district, Lee County; Geology and oil resources of the Rose Hill district, Lee County; Geology of the Valzinco district, Spotsylvania County; Geology and mineral resources of the Gossan lead district and adjacent areas; Industrial limestones and dolomites in the James River basin west of the Blue Ridge; Mica deposits; Piedmont marble belt. *Publications:* Commercial Granites and Other Crystalline Rocks in Virginia (Bull. 64); Industrial Limestones and Dolomites in Virginia; Northern and Central Parts of Shenandoah Valley (Bull. 65); A Tectonic Intrusion of Shale in Rockbridge County, Virginia (Repr. Ser. 14); The Catoctin Formation in Central Virginia (Repr. Ser. 15).

Water Resources. — *Projects:* Ground-water resources in the Roanoke area; Geology and ground-water resources of the York-James peninsula; Geology and ground-water resources of the Coastal Plain in northeastern Virginia. *Publications:* Chemical Character of Ground-water in the Coastal Plain of Virginia (Bull. 68); Genesis of Ground-waters in the Coastal Plain of Virginia (Repr. Ser. 13).

Topographic and Planimetric Mapping.—*Projects:* The following quadrangles: Boone Mill, Broadway, Callaghan, Clifton Forge, Dillons Mill, Edinburg, Fort Seybert, Goodes, Goshen, Leesville, Moneta, New Canton, Peaks of Otter, Radford Strasburg, Waiteville, Warm Springs and Williamsville.

Others. — *Publications:* Publications on the Geology and Mineral Resources of Virginia (Circ. 6); Geologic map and structure sections of the Rose Hill District; Detailed geologic map and structure sections of the Fenster Area of the Rose Hill District, Lee County, Virginia.

WASHINGTON

Organization.—Division of Mines and Geology, Olympia, Washington, Sheldon L. Glover, Supervisor.

Basic and Economic Geology.—*Projects:* Collecting and supplying highly varied information, chiefly of economic nature; Giving aid to exploration companies; Compiling history of exploration; Giving aid to coal operators; Investigation of antimony occurrences throughout the state; Preparation of spot maps with brief details and references covering all known metallic mineral occurrences in state; Preparation of directory of operators; Study of all saline deposits in state; Investigation of perlite and occurrences of obsidian; Preparation of spot maps with accompanying brief details and references covering all known nonmetallic resources; Preparation of directory of operators. *Publications:* 1947 Directory of Mining Operations (I.C. No. 13); Excerpts from "Washington Fuel Requirements and Supplies" (I.C. No. 14); Oil and Gas Exploration in Washington (I.C. No. 15); Coal and Coal Mining in Washington (R.I. No. 4R).

WEST VIRGINIA

Organization.—West Virginia Geological and Economic Survey, Morgantown, West Virginia, Dr. Paul H. Price, State Geologist.

Basic and Economic Geology.—*Projects:* Geologic Gazetteer; Stratigraphy of Greenbrier limestone; Roof strata of coal seams; Composition and properties of petroleum in West Virginia (Part II), Gas analyses; Dolomitic zone at base of Greenbrier limestone; Core analyses; Possibility of shaft mining Greenbrier limestone.

Water Resources. — *Projects:* Cooperative studies with U.S.G.S. *Publications:* Ground Water Conditions at Charleston, West Virginia (R.I. No. 2).

Others.—*Projects:* Spectrographic analysis of coal ash; Well sample studies. *Publications:* Analyses of West Virginia Brines (R.I. No. 1); Composition and Properties of Petroleum in West Virginia (R.I. No. 3, Part I); Future of Oil in West Virginia; Clays of West Virginia—Volume XVIII.

WISCONSIN

Organization.—Wisconsin Geological and Natural History Survey, Madison 6, Wisconsin, E. F. Bean, State Geologist.

Basic and Economic Geology.—*Projects:* Lead and zinc investigation in cooperation with the U.S.G.S.

Water Resources. — *Projects:* Ground water surveys in progress.

Topographic and Planimetric Mapping.—*Projects:* Areal mapping in cooperation with the U.S.G.S. *Publications:* Planimetric maps of Ashland, Iron Lake, Mokuah and Granview.

Others.—*Projects:* Soil surveys in progress in Longlade, Barron and Richland counties.

WYOMING

Organization.—Geological Survey of Wyoming, Laramie, Wyoming, Dr. Horace D. Thomas, State Geologist.

Basic and Economic Geology.—*Projects:* Pre-Cambrian geology of the Laramie Mountains; Stratigraphy and paleontology of the Tertiary North Park formation; Geology of the Labonte area, Laramie Mountains; Geology of the Broadway lead and zinc claims; Pumice occurrences in the Leucita Hills; Cordierite in the Laramie Range. *Publications:* Stratigraphic Sections of Mesozoic Rocks in Central Wyoming (Bull. 38).

Water Resources. — *Projects:* Geology and ground-water resources of the Ranchester area; Geology and ground-water resources of the Glendo area.

Others.—*Publications:* Map of Goshen County, Wyoming, showing possible commercial deposits of sand and gravel.

RECLAMATION AND IRRIGATION

By Michael W. Straus

Commissioner, Bureau of Reclamation, Department of the Interior

---

SCOPE AND VALUE OF RECLAMATION WORK

Water brought to arid and semi-arid lands in the 17 western states through irrigation works constructed by the Bureau of Reclamation in 1946 supported 94,000 farm families and was the basis of agricultural, commercial, and industrial activity of 1,400,000 persons in the reclamation areas.

The total gross value of irrigation crops on Bureau of Reclamation serviced lands in 1946 was $530,623,945, an increase of 21.9 per cent over 1945. The average gross value per acre was $120.69. In addition, other agricultural wealth in the form of cattle, sheep, poultry, eggs, butterfat, and similar products had an estimated value of some $150,000,000.

Works which had been constructed

by the Bureau of Reclamation brought a full or supplemental supply of irrigation water to 4,321,969 acres in 1946. This land was once desert, or in sagebrush, or dry-farmed, and it has been either reclaimed by the irrigation works, or provided with an adequate supply of water to supplement other available resources.

In the 45 years since the Bureau of Reclamation began operations, 100 storage dams and 68 diversion dams have been built in these western areas, with a reservoir capacity of 67,897,248 acre-feet. The Bureau has also built almost 16,000 miles of canal structures, and 335 tunnels with a total length of 566,000 feet.

The installed capacity of 32 power plants operated on Reclamation projects was 2,295,487 kilowatts as of July 1, 1947. Power sales in fiscal year 1946 were 11,500,000,000 kilowatt-hours, sufficient to light up 20 cities the size of Denver. The Bureau also operates more than 2,500 miles of transmission lines of various voltages to carry the power to market centers. Power development is not only needed in many cases to pump irrigation water, but the sale of surplus hydroelectric power is a major factor in meeting the growing needs of the West for energy and in reimbursing the United States Government for construction costs allocated to power, and in the cost of irrigation works which are in excess of the repayment ability of the water users. Repayment of funds advanced by the Federal Government to build Reclamation works comes primarily from water users and power users.

Collateral benefits arising from multiple-purpose river basin development, which is basic to Reclamation activity, include flood control, navigation improvement, sedimentation control, salinity repulsion, provision of domestic water supplies, fish and wildlife conservation, and recreational facilities.

CUMULATIVE BENEFITS

The cumulative value of crops grown on Reclamation-serviced lands from start of irrigation operations in 1906 to the end of 1946 was about $5,000,000,000. This is almost five times the total amount spent on Reclamation works, including those still under construction, since the program started upon passage of the Reclamation Act in 1902.

Several of our greatest American cities in areas with light precipitation would virtually pass out of the economic picture without the water supply they hoard carefully for irrigation, municipal uses, and hydroelectric power. Such cities as Los Angeles, Salt Lake City, Phoenix, and Denver are dependent upon careful conservation and judicious development of available water resources. Hundreds of other cities, towns and villages in the West, and thousands of farms look to development and operation under the Reclamation laws and supplemental legislation for maintenance of their present prosperous existence.

The spectacular population growth of the West, far ahead of the national rate in recent years, has a definite limiting factor in the availability of water. At the same time, development of the water resources makes possible the development of western agriculture, commerce, and industry.

On Federal reclamation areas—the irrigated agricultural sections and the towns among them—there were 1,057 schools, 1,668 churches, and 149 banks serving the population in 1946.

1947 CONGRESSIONAL APPROPRIATIONS

During calendar year 1947 the Congress provided $93,367,038 for the Bureau of Reclamation in the regular annual appropriation act. Later, the Congress voted a supplemental appropriation of $6,500,000, which included $6,400,000 for initiation and continuation of construction on dams in the Missouri River Basin to speed the realization of the flood control values inherent in Reclamation structures.

Repayment of the irrigation features of Reclamation construction was underway through approximately 300 contracts with water users or their organizations, and through application of power revenues. Repayments are in excess of 97 per cent of the amount due.

HOMESTEAD PROJECTS FOR VETERANS

More than 25,000 acres of public lands were opened to homestead entry in 1947 with Second World War veterans given preference by statutory regulations for these irrigated farm lands. Openings were held on the Shoshone Project in Wyoming, Yakima Project in Washington, Minidoka Project in Idaho, Riverton Project in Wyoming, Yuma Project in Arizona, Owyhee and Vale Projects in Oregon, and Gila Project in Arizona. Almost 400 farms were made available for settlement.

The demand for agricultural land in the West was indicated by the number of inquiries received for these openings—ranging as high as 300 inquiries for each available farm. Public drawings were held from among qualified veterans to determine who should have the opportunity to gain entry rights.

During 1946, irrigation water was made available on eight new projects and a new division of another project, totaling 31,243 acres. Among these was the W. C. Austin Project in Oklahoma, the easternmost Reclamation project. A survey showed that crop values on irrigated lands in this subhumid area increased to $130.72 per acre, compared to a crop value of $22.09 per acre on dry-farmed lands nearby.

POWER REVENUES

Reclamation-marketed power, surplus to irrigation pumping and similar operating needs, and incidental to river regulation and flood control, produced revenues of approximately $21,000,000 during 1946, which were applied not only to reimbursement of the Federal Treasury of principal and interest for the cost of constructing the power installations, but also toward repayment of parts of the cost of irrigation features which are beyond the ability of water users to pay.

General investigations of the remaining 21,000,000 acres of arable western lands which might feasibly be irrigated with the available water supply were continued on a reduced scale after July 1, 1947, in accordance with appropriations for this purpose, and one interim basin-wide report, on the Colorado River Basin, was sent to the Congress. A basin-wide report for long-range development of the Columbia River Basin was submitted to the affected states for review and comment. Several sub-basin and individual project reports also were completed.

CONTRACT AWARDS AND PROGRAMS

During the fiscal year ended June 30, 1947, more than 3,000 contracts totaling over $125,000,000 were awarded to contractors, construction material suppliers, and equipment manufacturers by the Bureau of Reclamation. For the fiscal year ending June 30, 1948, a construction work program amounting to $158,000,000 of available funds, was adopted in August 1947. This program, including the special Missouri River Basin projects for which the Congress provided supplemental funds to speed construction, was intended to provide or carry on construction which would bring full or supplemental water supplies during 1948 to 192,000 acres comprising 2,000 farms, including 50,000 acres to be opened for homestead entry by war veterans; installation of 489,000 kilowatts of hydroelectric power capacity, and other stream development benefits such as flood, salinity, silt control, fish and wildlife and recreation.

A program for succeeding years to 1954, geared to economical engineering and construction and designed to meet, in so far as possible, needs of the West, was drafted for presentation, to carry on uncompleted construction which has been authorized by the Congress. This contemplates both full and supplemental water supplies for 4,355,000 additional acres of land comprising 48,400 farms and installation of 2,250,000 kilowatts of hydroelectric power capacity by 1954.

YAKIMA AND OTHER PROJECTS

The Tieton Division of the Yakima Project in Washington, largely an orchard area, completed repayment of its construction charges to the Federal Government ahead of schedule and became the first major division of a project to accomplish full repayment.

Construction was begun on several large dams and a number of smaller structures. Included were the Enders Dam in Nebraska, Boysen Dam in Wyoming, and Tracy Pumping plant in the Central Valley of California. Construction continued on principal structures and works.

Transfer of Pacific slope waters to Atlantic side lands for irrigation occurred June 23, 1947, when Colorado river water caught and stored in Grand Lake Reservoir was first turned into the 13-mile long Alva B. Adams under the Continental Divide and emerged three hours later on the Big Thompson River slope. The tunnel was completed in 1946.

MISSOURI RIVER BASIN

Development of the Reclamation portion of the Missouri River Basin program received an impetus during 1947 when the Congress provided $6.400.000 in supplemental funds to initiate and continue construction on several dams so as to bring their flood control benefits into realization more speedily than regular appropriations would permit.

Construction was started during the fiscal year 1947 on Enders Dam in Nebraska and on Boysen Dam in Wyoming. Contracts were initiated for construction of Heart Butte Dam in North Dakota and Medicine Creek Dam in Nebraska, and preconstruction contracts were initiated on Canyon Ferry Dam and Moorhead Dam in Montana, Shadehill Dam and Bixby Dam in South Dakota, Cannonball Dam in North Dakota, and Keyhole Dam in Wyoming. In addition, construction was continued on two other Missouri Basin dams; Kortes Dam and power plant in Wyoming, and Angostura Dam in South Dakota.

The Missouri River Basin development contemplates bringing irrigation water to 5,560,000 acres of land that are not now irrigated, and to 560,000 acres of irrigated land at present insufficiently supplied with water. Hydroelectric power capacity, including installations at Army-built dams whose power will be marketed by the Bureau of Reclamation, will be increased by 1,600,000 kilowatts in the ultimate development. Other Basin developments include extensive flood control and navigation improvements by the Army Engineers, and municipal water, recreation, fish and wildlife conservation, and similar collateral benefits.

The comprehensive coordinated program was authorized by the Congress in the Flood Control Act of 1944 and 1946 on the joint recommendations of the Bureau of Reclamation and the U. S. Corps of Engineers.

COLUMBIA BASIN

The Columbia Basin Project in central Washington is designed to bring about 1,000,000 acres of fertile, arid lands to irrigated cultivation by using the waters stored back of Grand Coulee Dam. The project entails lifting the water 250 feet from the reservoir to the top of bluffs to the south, by giant pumps, at the rate of 7,000,000 gallons a minute, into a 27-mile equalizing reservoir created in Grand Coulee by placing earthen dams at each end, and then distributing the water by means of siphons, tunnels, and canals, to the irrigation area 50 to 100 miles to the south. An additional reservoir within the irrigation area, created by Potholes Dam, will control and re-distribute the water.

Construction during 1947 was active on the South Coulee Dam, a two-mile long earth and rock-fill structure, on Potholes Dam, and on siphons and tunnels connecting the main canals with the equalizing reservoir.

Bacon Tunnel, under construction, will be two miles long and 23 feet in diameter. Bacon Siphon will be 1,020 feet long, 23 feet in diameter. The Columbia Main Canal, under construction, will transport water from the Grand Coulee equalizing reservoir through the Bacon Tunnel and Bacon Siphon. The portion under construction will be 20 to 48 feet deep and from 95 to 200 feet in width. It will have a carrying capacity of 9,700 second-feet.

At the same time, additional generating capacity was brought into service at the Grand Coulee Dam power plant to help ease the power shortage in the Pacific Northwest. At the end of 1947, seven 108,000 kilowatt-capacity and two service generators were in operation, and installation of two more generators in the left powerhouse was underway. Three generators had been ordered for the right powerhouse, and turbines for three additional generators were being placed under contract. The ultimate capacity of Grand Coulee powerhouse when all generators are in service will be 2,190,000 kilowatts, making it the largest power plant in the world.

The Columbia Basin Project ultimately will be one of the development projects in the Columbia River drainage basin upon authorization of the basin-wide program submitted by the Bureau.

CENTRAL VALLEY OF CALIFORNIA

The Central Valley of California, a long-established agricultural area of rich production, has been faced for many years with a constantly diminishing water supply. The situation has become progressively acute with influx of new population in recent years. In addition, a power shortage of considerable proportions has developed.

The Bureau of Reclamation has undertaken a series of coordinated construction projects to provide dependable and sufficient supplies of water, produce electric power, and bring such other benefits as flood reduction improvement in river navigation, repulsion of saline waters from delta lands, and conservation of fish and wildlife. The more than 2,000,000 acres of rich farm lands in the 400-mile long valley are dependent, for the most part, on irrigation.

Shasta Dam, constructed near the headwaters of the Sacramento River, impounds floods created by melting snows in the mountains and transforms the water into electric energy at a 379,000 kilowatt hydroelectric power plant. The Shasta reservoir and the reregulation provided by Keswick Dam downstream, affords river control which also is designed to aid navigation and flush out the sometimes salty channels in the river delta. Reservoir releases also will provide fresh water for pumping from the delta to other areas in the valley. By means of the Delta-Mendota canal, Sacramento River water will be used to irrigate lands in the San Joaquin River Valley as far as Mendota to serve lands which are now irrigated from the San Joaquin River. The exchange will make possible the storage of San Joaquin River water behind Friant Dam, at the southern end of the valley, for diversion into the Friant-Kern and Madera Canals serving an area in critical need of supplemental irrigation water.

The Sacramento River water also will be used to carry added irrigation potential to lands between San Francisco and Stockton, by means of the Contra Costa Canal. In all, some 400 miles of main canals are to be constructed. Approximately 75 miles of the 160-mile long Friant-Kern Canal were under construction in 1947; 10 miles of the 47-mile long Contra Costa Canal; and 24 miles of the 120-mile long Delta-Mendota Canal. The 37-mile-long Madera Canal was completed in 1945.

Installation of two generators at the Shasta power plant, which had been loaned to Grand Coulee to help supply power for war industries in the Pacific Northwest, was near completion as the year ended. Additional generating capacity at Keswick Dam was under installation, and construction of a main transmission line to provide an outlet for this power was underway.

BIG-THOMPSON OF COLORADO

Diversion of Colorado River waters through the Rocky Mountains to the eastern slope before completion of the project works was made on a temporary basis to meet an acute need for irrigation water in the Big-Thompson Valley of Colorado. Irrigators provided a temporary pipe line to carry the waters from the Adams Tunnel to their irrigation ditches. Meanwhile, construction continued on Horsetooth Reservoir on the eastern side, near Fort Collins, Col., which will provide storage for the trans-mountain water until needed for irrigation. This reservoir will be formed by construction of four earth-fill dams and Satanka Dike. Work also was underway on Granby Dam, an 885-foot earth-fill structure 232 feet high on the Colorado River near Granby, Col. It will provide storage for 482,000 acre-feet of water, to be used for diversion through the Adams Tunnel. Rams Horn and Prospect Mountain Tunnels on this project will carry the diverted water down from the mouth of the Adams Tunnel to the eastern irrigation areas. Rams Horn will be 1.3 miles long and 10 feet in diameter. Together with Aspen Creek Siphon, a 10-foot 9-inch diameter conduit connecting with the east end of the Adams Tunnel, they will form a part of Power Canal No. 1, which terminates at Estes Park Power Plant, under construction at Estes Park, Col.

ANDERSON AND OTHER DAMS

Anderson Ranch Dam on the South Fork of the Boise River, Idaho, will be the highest earth-fill dam in the world, rising 456 feet above bedrock. It will be 1,350 feet long. The reservoir capacity will be 500,000 acre feet. The ultimate power plant will have 40,500 kilowatt capacity. Work on this dam was temporarily halted during the year because of lack of funds, but resumption of operations brought it to completion.

Cascade Dam, on North Fork of Payette River, near Cascade, Idaho, will be an earth- and rock-fill dam 785 feet long and 107 feet high, impounding 700,000 acre-feet of water.

Davis Dam, on the Colorado River 35 miles west of Kingman, Ariz., will be an earth- and rock-fill structure 1,600 feet long and 138 feet high, with storage capacity of 1,820,000 acre-feet of water. A power plant will have capacity of 225,000 kilowatts. Construction continued during 1947, with a completion date of 1950 set by the Mexican Water Treaty, which provides for release of Colorado River waters to Mexican lands.

COACHELLA CANAL

Coachella Canal, a branch of the All-American Canal in Southern California which taps waters released from Hoover Dam and Imperial Dam on the Colorado River, will be 125 miles long. About 117 miles have been completed. It will serve 75,000 acres of irrigated lands in the Coachella Valley to the north of Imperial Valley, which is now served by the All-American Canal.

DUCHESNE TUNNEL

Duchesne Tunnel, on the Provo River Project in Utah, about 30 miles northeast of Deer Creek Reservoir, will be six miles long and will divert irrigation water from upper tributaries of the Duchesne River. Salt Lake Aqueduct, on the Provo River Project will be 41 miles long and will tap Deer Creek Reservoir to provide industrial and domestic water supplies in Salt Lake City and also serve irrigation needs.

NEED FOR RECLAMATION

Since lands in the 17 western states, except for some coastal and high mountain areas, have scanty rainfall, resort to river waters which are fed by melting snows in the mountains has been made almost since men first began to settle there, to sustain life and develop agriculture. Most areas have less than 20 inches of rain a year, compared to 40 to 50 inches in eastern states, and many sections have less than 10 inches, and some as low as two or three inches. Transformation of the desert areas, which are fertile but can not yield sustenance for modern civilization without sufficient water, is the basis of Western growth and development.

PUBLIC LANDS

By Fred W. Johnson

Director, Bureau of Land Management, Department of the Interior

---

ADMINISTRATIVE REORGANIZATION

Kaleidoscopic changes in plans and procedures to meet increased world demands for natural resource development marked the advancement in public land administration during the 1947 fiscal year. In activities centered upon maximum beneficial use of the Nation's land, forage and water, timber and minerals, the President, the Congress, and the Department of the Interior took official steps to integrate the program for more efficient management of the 778,000,000 acre public domain in the United States and Alaska. On July 16, 1946, orders were promulgated establishing the Bureau of Land Management in the Department of the Interior through consolidation of the General Land Office and the Grazing Service in accordance with Reorganization Plan No. 3 of 1946.

Localized handling of public land problems was provided through regional offices maintained by the Bureau at the following points: Region No. 1, encompassing the States of Idaho, Oregon and Washington, with headquarters at Portland, Oregon; Region No. 2, Nevada, California, with headquarters at San Francisco, California; Region No. 3, Montana, Wyoming, North Dakota, South Dakota, Nebraska, Kansas, Iowa and Missouri, with headquarters at Billings, Montana; Region No. 4, Utah and Colorado, with headquarters at Salt Lake City, Utah; Region No. 5, Arizona, New Mexico, Texas, Oklahoma, Arkansas, and Louisiana, with headquarters at Albuquerque, New Mexico; and Region No. 7, Alaska, with headquarters at Anchorage.

PUBLIC LAND DEVELOPMENT

This trend toward greater efficiency in the field of national economics throws the spotlight of interest upon other cycles in public land history and the part they played in the development of the nation. The first cycle, which began shortly after the birth of the Republic, witnessed the disposal of large areas of the Federal domain for cash with which to meet the costs of the American Revolution, and subsequent government expenditures.

The second cycle began in 1863, when President Abraham Lincoln signed the first homestead law and the cash disposal policy gave way to the era of settlement which carried American civilization westward to the Pacific. The same cycle encompassed the grant of public lands for the beginning of the nation's network of highways and roads, and public school systems.

The fourth cycle was ushered in shortly after the beginning of the Twentieth Century when the consequences arising from decades of generous contributions from the nation's store of public land made necessary a protective policy of natural resource conservation. The soundness of this policy, which was given the effectiveness of a national administration program in 1933, was fully demonstrated in the Second World War, when a greater contribution than ever before was able to be made to the military effort from the land and resources of the United States. It was in order to provide the same effectiveness in meeting the economic problems of the post-war period, that the plan for streamlined procedure was actively set under way in 1947.

It is a unique as well as a particularly fortuitous circumstance of history that the basic administrative structure utilized in today's program is fundamentally the same as that which undertook the management of the Federal public lands after the American Revolution. Chronologically, Federal land administration began with the Ordinance of 1785, largely sponsored by George Washington and Thomas Jefferson, under which the Continental Congress directed the manner by which identification of land in the new Republic should be undertaken and laid down steps for its disposal. In 1812, this responsibility was lodged in a General Land Office set up as a Bureau in the Treasury Department. When the Interior Department was established in 1849, the General Land Office was transferred to that Department.

Thus the valuable asset of more than 160 years of continuous operation and accumulated experience in the handling of public land problems was ready at hand to meet the demands of the present world economic situation. Added to this was the knowledge and skill acquired by the Grazing Service of this Department in administering the approximately 145,700,000 acres of Federal range land.

REVENUES

For many years the General Land Office, prior to its consolidation in the Bureau of Land Management, had been one of the few agencies of the Federal Government whose operations have resulted in revenues in excess of the cost of administration. This record was maintained by the Bureau itself in the 1947 fiscal year, total receipts being $21,012,154, and total expenditures $6,288,030. This surplus of receipts over expenditures out of appropriations represents a ratio of $4.78 for every dollar spent on the operation of the former General Land Office and Grazing Service.

HOMESTEADS

During the year the continued scarcity of housing accommodations in the United States found its reflection in heavy demands, particularly from veterans of the Second World War, for home-making opportunities on the Federal public domain. Overlooking the fact that the good free farm land which was available at the end of the Civil War had practically all passed into private hands many years ago, thousands of persons sought information from the Bureau as to the availability of the public lands for acquisition under the homestead laws.

Except for the farm lands provided through the irrigation program of the Bureau of Reclamation and some portions of the public domain in Alaska, the limited amount of public land suitable for agricultural settlement is indicated by the fact that less than 500 applications for such use throughout the entire United States were approved during the fiscal year.

SMALL TRACTS

The Small Tract Act of 1938 virtually has displaced the original homestead law of Abraham Lincoln's day as the popular method for obtaining public land. Under this law the Secretary of the Interior is authorized to lease or sell not more than five acres of surveyed public land for use as a home, camp, cabin, health, convalescent, recreational or business site. In subsequent legislation, Congress gave veterans of the Second World War preference rights in the filing of applications for such tracts.

Anticipating the demand for this type of land use, the Bureau through various land classification orders made approximately 15,000 acres available for lease in California, an additional 10,000 acres in Arizona, and at the end of the year provided for the utilization of areas in Idaho, New Mexico, Nevada, and Wyoming for small tract lease purposes. Meantime, approximately 7,500 applications and 5,000 leases were handled by the Bureau during the year.

The popularity of this type of public land use was materially increased by the Secretary of the Interior near the end of the 1947 fiscal year through the issuance of regulations authorizing the purchase of a tract under certain conditions after one year's tenancy under a government lease. At the same time its scope was enlarged by legislation which made its provisions applicable to the Territory of Alaska as well as to the public lands on the continent of the United States.

MINERALS, TIMBER, AND OTHER RESOURCES

The public lands of the United States continued to contribute their share of the world's supply of natural resource products during the 1947 fiscal year. Production of petroleum from the public domain, for example, aggregated 64,043,460 barrels, an increase of 7½ per cent over 1946, while the total production of natural gas exceeded 97,500,000 M cubic feet, an increase of 1½ per cent over that of 1946. The production of gasoline and butane from the public lands reached 125,584,258 gallons, a rate of increase of 3.9 per cent.

Proceeds to the Government from the development of these and other mineral resources under government lease aggregated more than $16,200,000 during the 1947 fiscal year.

The economic value of sustained yield forestry management operations —the maintenance of a reasonable balance between the volume of tree-cutting and tree-growing—is becoming increasingly recognized by both private individuals and government agencies concerned with the development and production of the nation's timber resources.

The application of this policy to timber resources on all of the public lands of the United States was authorized in legislation passed by Congress during the 1947 fiscal year. At the same time legislation providing for the sale of other types of materials from the public domain resulted in further increase in the Bureau's workload for the year. Plans for a general sustained yield inventory and the preparation of regulations governing the administration of the new laws were brought near completion at the end of the fiscal period.

Meantime, the 2,500,000 acres of Oregon and California revested railroad grant lands and reconveyed Coos Bay wagon road grant lands in western Oregon continued to afford a striking example of the practical advantages inherent in the sustained yield forestry management program.

With a continuous supply of raw material assured, the sale of timber from the Oregon and California lands reached an all-time high, the 517,296,000 board feet sold being valued at more than $3,500,000 or twice as much return to the Government as in the 1946 fiscal year.

ALASKA LAND PROGRAM

Pursuant to the national policy of utmost cooperation in the development of land settlement opportunities and the expansion of industry in Alaska, activities of the Bureau were centered upon an integrated program containing the following highlights of achievement:

Special crews of surveyors and land experts were engaged during the Alaska field season in conducting investigations looking to the maximum beneficial use of the land and its resources.

Special studies were completed on the possibilities for settlement by groups of individuals in Alaska, and new regulations authorizing such settlement were approved by the Secretary of the Interior.

A report on a study of the areas in Alaska best suited for agricultural settlement was prepared, and a comprehensive cadastral survey program, which included the measurement of more than 12,000 acres in 12 separate tracts for lease or sale under the Federal Small Tract Act, was set under way.

Foremost among the Bureau's achievements was the preparation of official public land orders which, becoming effective shortly after the close of the 1947 fiscal year, opened large areas of land in Alaska to settlement by veterans of the Second World War. One of these lifted the restrictions formerly placed upon lands adjacent to the Alaska Highway and made available approximately 2,750,000 acres of public land available for settlement under the public land laws. Another opened approximately 45,000 acres of public land in the Matanuska Valley to homesteading.

RANGE MANAGEMENT

A total of 8,784,327 livestock was authorized on the Federal range by license or permits during the year. This is a net reduction of 49,632 cattle, 11,041 horses, 539,201 sheep, and 13,555 goats, as compared to the 1946 fiscal year. The number of licensed operators decreased from 21,000 to 20,960.

AREA OF THE PUBLIC LANDS

The area of public land remaining in Federal ownership, including Indian trust and tribal lands, as of June 30, 1947, amounted to about 413,000,000 acres in the public land states and about 365,000,000 acres in Alaska. Approximately 434,000,000 acres of these public lands were vacant, unappropriated, and unreserved as follows: 37,000,000 acres in the states outside of Federal grazing districts; 132,000,000 acres within such districts; and 265,000,000 acres in Alaska. During the year, 729,000 acres were withdrawn for various public purposes, while withdrawals reserving 20,235,000 acres were revoked.

Of the approximately 778,000,000 acres remaining in Federal ownership in the states and Alaska, 117,000,000 acres in the states and 363,000,000 acres in Alaska were still unsurveyed as of June 30, 1947.

PUBLIC UTILITIES

By H. M. Olmsted
Public Utility Engineer-Accountant

GENERAL

The demand for public utility services in 1947 continued to increase, resulting in further all-time records of production in the electric light and power field, accompanied by a threat to the sufficiency of generating capacity; occasional shortages in supply of natural and manufactured gas; a huge backlog of still unfilled orders for telephones; and heavy loads on transportation and various other utilities. Labor in public utility industries continued to be restive, but with less disturbance to continuity of service than in 1946. Increased costs of labor and material contributed to a considerable and frequently successful movement for rate increases, particularly as to manufactured gas, telephones, and transportation. Atomic energy as a potential additional source of electric power remained in the experimental stage without apparent danger to the usefulness of existing installations. The balance between public and private enterprise in utility fields kept comparatively stable, with a rather small extension of public ownership.

ELECTRIC LIGHT, POWER OUTPUT AND CONSUMPTION

The 1947 curve of weekly electric output, compiled by the Edison Electric Institute, was at all times above that for 1946, and except for a few specific weeks was above the wartime level of 1944. The record high of 4,940,453,000 kilowatt-hours in the week ended Dec. 21, 1946 was exceeded in September, and by the week ended Dec. 20 a new high of 5,367,624,000 kwh was attained. The weekly figures, for the country as a whole, were then running nearly 9 per cent above 1946. The west-central states showed the largest increase, about 12 per cent above the period a year ago.

New residential and farm customers were being added at a rapid rate, with the prospect of an increase nearly equal to that of 1946, when 2,109,218 customers were added, according to the EEI. The first eight months of 1947 were reported to have brought 1,268,000 new connections, of which 435,000 were farms, making a total of 3,771,000 farms supplied from electric lines. This number was given as 64 per cent of all farms, and it was predicted that this percentage would rise to 67 per cent by the end of 1947. Somewhat over half are served by privately owned companies and the remainder by Rural Electrification Administration cooperatives, municipal systems, or other public bodies.

In October it was estimated that reserve capacity, which was about 12 per cent above peak demand in 1946, according to the EEI, would drop to 7 or 8 per cent in 1947, with occasional necessity on some power systems to cut off interruptible loads for brief periods. By December it appeared that the peak demand would rise to 49,500,000 kilowatts, with dependable capacity placed at 49,600,000 kw by the Federal Power Commission. The rising demand for electrical energy was attributed to various factors, including a large increase in customers and in customer usage, greater electrification of industry, and relatively low cost of energy.

In the Pacific Northwest, where a shortage of capacity *vs.* demand was feared, the situation was helped by the addition at Grand Coulee, huge Washington hydro plant in the Bonneville power system of the Federal Government, of a 120,000-kw generating unit late in the year. Grand Coulee's six 108,000-kw generators had been operating at average peak loads of 130,000 kw each.

The major utility companies in Oregon and Washington issued a joint statement that investors and managements of publicly and privately owned industrial and electric distribution enterprises in those states were planning their programs in the belief that the Federal Government would continue to assume responsibility for providing all or a substantial part of additional generating capacity needed there. However, opposition of the privately owned industry to further extension of public power projects continued strong, and Congress severely restricted public power funds, so much so that in one instance (Bonneville) protests came from private power industry spokesmen.

In late November the FPC urged emergency interconnections of electric utility systems as the only important means not fully utilized to effect maximum use of existing generating capacity. It offered exemption from regulatory restrictions, as to advantageous energy exchange arrangements, under emergency provisions of the Federal Power Act. Major interconnections were specifically recommended for 11 areas in the East and Midwest. The Commission noted that manufacturers had been unable to supply electric equipment fast enough to meet generating needs, resulting in unavoidable installation delays. Fuel shortages and extreme drought conditions, especially in the northeast in October, contributed to the power stringency.

DEMAND FOR GENERATING EQUIPMENT

A report of Interior Secretary Krug in September to President Truman, on national resources, held that with regard to electric power, domestic demand for generating equipment will equal if not exceed production thereof for at least two years, but that after 1949 annual production of such equipment will exceed national requirements by 500,000 to 1,000,000 kw. It also indicated that electric power supply would be tight until 1950, but without a national "power famine." The conclusions were on the basis of continuation of high employment and production.

Efforts to offset rising costs of steam generating plants include adoption of larger sizes of units, higher steam temperatures, centralized controls, simplified maintenance, and standardization.

CONSTRUCTION PROGRAM FOR POWER PROJECTS

The Bureau of Reclamation, in the Department of the Interior, is expected to present a $2,000,000,000-six-year construction program to Congress in 1948, of which about $800,000,000 is reported to be for power projects, with some $295,000,000 assigned to the next fiscal year. Secretary Krug stated that completion of the six-year program would add less than half of all Reclamation projects that have thus far been authorized. Plans include the installation of 2,752,000 kw of new capacity by 1952.

Important electric power legislation before Congress at the end of the year included the Vandenberg bill for construction of the St. Lawrence waterway and power project, which had been approved 9 to 4 by the Senate foreign relations committee; also bills transferring to private power companies certain of the benefits of Federal power projects as to which public agencies now have preference, and the Miller bills for limiting the jurisdiction of the FPC.

The latter bills, introduced by Representative W. J. Miller of Connecticut include one to restrict the definition of navigable streams upon which the FPC has jurisdiction for licensing and regulating private power projects, and also to restrict the licensing power itself. Another would strictly limit the jurisdiction of the FPC over intrastate electric power where it now has jurisdiction because of interstate sources or other relationships. The National Association of Railroad and Utilities Commissioners favored these bills, provided state commission control is suitably protected. In November and December the FPC held a series of conferences with representatives of the NARUC and the National Association of Electric Companies, to discuss compromise measures.

The scope of long-distance transmission of electrical energy has been increased by use of higher voltage; for experimental purposes this even went to 500,000 volts on two 1½-mile test lines in Ohio, more than twice as high a voltage as is now utilized at all extensively.

HEAT PUMP TESTS

Increased interest developed during the year in the "heat pump," a device for heating buildings by a reverse refrigeration process, powered by electricity; heat is taken from the ground, the air or water, even at fairly low temperatures, by the refrigerant and carried into buildings in sufficient quantity to heat them, by a cycle of evaporation, compression, and condensation, in a piping system. At the EEI convention in June it was reported that large-scale production of heat pumps would begin some time in 1948, and was expected to provide a substantial and growing electric power load, in as much as average electric requirements of a heat pump are given as from 4,000 to 9,000 kwh per season, depending on location and climate. A group of electric companies commissioned three major manufacturers of heating and air-conditioning equipment to supply heat pumps for testing during the 1947-48 winter in various locations.

In October, Chairman David E. Lilienthal of the Atomic Energy Commission stated that "no one should delay sound and economical additions to power supply, whether by fuel-generated electricity or by water power, because somewhere in the future atomic energy will come on the scene as an additional source of supply. There will certainly be ample time to make whatever adjustments will be needed."

PUBLIC UTILITY OWNERSHIP IN NEBRASKA AND TENNESSEE

With the Omaha Public Power District taking title to the properties of the Nebraska Power Co. in 1947, all electric utilities in Nebraska are now publicly owned. This is also the case, substantially if not entirely, in Tennessee, where the Tennessee Valley Authority supplies electrical energy through municipal or cooperative utilities. Although acquisition costs in Nebraska have been criticized, average electric rates per kwh are reported below the national average, whereas some years ago the Nebraska average was well above the national.

In May the Court of Appeals, highest New York state court, decided 4 to 3, in a suit brought by the Staten Island Edison Co., that a utility company claiming that rates ordered by the Public Service Commission were confiscatory was entitled, on sufficient showing, to relief by injunction and a court trial on the merits—thus reversing legal procedure of long standing in that state, and in Federal circles, whereby court review was limited to considerations of law and the existence of substantial evidence in support of the Commission's decisions. A serious obstacle was thus placed in the path of expeditious rate regulation in New York, but the remainder of the year passed without a test of its magnitude.

GAS

At the 29th annual convention of the American Gas Association in October, R. H. Hargrove, the retiring president, asserted that the gas industry is at the peak of its activities. He decried fears of exhaustion of natural gas reserves, stating that more and more fields have been discovered, so that present estimates of reserves are 600 per cent greater than the 1925 estimate and 90 per cent greater than that of 1940. He referred to local gas shortages that have occurred, accentuated by demand for gas house-heating, which has been restricted in some localities, at least temporarily. He urged that the industry equip itself to handle the winter heating demand and to attempt to balance it by a summer load in the developing field of gas air-conditioning. He also stressed increasing costs of labor and materials. These have brought about company demands for higher gas rates, met in various instances by substantial increases, notably in New York City.

The AGA announced in October that gas revenues in the 12 months ended June 30, 1947 amounted to $1,313,800,000, a gain of 13.4 per cent over the preceding 12 months; the number of customers in mid-1947 was given as some 21,000,000.

After protracted hearings and consideration the FPC finally authorized the Texas Eastern Transmission Corp., purchaser of the so-called Big Inch and Little Big Inch pipe lines, constructed by the Federal Government for wartime transportation of oil, to use the lines for transmitting natural gas, on a permanent basis, from Texas to Philadelphia and other eastern points. This company has indicated its intention to apply for authority to extend its lines to serve New York City. Another company, the Trans-Continental Gas Pipelines Co., Inc., has applied to the FPC for authority to build a $150,000,000 line from Texas to the Hudson River.

INTRASTATE PIPELINE REGULATION

Authority of the FPC to regulate the price charged by one interstate production and transmission company for natural gas delivered from its production fields in one state (Louisiana in this case) to other pipeline companies for use in other states, was unanimously affirmed by the U. S. Supreme Court on June 16, 1947 in *Interstate Natural Gas Co. vs. Federal Power Commission.* Such regulation has been attacked as contrary to the Natural Gas Act of 1938, which exempted the production or gathering of natural gas from the jurisdiction of the Commission, and counsel for the natural gas industry contended that the FPC could not legally regulate in any respect the intrastate field operations of a pipeline company. The Court stated, however: "The gas moved by petitioner to the points of sale consisted of gas produced from petitioner's wells commingled with that produced and gathered by other companies and introduced into petitioner's pipeline system during the course of the movement. By the time the sales are consummated nothing further in the gathering process remains to be done. We have held that these sales are in interstate commerce. It cannot be doubted that their regulation is predominately a matter of national, as contrasted to local, concern."

The FPC has apparently dealt only with factors in the control of the pipeline companies or their affiliates, in respect to property, production costs, etc. By an order adopted on Aug. 7, 1947 it assured independent producers and gatherers of natural gas that "they can sell at arm's length and deliver such gas to interstate pipelines and can enter into contracts for such sale without apprehension that in so doing they may become subject to assertions of jurisdiction by the Commission under the Natural Gas Act."

In February certain Natural Gas Act amendments, sponsored by oil and gas companies, were proposed to Congress in an attempt to deprive the FPC of any power of regulation concerning gas production. A somewhat modified bill passed the House of Representatives and was pending in the Senate late in the year.

Forty small cities in Alabama, Georgia, and Florida undertook the installation of natural gas distribution systems, to be financed by revenue bonds estimated at $20,000,000; about 60,000 customers, including some large industries, were involved.

TELEPHONES

The fiftieth anniversary meeting of the U. S. Independent Telephone Association, Oct. 13-16 in Chicago, emphasized the fact that, though the Bell telephone system, headed by the American Telephone & Telegraph Co., includes most of this country's telephones, particularly in the big cities, independent companies numbering some 6,000 provide telephone service in almost two-thirds of the nation's area, own and operate about 20 per cent of total telephones and have extensive toll lines of their own which connect with Bell toll lines to form a nationwide long-distance telephone system.

Telephone equipment shortages caused by the war were gradually overcome during the year. The demand for telephones in the Bell system was stated in October to be 2,000,000, with telephone installations running at the rate of 3,000,000 annually; 5,700,000 had been made since V-J Day (Aug. 14, 1945). Late in November the New York Telephone Co. announced that its waiting list or backlog had in ten months been reduced from 450,000 to 350,000, of which 285,000 were in New York City, and that it would be cleared up in 1948. A half million customers had been added since September, 1945; and on Monday, Nov. 24 a total of 15,415,470 telephone calls were made in New York City, a large increase over the prior record.

Many applications for telephone rate increases were made by both Bell and independent companies, spurred by increases in wages and cost of materials and equipment; and many such requests were granted, in whole or in part, by regulatory bodies. In the Bell system, increases totaling $50,000,000 per annum were obtained between April and August, with applications pending for $90,000,000 and announced plans for $50,000,000 additional.

President Walter S. Gifford of the A. T. & T. Co. announced in October that his company in 1947 would earn its usual dividend of $9 per $100 share of common stock; stockholders were reported as about 717,000 in number. The company made three huge issues of debentures during 1947. In June an issue of $200,000,000, the second of the year, was purchased by underwriters at a bid of 2.7826 per cent yield, with a coupon rate of 2⅞ per cent, and was reoffered to the public at 107⅞, to yield about 2.76 per cent. In October another issue of $360,000,000 was announced, to be dated Dec. 15, 1947, with 10-year maturity. It was stated that the new funds would be used for the expansion program of system companies.

LOCAL TRANSPORTATION

Passenger travel on local street-car, bus, and rapid transit lines continued at a high level in 1947, but expenses increased, especially labor costs, and profits were generally reduced, or eliminated in various instances. In some cases bus companies went out of business; in New York City the company serving Staten Island, and the North Shore Bus Co., one of seven serving the borough of Queens, gave up their franchises and operation was taken over by the Board of Transportation, which operates all the rapid transit lines in New York City and all the street-car and bus routes in the Borough of Brooklyn. However, a dozen other private bus companies continue to operate in Manhattan, the Bronx, and Queens with varying financial results, particularly good in Manhattan.

All three classes of transit operated by the Board of Transportation showed operating deficits under the 5¢ fare in 1947, and Mayor O'Dwyer proposed a fare rise to 8¢ to cover operating expenses (leaving interest and amortization of debt to be met out of taxes) as part of a larger plan of municipal finance. The merits of zone fares, to rationalize riding and revenues, received no apparent weight.

A considerable movement for increased fares on transit lines, both public and private, developed during the year. The Philadelphia Transportation Co., operating the city-owned subway as well as street-car and bus lines, obtained a fare increase from 8¢ to 10¢. In St. Louis and Washington the privately owned systems obtained increases in the price of weekly passes. On Seattle's public system the fare was increased from 8⅓¢ to 10¢. Some reductions occurred, however, including extension of the 5¢ fare on lines of the Westchester Street Transportation Co., in suburban Westchester, adjoining New York City.

The Chicago Transit Authority, a public corporation, on Oct. 1 took over the properties of the Chicago Surface Lines and the elevated railway of the Chicago Rapid Transit Co. for combined operation along with the new city-owned subway. The price paid for the surface lines was $75,000,000; that for the elevated lines was $12,162,500. The surface fare, which was increased from 8¢ to 9¢ in the spring, was further increased to 10¢. The El fare remained at 12¢, but transfers to surface lines are given. The Authority sold a $105,000,000 bond issue to effect the purchase and to provide funds to initiate an extensive ten-year rehabilitation program, including new El cars, replacement of many street cars by buses, and extension of bus routes.

In Boston and 13 surrounding municipalities the Metropolitan Transit Authority was created by the 1947 Massachusetts legislature for unification and improvement of service in the entire area, with transfer of Boston transit lines from private to public ownership, through proceeds of a $23,000,000 bond issue.

Seven of the 12 largest cities in the United States now own all or a large part of their local transportation facilities: New York, Chicago, Philadelphia, Detroit, Cleveland, Boston, and San Francisco.

UTILITIES FINANCING

The vast program of refunding of utility and other corporate bonds in recent years to take advantage of lower interest rates was considerably diminished in 1947; however, issues of securities for "new money" increased substantially, despite a hardening of interest rates. The bond market as a whole slowed up very materially, but showed a tendency to improve toward the year's end. *The New York Times* average of domestic bond prices declined from a high of 98.4 in February to about 91 in December; the 1946 range was from 103.6 to 95.7. Utility bond issues in December attracted active bidding, however, at low interest rates compared to a few years ago; high-grade bonds still sold at yields of less than 3 per cent.

LABOR RELATIONS

Unionization of public utility employees continued to spread in 1947, and was accompanied by serious labor disturbances in the early part of the year, substantially declining thereafter. Increased cost of living brought indications of renewed demands for wage increases in 1948, particularly if inflation is not effectively met.

Strikes of utility workers in 1946 and 1947, some of them widespread and disruptive, contributed to adoption of legislation in several states to restrict or prohibit strikes in public utilities. Such legislation, including provisions for compulsory arbitration, was passed during 1947 in Indiana, Missouri, Pennsylvania, Michigan, and Wisconsin. Virginia has a similar law dating from 1946.

In New Jersey, where state seizure of strike-bound utilities had been authorized in 1946, but without drastic penalties, legislation was adopted in April to require compulsory arbitration and authorizing jail sentences and fines if a utility strike continued. The state had taken over the property of the New Jersey Bell Telephone Co. to end a strike, but the strikers had not returned. Constitutionality of the law is being tested in the state courts; a test in Federal court, carried to the U. S. Supreme Court, was deferred pending the state court action.

Texas, in addition to banning the closed shop generally, adopted a law restricting picketing that aims to interfere with public utility service (other than telephone and other communications).

In New York State a law was passed outlawing strikes by public employees—which would include subway and other transportation employees of New York City, who have threatened strikes. Mayor O'Dwyer, although not approving this legislation, had announced that neither a closed shop nor any right to strike could be recognized in the city's transit system.

Under the Taft-Hartley Federal labor law, effective June 23 over President Truman's veto, the Federal Government can seek an injunction against a strike in emergency cases affecting national health and safety as well as substantially an entire industry (such, conceivably, as in the telephone or electric field). The injunction would be for not more than 80 days pending inquiry and efforts at adjustment, with final reference to Congress if the dispute is not settled.

The chief strike in 1947 was in the Bell telephone system, over a demand of the National Federation of Telephone workers and cooperating unions for industry-wide bargaining and a general wage increase of $12 a week (or roughly 25 per cent). The strike began on April 7. On April 30, New York Telephone workers expressed willingness to accept a $4 increase but did not return to work until May 5 because of picket lines of A. T. & T. Co. and Western Electric Co. workers. Shortly after, a series of local settlements was made, at various rates of increase granted by different companies of the system. By May 18 nationwide service was nearly normal, and on May 20 the last major dispute, the Western Electric strike, ended with an average wage rise of 11½¢ an hour.

The Utility Workers Union of America (CIO) held its second annual convention in October and laid plans for compliance with the Taft-Hartley law and for competing for utility employees with the International Brotherhood of Electrical Workers (AFL). The UWU claimed to have contracts covering 72,000 utility employees, and to have 3,000 other members in plants still in process of organization. A policy was announced of crossing picket lines if necessary to comply with contracts, except where a primary employer has engaged non-union workers to break a strike.

The United Utility Unions of America, a loose federation of nine or more independent unions, dissolved Oct. 11 at a St. Louis meeting, with the expectation that most of the component unions, particularly that of Duquesne Light Co. employees, in Pittsburgh, would affiliate with the UWU. Dissolution was ascribed to the feeling that alignment with a national utility union would help overcome restrictions caused by state and national labor legislation.

Acting under a law adopted in Pennsylvania in June to prevent utility strikes, Governor James H. Duff appointed a 12-man labor-management committee with the duty to suggest a list of arbitrators from which the Governor was to select a panel of 12 members who would be available to arbitrate labor disputes if necessary. Labor members of the committee included George L. Mueller, president of the independent union of the Duquesne Light Co. and leader of the disastrous 1946 Pittsburgh electric strike, as well as representatives of the AFL and CIO. Management members were from electric and other utilities.

CONCLUSION

The end of the year found the chief problem of the major utilities that of supplying unprecedented demands. Lack of full capacity to do so extended back to the manufacturers of equipment. Further difficulties in the way of rapid expansion were imposed by high cost of equipment and of its installation, and a less favorable market for securities. The general inflationary situation besides affecting these conditions, increased the cost of operation and stimulated action for rate increases—and for wage increases; hence, stabilization became highly important to the utilities. The labor situation, while relatively quiescent, held portents, also related to inflation, of trouble to come, pointing up the dilemma of fair wage determination and labor policy in an essential industry with controlled prices and profits, or, in the case of publicly owned utilities, without profits but with labor and material costs inherent elements of the cost either to consumers or taxpayers.

WATER SUPPLY

By Clinton L. Bogert
Consulting Engineer, New York

CONSTRUCTION

Questionnaires sent to State Sanitary Engineers by the American Water Works Association in April, 1947, elicited the general opinion that the inter-related factors of rising costs of construction, shortages of labor and materials, and slow deliveries, are dominant considerations in retarding post-war construction. The Construction Cost Index of the *Engineering News Record* continued to rise throughout the year, from 174.24 in November 1946 to 206.36 in November 1947. Replies from water works operators in *Water Works Engineering*, Nov. 12, 1947, stress the very slow delivery on cast-iron pipe and valves. James E. Gibson of Charleston reports in *Water Works Engineering*, July 6, 1947: "The schedule of improvements and extensions outlined for 1946, has not been completed on account of delays, strikes, inefficiency of workmen, and difficulties in obtaining material."

Construction went ahead on Merriman Dam for New York City, and on the $9,000,000 tunnel at Baltimore. Miami completed a $710,000 cast-iron transmission line and a $585,000 addition to Hialeah filter plant. Omaha carried out all 1946 plans at a cost of $800,000. Nine major items on the 5-year program at Dallas were completed or under contract during 1947, at costs 20 to 40 per cent above the 1946 estimates. The $14,000,000 program at St. Louis was deferred until conditions became more settled.

NEEDED WATER SUPPLY FACILITIES

The results of the first nationwide inventory of sanitation needs in continental United States by the Sanitary Engineering Division of the United States Public Health Service, Federal Security Agency, Washington, D. C. were reported in a release dated July 6, 1947.

About one-third of the $2,200,000,000 need for water works is for the development of water supply sources. This reflects the high cost of completing New York City's Delaware watershed supply; development of an upland supply to replace Philadelphia's present highly polluted supply sources; and additional developments to augment Denver's existing sources of supply. Approximately one-sixth of the water works needs is for treatment facilities and about one-half for distribution systems.

These water works needs include 5,700 complete water works systems, most of them for towns of less than 1,000 population and improvements to the systems in 14,800 other communities. Some 3,200 new water treatment plants are needed as well as improvements or additions to 4,700 existing plants. More than 45,000 miles of water mains of various sizes are needed for the distribution systems.

ADJUSTMENT OF RATE STRUCTURES TO RISING COST LEVELS

Howson (*Journal of the American Water Works Association,* September, 1947) finds the revenues of 100 water works for the 5-year period (1941-6) have increased 19.4 per cent, and operating expenses 27.8 per cent, but the increases in the last year, 1945-1946, were 4.9 and 11.1 per cent, respectively, a much greater disparity. Water costs 4 cents per ton, and coal $3.18. Commodities other than water have increased in cost as a general average approximately 50 per cent since the beginning of the war, whereas the cost of water has remained substantially static.

He concludes, in brief: 1. Water works should have increased revenues within the near future, or their service and development must be curtailed; 2. the average increase throughout the country should be approximately 30 per cent; 3. if the arrangement of the present rate schedule is satisfactory and equitable, the simplest change is the application of a uniform percentage increase. With less satisfactory schedules, the change offers opportunity for removal of inequities.

NEED OF NATIONAL WATER POLICY

In his report to the Board of Direction of the American Society of Civil Engineers, Dean Thorndike Saville of the School of Engineering of New York University, states: "The National Water Conservation Conference, made up of state officials and representatives of various organizations throughout the United States interested in water conservation, adopted as its primary resolution: 'the situation requires that steps should be taken to explore the various facets of land and water use and control, including the extent of the undeveloped water resources of the nation; the existing federal, state and local laws and agencies charged with the development and control of water; the conflicts of jurisdiction, planning and execution existing among or between these laws and agencies; the effect upon the national economy, welfare and safety of existing laws, and the policies and activities of the agencies concerned; and the relation of these factors to other elements of the national economy such as industry, agriculture and commerce.'" The conference met at Kansas City, Mo., in Sept., 1947.

RESTORATION OF OXYGEN TO POLLUTED STREAMS

The paper industry, whose sulfite mills are notorious stream polluters, has instigated experiments on the Flambeau River (Wisconsin) on diffusing compressed air into the polluted stream, through carborundum pipes placed about 10 ft. below the water surface. The *Paper Trade Journal* (vol. 124, p. 12, 1947) states that the "process appears to be a useful tool in accelerating recovery of polluted stream and shortening to a considerable degree distance of passage required for oxidation of waste and serves to prevent anaerobic conditions and attending nuisance."

DROUGHTS

Crichtlow reported to N. J. Section of the American Water Works Association on Nov. 6, 1947, that the years 1939, 1941, and 1944 were drier than 1947, and the reservoirs were more depleted in those years. The disastrous forest fires in October 1947 at Bar Harbor and elsewhere were attributed to the unusual lack of rain. The scattering of dry ice (solidified carbon dioxide) by planes in the top of a cloud that extends upward into freezing levels, to cause rainfall, has appealed to people praying for rain. Dr. F. W. Reichelderfer, Chief of the Weather Bureau, is quoted in the *United States News* (Nov. 21, 1947) as saying that "under some conditions, rainfall will be caused—but conditions must be such as might have produced rainfall anyway"; he is proceeding with research. Dr. Reichelderfer thinks that, in the end, it will prove valuable in special situations, at least. Dry ice can turn the winter clouds at the top of southwestern mountains into heavy deposits of snow, which later becomes water, available for irrigation, in the streams below. Dry ice already has been used in Hawaii to drop rain on the pineapple fields, rain that otherwise might have fallen at sea.

A.W.W.A. COMMITTEE ON ROOFING RESERVOIRS

A preliminary report by N. J. Howard, Director of Water Purification, Toronto, Canada, discussed the answers to a questionnaire regarding roofs (*Water Works Engineering*, Aug. 20, 1947, p. 1014).

"There was considerable unanimity on the general objectives, but a wide variety when abstractly interpreted. Defects in open reservoirs include: (1) blowing in of dust, debris, ashes, cinders, soot, sprays, gases, and pollens; (2) defiling of water from fish flags, worms, plankton, fly larvae and decaying organic matter; (3) pollution from rodents, water fowl, land birds, domestic animals and wild animals; (4) illegal fishing; and (5) swimming by teen age pranksters. All of these cause pollution and water deterioration.

"Ground water reservoirs need to be covered to prevent rapid fouling with 'Beggiatoa' with hydrogen sulfide is present and other organisms with other substances, particularly iron, manganese, carbonates, nitrates and chloramines. Covering and screening of reservoirs is a 'must' to make storage a safe practice and the only excuse of not covering might be that a given reservoir is too large."

RE-USE OF WASTE WATERS FROM INDUSTRY

On this subject, *Public Works* (May 1947, p. 24), states:

"Re-use practice may be divided on the basis of first use into: (1) Re-use of process waters; (2) Re-use of water from cooling and heating circuits; and (3) re-use of sewage plant effluent.

"In all industrial plants, water is a real and sometimes substantial cost item. Therefore, consideration must be accorded to the possibilities of reclaiming sensible heat and usable materials as well as to the adequacy of supply when weighing the economic advisability of water re-use.

"In some areas, re-use of cooling water is mandatory by law. Seven states, Minnesota, Maryland, New Mexico, New York, Ohio, Utah and Wisconsin, control the use of water from both underground and surface sources. Regulation of water consumption can be enforced in four other states, Kansas, Massachusetts, North Carolina and North Dakota, when and if control is deemed desirable. Because all water entering the sanitary sewers at Miami Beach must be pumped, waste water flows exceeding 2 gpm. from air conditioning systems may not be discharged to the sanitary sewers. Therefore, water economy must be exercised.

"Compressor cooling water has been used as boiler water makeup. Similarly, cooling water from furnace grates has been utilized as boiler water makeup. Economies in heat, water, and water conditioning chemicals are realized from such operations.

"Occasionally, a collateral benefit results from recirculation through avoidance of 'heat' pollution of the stream. Le Bosque of the U. S. Public Health Service, has called attention to the fact that if stream temperature is raised sufficiently by discharge of heated waters, normal stream recovery from pollutional loads may be impaired. It has been reported that one steel mill using 500,000,000 gallons of water per year increases the temperature of the receiving stream to a peak of 130° F.

"The use of sewage plant effluent for various purposes is becoming increasingly ordinary. Such application includes: (1) use of sewage plant effluent by the plant itself in place of fresh water; (2) use after supplementary treatment for industrial purposes; and (3) use of sewage plant effluent for irrigation of crops in semi-arid regions.

"The outstanding example of employing sewage plant effluent as a substitute for industrial water is the Bethlehem Steel Company at Sparrows Point, Maryland. The water table of the underground supply from which the plant pumped 20 mgd. had receded from 10′ in 1898 to 150′ static level in 1940. Salt water contamination of this underground supply had also increased to serious proportions. After full study and investigation, the Bethlehem Steel Company negotiated an agreement with the City of Baltimore to purchase 20 to 40 mgd. of effluent from the Back River Municipal Sewage plant. Treatment of the sewage plant effluent comprises flash mixing of a coagulant, flocculation, sedimentation and chlorination. The use of the sewage plant effluent resulted in curtailing the rate of withdrawal from the plant's underground water resources from 15,000 gpm. to 3,500 gpm. and restored the water table to a level of 80′."

CONSUMER COMPLAINTS

According to the 1947 issue of *Water Works News of New York State,* issued by the State Department of Health, the chief complaints are: rates not justified by services rendered; lack of water, or low pressure, particularly in the lawn sprinkling season; tastes and odors, which the consumer ignorantly associates with pollution; in unfiltered upland supplies, debris, worms, larvae and small fish; staining of fixtures by iron and manganese; hardness, leading to rapid use of soap, and scale formation in hot water equipment; corrosiveness, which may shorten the life of hot water equipment by 80%, and which may produce red water.

LEGISLATION FORBIDDING STRIKES

Many states, including New Jersey, New York, Ohio, Texas and Virginia, now have on their statute books laws prohibiting strikes of public employees, and, in general, declaring such action by the civil employees to be "against the public policy." Upon signing the New York State bill which calls for automatic dismissal of striking public workers of the state and its political subdivisions, Governor Dewey is reported to have said that such strikes could lead to anarchy through a paralysis of government and of all society, and that the state can not permit such action and survive. Section 2 of the Ohio anti-strike bill (Ohio 97th General Assembly, S. B. No. 261) states: "No person . . . in the service of any authority, commission or board, or in any other branch of the public service . . . shall strike." President Ladue of the A.W.W.A. (*Journal,* A.W.W.A., Sept., 1947) holds that such legislation tends to regiment the civil service employee, and advocates a "forthright policy of management-worker relationship which will make anti-strike legislation inoperative by making it unnecessary."

LOW WATER DEMAND RATE FOR FPHA TENANTS

Fifty apartment units housing about 220 people in 13 FPHA buildings at Waukesha, Wis. are served through a single 2-inch meter from a 6-inch street main. A 7-day test (Feb. 25 to March 4, 1946) with recording chart showed a total flow of 61,240 gallons or an average rate of flow of 40 gallons per capita per day. The peak rate for 50 families was 18 gallons per minute, or 117 gallons per capita. Peaks occurred between 6:45 and 8:00 A.M., and 4:45 and 6:00 P.M. The minimum rate was 1.33 gpm. or 9 gallons per capita per day.

ATOMIC BOMB DAMAGE TO JAPANESE WATER WORKS

The United States Strategic Bombing Survey reports that the damage at Nagasaki was restricted to the breaking of the service pipes to practically all destroyed buildings, and at one river bridge crossing. Hiroshima is supplied largely from shallow water wells; in the bombed district, all shallow wells were rendered useless through clogging by debris, and heat damage to the pumps; in addition, there were 5,000 breaks in service pipes, and 17 breaks in the distribution system; the latter were in the nature of fractures to the cast-iron pipe where it had been laid on filled ground.

CONTROL OF TUBERCULATION

For many decades, manufacturers of cast-iron pipe have afforded the purchaser the opportunity of ordering pipe with cement lining, in lieu of the usual tar lining, in regions where tar linings have provided poor protection against tuberculation. Recently methods have been perfected, notably by Centriline Corporation and the Preload Co., for cleaning tuberculations out of old systems, and lining the clean pipes with cement. Thomas F. Wolfe, research engineer of the Cast Iron Pipe Research Association presents in the *Journal of the New England Water Works Association* (December 1946) the merits of cement lining:

"1. Cement linings after an eighty-year history indicate that they will prevent tuberculation.

"2. In supply lines, the high 'C' values that result from the use of cement linings result in economy due to lower pumping costs.

"3. The use of cement linings may make it possible to use smaller-diameter pipe, since the flow coefficient remains constant, as compared to a reduced capacity where ordinary pipe is used.

"4. With certain types of water cement lining mitigates tastes, odors and red-water troubles.

"5. Modern cement linings adhere to the wall of the pipe and are not injured by cutting or tapping."

Corrective treatment with lime to remove aggressive carbon dioxide has been successfully practiced at Baltimore since 1922. A film of calcium carbonate formed on the inner walls of pipes checks corrosion. It is not effective in hot water systems, since the carbonate ions resulting from the lime reaction are broken down by heat into carbon dioxide and calcium hydroxide. Maintenance of a pH value of 7.9 in the water for the past 16 years has served to produce a slight "egg-shell" precipitate of calcium carbonate in the distribution system. The cost of lime treatment has averaged $0.431 per million gallons, or 12 per cent of the treatment cost, over 25 years. This cost includes depreciation of equipment. (Edward S. Hopkins, *Public Works,* July 1947, p. 19.)

MODERN PUBLIC WATER SOFTENING

The first municipal lime-soda process was installed about 40 years ago, the zeolite process a few years later. While the early plants aimed at reducing the $CaCO_3$ hardness to about

10 grains per gallon (178 gpm.), modern plants try for 3 to 5 grains. *Water and Sewage Works* (Dec. 1946, pp. 485-90) states:

"The development of the sludge-contact reactor was a considerable step forward to render the cold lime-soda treated water more stable. The contact with large quantities of previously accumulated precipitates stimulated rapidity and completeness of reaction. This is the modern unit employed in Cold Lime-Soda treatment today. It accomplished, in less than one hour, results equal or superior to those obtained with the old-fashioned continuous unit using four or more hours' retention. Chemicals are saved and a more stable water is produced. So stable is the treated water that some have called these sludge-contact reactors 'Stabilizers.'

"The Sodium Zeolite Process is one of the most efficient methods of water softening. Essentially it comprises a container having a bed of the zeolite or sodium cation exchange material, supported on gravel or anthrafilt, below which is an efficient collection or underdrain system. As the water passes downward through the sodium zeolite, the calcium and magnesium cations in the water are exchanged for the sodium of the zeolite.

"In addition to sodium zeolite, there are now available two other methods, namely, Hydrogen Zeolite and Demineralizing."

DYNAMICS OF WATER CHLORINATION

Prof. Gordon M. Fair told the New England Water Works Association that the complete study "of the disinfection of water supply by chlorine or any other chemical agents involved many factors." Among these he mentioned: "1. The nature of the organisms to be destroyed and their possible concentration in water supply; 2. time of contact between the disinfectant and the organisms; 3. the concentration and constitution of the chemical agent or agents liberated in the water; 4. the temperature of the water; 5. the concentration and composition of the impurities present in the water to be disinfected. . . ."

While there is a long history of the use of chlorine and its compounds for water disinfecting purposes, it was noted that it was not surprising that all of the significant factors are not as yet satisfactorily understood in the chlorination of waters.

Studies of the dynamics of the disinfection process are of fundamental importance in paving the way for more reliable sanitary control of water supplies. Only by a thorough knowledge of the basic factors affecting the destruction of pathogens can disinfection be converted from a trial and error procedure to sound scientific practice. As further information is gained as to how and why organisms are destroyed, the way may be opened to the discovery of new and more efficient disinfecting materials.

THE OZONE PROCESS

This process has been used in Europe for over 40 years but for some reason has never received general acceptance in this country. Before the war there were some 120 ozone plants in use on the water supplies in France, the largest being on the supply for Paris, where a plant capable of handling 79 m.g.d. was in operation. In this country, three Indiana communities, Hobart, Whiting and Long Beach, have plants, one of which has been in operation for 15 years. At the present time, studies are being made for a plant to be installed in Philadelphia.

Ozone, the second most powerful oxidizing agent known, is a gas which can not be stored and must be used as generated. Ozone Processes, Inc. uses air and electricity to generate the ozone. Control is very simple, as the dosage can be varied by changing the voltage or by changing the number of generators in operation. Any over-dose is self-dissipated and with an under-dose, protection and treatment are provided in proportion to the amount applied. Ozone residuals can not be carried out into the distribution system but ozone can be used in conjunction with chlorine and very definitely reduces the chlorine demand.

A comparison of the cost of the ozone process with the cost of chlorination shows the ozone treatment to be very expensive, both from an operating and installation point of view. At present, installing the ozone process costs between $10,000 and $25,000 for each million gallons of plant capacity, and the operating costs are about two to three dollars per million gallons. Operating costs are made up almost entirely of power costs, and the above figures are based on electricity at one cent per kwh.

One of the principal advantages of this type of treatment is that tastes, odors, and color can be removed without a filtration plant.

WATER QUALITY LITIGATION

Alleged harmful chemicals in a public water supply were the subject of recent litigation before the Supreme Court of Ontario (*William E. Holder v. Windsor Utilities Commission*).

The plaintiff claimed that he was suing on behalf of himself and all other water users for damages resulting from the action of the commission in treating the water supply by adding harmful chemicals. No stated damages were asked. He stated that he had been in good health when he came to Windsor six years before, but that he had contracted hepatitis and other illnesses there. On inquiry he found that the city was using aluminum sulfate and ammonium sulfate in its water supplies. He complained to the Water Commission, to the government at Ottawa, and to the Provincial Department of Health at Toronto, but no action had been taken. When he discontinued use of the Windsor water and used distilled water, he became well again.

A. E. Berry of the Ontario Department of Health testified that the water in question is treated with aluminum sulfate at the rate of 25 ppm (250 is generally recognized as the maximum for suitability for domestic purposes) and the alum does not pass through the filters.

In giving his decision, Mr. Justice Barlow stated that the case was a most extraordinary one. He stated that the plaintiff had presented no evidence of damage. He found, from the evidence, that the water was of first class quality, effectively supervised and properly inspected by the Provincial Department of Health. He therefore dismissed the action with costs to the plaintiff. (See *Journal of A.W.W.A.*, June 1947, p. 529.)

DE-AERATOR FOR COLD-WATER SYSTEMS

A cold-water de-aerator, designed to protect piping and equipment from corrosion, has been developed by the Cochrane Corporation, Philadelphia, Pa. By reducing oxygen and carbon dioxide to low limits, the product is said to preserve the life and carrying capacity of cylinder jackets and heat exchangers in situations where the carbon dioxide content of raw water would make oxygen corrosion appreciable.

CATHODIC PROTECTION OF STEEL HOT-WATER TANKS

Experimental studies on the life of galvanized steel electric water-heater tanks, conducted by the Westinghouse Electric Corporation, Pittsburgh, Pa., reveal that, in some small areas served by different water systems, some tanks will outlast others. According to the investigators, this difference seems to lie in the lack of lime or carbonates in water, which partially protects the tank wall from corrosion.

It is reported that favorable results have been obtained experimentally by suspending inside the tank a magnesium-alloy electrode electrically grounded to the tank. In this arrangement, it is said that galvanic currents are such that ions flow away from the magnesium electrode instead of the tank wall, thus destroying the magnesium instead of the zinc. When the electrode is well disintegrated, it must be replaced.

The cathodic protection of water

tanks and pipelines has been successfully carried out by several water departments and industries. The application of the principle in domestic water heater tanks protection, although showing favorable results, is reported to be still in the experimental stage. (*Water Works Engineering*, March 5, 1947, p. 246.)

HOT-WATER TANK EXPLOSIONS

A domestic hot-water storage tank is safe against rupture only when operated at pressures not in excess of the manufacturer's rating. It is safe against explosion only when operated at temperatures below 212° F.

Pressure, as related to the explosion of a hot water storage tank, is merely contributory. Without pressure there can not be excessive temperature (temperature in excess of 212°). If the water is not under pressure, it will boil away to atmosphere when the temperature is raised to 212° F.

Pressure in excess of the strength of a tank will cause a rupture at the weakest point, allowing water to run out. If the water temperature is below 212°, a stream of water will be discharged from the tank, causing probable water damage to property.

If, however, the water is overheated when a rupture occurs, part of the escaping water will flash into steam. The high velocity, imparted by the tremendous expansion of the water when changing into steam, may tear the tank apart and an explosion will immediately follow. The higher the temperature above 212°, the greater will be the energy liberated and the more damaging the explosion. (See *News-Letter,* American Society of Sanitary Engineering, May 1947.)

STREET AND HIGHWAY TRAFFIC

By Burton W. Marsh and LeVerne Johnson
American Automobile Association

GENERAL

Again in 1947, America's performance in providing for highway transportation needs proved inadequate to meet the ever-increasing demand. The importance level at which we, as a people, hold highway transportation has still not been placed on the high plane where it belongs in view of the extent to which it affects our lives. One in seven persons in the United States are said to obtain their livelihood directly or indirectly as a result of highway transportation. There are few people whose economic or social status is not affected. Progress in 1947 has been sporadic, but there have been a number of significant and encouraging developments.

NATIONAL SYSTEM OF INTERSTATE HIGHWAYS DESIGNATED

The National System of Interstate Highways, as provided for in the Federal Aid Highway Act of 1944, was designated in August 1947 jointly by the U. S. Public Roads Administration and the state highway departments. It contains 37,681 miles of the nation's major highways, including 2,882 miles of urban thoroughfares. Additional circumferential and distributing routes are to be designated later, and 2,319 miles have been reserved for these routes. The 1944 act limits the interstate system to 40,000 miles. It is significant that this system makes up approximately one per cent of all rural roads but it will carry some 20 per cent of the nation's motor vehicle traffic.

While the Federal Aid Highway Act of 1944 authorized the appropriation of $500,000,000 for each of the first three post-war fiscal years to help states improve and expand their highway systems, no specific sum was provided for the interstate system. There are some who believe that such a specific sum should have been earmarked, or that the system should receive some preferential treatment to implement and speed up progress on it.

STATE HIGHWAY STUDY COMMITTEES CREATED

Special committees were set up or were already functioning in 14 states during 1947 to make comprehensive studies of highway needs, highway revenues, costs for moderately long-range improvement programs, equitable allocation among beneficiaries of taxes required therefor, and a priority program of construction from year to year. Such committees are usually made up of representatives of state legislatures and responsible lay citizens, and are mostly publicly financed. Of the above 14 states having such committees, 13 included legislators and were financed with state funds.

Such highway study committees can accomplish much in securing sound highway policies, plans, and programs. They can also do much to bring about a desirable degree of unification and coordination of the administration of county (local) roads, city streets, and state highways, now in the hands of some 35,600 agencies throughout the country having highway responsibilities. In most states, laws governing highway administration, taxation, and fund distribution are obsolete. Study committee reports have served as useful guides in the preparation of improved legislation. California's officially adopted 15-year state highway program, for example, was based on studies made by such a study committee known popularly as the Collier Committee. (The latter was described in THE AMERICAN YEAR BOOK for 1946.)

CONSTRUCTION UNDER FEDERAL AID INCREASED

Reports by the U. S. Public Roads Administration for the 1947 fiscal year, ended June 30, show that, during the year, 7,929 miles of highway of all classes involving Federal-aid were completed, as compared with 2,964 miles in 1946 and 12,936 in 1941. Completed highways included 2,991 miles on the Federal-aid system, 4,609 miles of secondary and feeder roads, and 329 miles in Federal areas and miscellaneous construction. Cost of projects completed on the Federal-aid system was $142,965,296, and completed secondary roads cost $55,334,860.

Retarded principally by manpower and materials shortages and high costs, highway construction lagged far behind plans. The Public Roads Administration approved for Federal financial participation projects amounting to $932,362,226 for 24,720 miles of highways. Actual Federal payments to states for work done amounted to $193,634,155. The total of all highway construction contracts awarded, involving both state and Federal funds amounted to $817,742,000 for 47,163 miles of road.

PERIOD OF FEDERAL-AID FUND USE EXTENDED

Under the Federal Aid Act of 1944, Federal funds were usable during the year for which appropriated and for one additional year. Because of delays mentioned above, Congress enacted legislation during 1947 granting an additional year for the availability of Federal funds under the 1944 act. Hence, funds allocated to states under that act will not lapse for two years following the year for which they are authorized.

LEGISLATURES ACTIVE ON TRANSPORTATION MATTERS

The National Highway Users Conference estimated that some 10,000 bills affecting highway transportation were introduced in the legislatures of 44 states during 1947. The remaining four did not meet. The most significant trends involved pressure for increased highway user revenues, more dispersion of highway revenues to lesser roads and city streets, toll road developments, and the establishment of highway study committees. The last-named has already been discussed.

Increases in gasoline tax rates were proposed in 35 states, according to an American Automobile Association report, and the following increases were adopted in eight: namely, California (1½¢ to 4½¢), Colorado (2¢ to 6¢), Connecticut (1¢ to 4¢), District of Columbia (1¢ to 4¢), Maine (2¢ to 6¢), Maryland (1¢ to 5¢), Rhode Island (1¢ to 4¢), and Vermont (½¢ to 4½¢). Of these increases, those in Colorado, Maine, and the District of Columbia were enacted as temporary, while existing temporary taxes in New York were made permanent, and temporary taxes in Florida, Idaho, Ohio, Pennsylvania, and West Virginia were extended for two-year periods.

The trend toward increased sharing of state highway funds with counties and cities for use on local roads and streets has become marked in many states. Several states listed above as having increased their gasoline tax rates provide by law that large shares of such increases be distributed among counties and cities. In Colorado, 50 per cent of the two-cent increase is allocated to state highways, 44 per cent for county roads, and six per cent for local city streets. Maryland's new distribution system, including a one-cent increase, is: Baltimore, 30 per cent; counties and other municipalities, 20 per cent; and state highways, 50 per cent.

ANTI-DIVERSION ACTIVITY

Activity designed to reduce the diversion of highway user revenues to non-highway purposes continued during 1947. Twenty states have now adopted anti-diversion amendments to their constitutions, an addition of one (Ohio) during 1947. In addition the legislatures of Tennessee, Massachusetts, and Florida approved amendments which are now to be submitted to a vote of the people at the next general election.

In several states, laws were enacted restricting to highway purposes the expenditure of revenues which formerly were diverted, as follows: California, the motor carrier gross receipts tax; Nebraska, one cent of gasoline tax; Maryland, two per cent certificate of title tax; and New Mexico reduced diversion to registration fees from 15 to 10 per cent. North Carolina and Wisconsin segregated all highway user tax revenues. Illinois enacted a statute which prevents diversion. Hence, the amount of diversion throughout the nation as a whole is being reduced. From a peak of $215,000,000 diverted to non-highway purposes in 1941, diversion was reduced to $95,000,000 in 1946. The increased need for use of highway funds for needed road purposes is bringing this about through state constitutional amendments and suitable statutes.

TOLL ROAD LEGISLATION

Some highway-interested organizations consider the spread of toll roads as the outstanding danger signal of the 1947 legislative session. Statutory authority for the construction of new toll roads was granted in five states—Colorado, Georgia, New Hampshire, Oklahoma, and West Virginia—under various administrative and financing plans. In addition, California, Maryland, New York, and Pennsylvania enacted legislation generally extending the authority to collect tolls. Toll road legislation was defeated in Connecticut, Florida, Ohio, and Washington.

TRAFFIC VOLUME INCREASE

With motor vehicle registration at an estimated 37,164,405 and up 9.5 per cent from 1946, traffic volumes for 1947 reached an all-time high. (Estimates from U. S. Public Roads Administration figures which are based on data from 600 to 700 automatic traffic counters in operation throughout the country by state and local highway authorities.) Early estimates show that each vehicle traveled some 10.000 miles, for a total of some 370.000,000.000 vehicle-miles for the nation as a whole.

Traffic on main roads for each

month in 1947 exceeded corresponding months of 1946 from five to nearly 13 per cent. Vehicle-mileages on local roads for 1947 exceeded 1946 by from 1.5 to over 10 per cent each month, while comparative figures for city streets showed monthly increases of from three to nearly nine per cent.

HIGHWAY ENGINEERING PERSONNEL SHORTAGE

One of the most serious shortages affecting progress in highway work is in engineering personnel, largely because of the inability of highway administrators to pay salaries which are being paid by other organizations. The American Association of State Highway Officials first took action concerning this salary and personnel situation in 1946 when it appointed a special Committee on Salaries and Wages in Highway Departments. In the interim report of this committee late in 1946 it was recommended that the Highway Research Board's Committee on Highway Organization and Administration take over this work since it had already begun exploratory investigations. This was done, and the Highway Research Board released in December 1947, *Bulletin No. 9* entitled "Salary and Wage Practices of State Highway Departments."

The report is far too detailed to cover here. It highlights the very serious shortage of trained and experienced technical personnel. For example, as of July 1, 1947, "there were in the 48 highway departments approximately 9,800 unfilled engineering positions. . . ." It also emphasizes that there are some 25,000 to 30,000 potential civil engineers enrolled in colleges and universities but that there is doubt if many of them can be attracted to employment in state highway departments principally because of "low salaries and ineffective recruiting procedures."

UNIFORMITY OF TRAFFIC LAWS

Co-ordinating work on the Uniform Vehicle Code, Model Traffic Ordinance and the Manual on Uniform Traffic Control Devices was taken over by the National Committee on Uniform Traffic Laws and Ordinances, an organization formed during 1947 upon the termination of the National Conference on Street and Highway Safety.

Gratifying progress was made during 1947 in the amendment of motor vehicle laws to conform more closely with recommended model legislation. Florida, North Carolina, Washington, and Wyoming amended their certificate of title laws to conform more closely with Act I of the Code. Montana and Wyoming enacted new operators license laws substantially in conformity with the Code, leaving South Dakota as the only state not requiring a driver's license. A number of other states amended existing driver's license laws generally toward more comprehensive examinations.

Texas adopted substantially all of Act V of the Code, which is the "Uniform Act Regulating Traffic on Highways." At least 13 other states made revisions in their traffic statutes. Florida, New Mexico, and Wyoming adopted new financial responsibility laws conforming essentially with Act IV of the Code.

Important changes in laws with regard to vehicle sizes and weights were adopted in some 22 states, in general permitting increases. At least five states amended their laws to permit the use of reflectors in lieu of flares and fuses by trucks making emergency stops on highways at night.

Much of the above information comes from a new bulletin, entitled "Uniform Laws," issued in 1947 as the first of a series by the National Highway Users Conference.

New and improved standards for traffic signs, signals, markings, and islands, embodied in the new "Manual on Uniform Traffic Control Devices," reported in these pages in 1946 as substantially completed, were put in final form during 1947 and approved by the various organizations involved. A mimeographed manual is now available in limited supply. The printed manual is to be available soon.

TRAFFIC AND PEDESTRIAN SAFETY CONTESTS

Activities in connection with the National Traffic Safety Contest, sponsored by the National Safety Council, and the National Pedestrian Protection Contest, sponsored by the American Automobile Association, were expanded at the request of the President's Highway Safety Conference to include the assembly and analysis of factual information to serve as the basis for proposed annual reports of progress to the President's Conference.

TRAFFIC ENGINEERING ADVANCES AS A PROFESSION

Traffic engineering as a profession and as a recognized branch of engineering, has been slowly gaining acceptance through the years with much credit due to the vision of the founders and charter members of the Institute of Traffic Engineers. A milestone in the Institute's progress was marked in 1947 with the employment of its first full-time executive secretary, and a national headquarters was established on the campus of Yale University.

Membership in the Institute of Traffic Engineers at the close of 1947 totaled 377, an increase of 29 over the previous year. A complete revision of the *Traffic Engineering Handbook*, originally published jointly by the Institute and the National Conservation Bureau in 1941, and which has taken its place among other technical handbooks used by practicing engineers, was undertaken by leading traffic engineers during 1947.

Recognizing the serious shortage of trained traffic technicians, the Institute of Traffic Engineers made plans for co-sponsoring four traffic engineering short courses in cooperation with engineering colleges. The first such course was scheduled for January 1948 at the University of Minnesota. Institute headquarters frequently circularizes among members, lists of job vacancies, and maintains a confidential list of members seeking new positions. In spite of this service, many traffic engineering positions remain unfilled.

An important guidebook on "Street and Highway Traffic Engineering Functions and Administration" was completed during 1947 by a joint committee of the American Association of State Highway Officials, the American Public Works Association and the Institute of Traffic Engineers. It covers the broad subjects of traffic facts and trends, traffic operations, traffic design, and traffic administration, and will be available in printed form in 1948.

EMPHASIS ON CITY PARKING PROBLEM CONTINUES

Where to park in cities is one of the most perplexing of all urban traffic problems. To a greater extent than ever before, with rapidly increasing automobile registration and use, traffic and other public officials and community leaders have come to realize that, if central business districts of cities are to thrive as centers about which trade and community life revolve, the parking problem must be solved. Perhaps the most controversial issue is whether the provision of parking facilities should be the responsibility of the municipality or of private enterprise.

Some encouraging progress was made in 1947 through the establishment of special parking agencies in some cities, numerous special parking studies conducted cooperatively by the U. S. Public Roads Administration, state and local officials, and through legislative action in a number of states.

Parking authorities, commissions, or special quasi-public agencies have been set up in at least the following cities, and a number of other cities have plans under consideration: Pittsburgh, Pa.; Richmond, Va.; White Plains, N. Y.; Beloit, Wis.; Grand Rapids, Mich.

Comprehensive parking surveys were approved and field work started in 15 municipalities under cooperative arrangements among city, state, and Federal officials. A number of other surveys on parking were conducted independently by cities, and advisory service was extended to numerous cities by the Automotive Safety Foundation, the National Conservation Bureau, and the American Automobile Association and other agencies.

The American Automobile Association, as a follow-up on the publication of its "Parking Manual" in 1946, began issuing in 1947 periodic bulletins on parking to AAA Clubs, public and civic leaders. The Highway Research Board, Automotive Safety Foundation, Eno Foundation for Highway Traffic Control, and other organizations also issued valuable parking materials.

SAFETY EDUCATION ACTIVITIES EXPANDED

It is generally agreed among traffic safety educational leaders that the most hopeful and outstanding progress of the year was made in the institution of driver education and training courses in high schools. In its 1947 report, the Committee on Education of the President's Highway Safety Conference said: "There is every indication that the schools are accepting their responsibility for this phase of education and are approaching the problem with increased interest and enthusiasm."

The American Automobile Association enlarged its program very extensively in 1947. Through cooperative arrangements with manufacturers and local dealers, the Association and its affiliated Clubs placed over 900 dual-control-equipped driver training cars in high schools meeting the requirements that there be employed a properly trained instructor and that the car be used a certain number of class periods per week. AAA educational consultants trained some 1,500 teachers in driving instruction techniques during the year, bringing the total for the past 11 years to over 7,000.

The Center for Safety Education, New York University, conducted approximately 40 programs in teacher training and safety and driver education, varying from one- and three-day conferences to full semester courses at the University. The short courses were held in cooperation with colleges and universities throughout the country. The Center also participated in 15 of the 34 fleet supervisor courses sponsored by the National Committee on Fleet Supervisor Training.

A new California law requires that the "State Board of Education . . . adopt rules and regulations for the establishment of courses of instruction in automobile driving and driver training in secondary schools." Illinois amended its school code to provide that "the curriculum in all public schools must include a course dealing with the content of the Illinois traffic laws." Pennsylvania not only authorizes any school district to provide for the teaching of "safe driving" in elementary and secondary schools, but "authorizes the Board of School Directors to purchase, rent or hire motor vehicles for such instruction." Courses are limited to classroom instruction for pupils under 16 years of age. Action by the Delaware Legislature in 1947 placed the statewide driver education and training program under the State Department of Public Instruction, appropriated $50,000 to continue and improve the program, and added a new assistant superintendent of driver education to the department staff.

An important new project in general adult traffic safety education was instituted during 1947 by the National Safety Council in what the Council termed "Operation Safety." The plan involves the selection of 12 monthly themes and the preparation of a planning guide and kit of materials for each month. Distribution is made each month to a number of educational groups, safety councils, civic groups, and public officials.

TRAFFIC POLICE TRAINING

The Northwestern University Traffic Institute continued to hold its two four-month courses in traffic police training, as well as a number of in-service short courses. In-service short courses were also held at a number of colleges and universities, including the Pennsylvania State College, University of Iowa, and National Institute for Traffic Training held in 1947 at the Georgia School of Technology.

The Federal Bureau of Investigation continued during 1947 to include substantial amounts of traffic law enforcement training in connection with its National Police Academy, held three times during the year.

SCHOOL BUS TRANSPORTATION PROGRESS

There were a number of tangible evidences of progress in school bus transportation during 1947. About 50 per cent of the states have either adopted, or followed closely, National School Bus Standards and at the close of 1947, over half of the states had transportation supervisors responsible for a state bus transportation program. According to reports to the President's Highway Safety Conference, at least 11 states now have organized driver training institutes which bus drivers are required to attend annually.

Design standards for a new type of "Stop-Arm" semiphore were proposed during 1947 to the National Committee on Uniform Traffic Laws and Ordinances for inclusion in the Uniform Vehicle Code, but action has not yet been taken.

NATIONAL INSTITUTE FOR TRAFFIC TRAINING

Again in 1947, the National Institute for Traffic Training was held under the sponsorship of 12 traffic-and-safety-interested organizations. A newly organized National Committee for Traffic Training, membership made up from sponsoring organizations, was directly responsible for planning and directing the 1947 Institute held at the Georgia School of Technology. Courses offered included traffic police operations, driver education and training, pedestrian protection, school transportation, traffic engineering, and driver licensing.

TRAFFIC AND HIGHWAY RESEARCH

Research in highway transportation has always lagged behind needs, not because traffic and highway administrators failed to see the needs, but usually because there were insufficient funds and personnel. Moreover, administrators and their staffs are usually so busy getting seemingly more urgent jobs done that there is little time remaining for research. In spite of these shortcomings, however, some encouraging progress was made during 1947.

The Research Committee of the Institute of Traffic Engineers made a step forward through the compilation of an exhaustive list of needed researches in cooperation with the Committee on Planning and Traffic Engineering of the American Association of State Highway Officials. The ITE committee also made a survey of organizations best fitted to conduct certain researches, for the ultimate purpose of seeking to avoid duplication wherever possible. The list of researches, which is to be expanded and set up on a priority basis, includes over 80 possible subjects for investigation. The Department of Traffic and Operations of the Highway Research Board also maintains an extensive list of needed traffic researches.

The Bureau of Highway Traffic, Yale University, continued during 1947 its program of courses involving traffic engineering training and research. Each student is required to develop a report or thesis based on a research study having original value in highway traffic. In addition to student research, a member of the Bureau staff was assigned in 1947 to a special investigation on garage design, operating characteristics, etc.

The National Safety Council's Committee on Winter Driving Hazards continued its investigations of skidding characteristics on ice and snow, with particular emphasis during the 1947 tests on stopping heavy vehicles. Results of the researches are published in the Committee's report on "Winter Accident Prevention."

A wide variety of research results were reported at the annual meeting of the Highway Research Board in 1947 by Federal, state and local highway transportation leaders, covering such broad subjects as highway design, parking, roadside development, and control of access, maintenance, land acquisition, construction, soils and subgrades, and economics, finance and administration.

In the field of traffic safety research, one of the highlights of 1947 was the establishment by the American Automobile Association of the "AAA Foundation for Traffic Safety." The Foundation will concentrate much of its attention on educational activities in the safety field, including the institution of driver training programs in high schools throughout the nation. It will produce various types of safety materials and will engage in research and experimentation to test the effectiveness of various safety programs.

The Highway Research Board continued during 1947 its Highway Research Correlation Service, which is designed to disseminate research information among highway-interested organizations and individuals. One of its effects is to reduce the lag between important research findings and their practical application.

Another significant development in the field of research in 1947 was the announcement in December of a grant of $15,000 by the Alfred P. Sloan Foundation to the Yale Bureau of Highway Traffic for a special study of "relationships, policies and technical practices of state and local agencies concerned with traffic administration. The study will attempt to analyze and evaluate currently used engineering techniques." The grant will be administered by the Automotive Safety Foundation.

TRAFFIC PUBLICATIONS

Space does not permit a complete listing of all of the important highway and traffic publications published in 1947. However, the following will indicate the caliber and diversity of the subjects:

Uses of Traffic Accident Records is a 187-page manual published by the Eno Foundation for Highway Traffic Control and produced by the Committee on Uses of Developed Information of the National Conference on Uniform Traffic Accident Statistics. The manual is designed to point the way to better use of accident statistics by engineers, educators, enforcement officials, and others.

Traffic Quarterly is a new journal published in January 1947 by the Eno Foundation. It contains a limited number of high-caliber articles on general traffic and highway matters, and is published four times annually.

A Selected Bibliography on Highway Safety was published in 1947 by the Highway Research Board at the request of the National Committee for Traffic Safety. The bibliography covers not only highway safety, but such related matters as highway design, facilitation, etc.

The Principles of Traffic Law Enforcement is a 350-page book published by the Northwestern University Traffic Institute covering the basic requirements for sound traffic policing and principles governing traffic police performance.

"Traffic Performance at Urban Street Intersections" is the first of a series of technical bulletins published by the Bureau of Highway Traffic, Yale University. This first bulletin covers such technical phases of intersection control as time-space relationships between vehicles, acceleration, deceleration, driver reaction time, and demonstrates the application of the Poisson Theory to vehicular traffic patterns.

"Your City Is Your Business," published by the Chamber of Commerce of the United States, is a 223-page report on the Businessmen's Conference on Urban Problems held under the Chamber's sponsorship in September 1947. The report covers such subjects of interest to urban communities as planning, traffic congestion, off-street parking, and rebuilding blighted areas.

DIVISION IX

DEFENSE AND ARMAMENT

THE UNITED STATES ARMY

By Robert S. Thomas
Military Historian, Historical Division, Special Staff,
United States Army

NEW UNIFIED DEFENSE SYSTEM

The calendar year 1947 emphasized two important military trends—an urgent campaign for the achievement of universal military training and, secondly, a complete reconstruction, by merger, of the United States military organization.

On July 26, 1947, General Dwight D. Eisenhower, Chief of Staff, dispatched this message to Army commanders throughout the world: "The President has signed the National Security Act of 1947 and Unification of the Armed Forces will soon be an established fact. This measure is designed to integrate our military forces —Army, Navy, and Air Force—into a coordinated fighting team. It is incumbent upon all ranks to accept and practice unification in spirit and in action as a patriotic duty. We of the Army must do our full part to insure the success of this legislation and demonstrate that it results in greater unification as opposed to separation . . ." The Act provided for the creation of a new organization, the Department of Defense, with a Secretary of Defense invested with Cabinet rank. It was originally provided that the provisions of the Act would be effective ". . . the day after the day upon which the Secretary of Defense takes office or 24 September 1947 in the event he does not take office prior to this date."

However, in a surprise move, President Truman, in a radio message from the battleship *Missouri,* homeward bound from Rio de Janeiro, gave orders for an earlier implementing date and, on Sept. 17, 1947, former Secretary of the Navy, James V. Forrestal, was sworn in as Secretary of Defense. On the following day, the process of shaping the nation's new unified defense system continued with the swearing in of the other top officials in the organization.

John L. Sullivan, who had been Under Secretary of the Navy, became Navy Secretary; W. Stuart Symington, who had been Assistant Secretary of War for Air became Secretary of the new Department of the Air Force; Kenneth C. Royall, who had moved up from the position of Under Secretary of War to Secretary of War on July 24, 1947 when Robert P. Patterson resigned, became Secretary of the Army; Major General William H. Draper, Jr., served as Under Secretary of the Army and Gordon Gray as Assistant Secretary of the Army.

Interior administrative officers in the Army were: General Dwight D. Eisenhower, Chief of Staff (to be succeeded by General Omar Bradley); General Jacob L. Devers, in command of Army Ground Forces; General Carl Spaatz, in command of Army Air Forces. The new Deputy Chief of Staff, appointed in July, is Lieutenant General J. Lawton Collins. American forces overseas dropped the title of "Commands" and were named and commanded as follows: General

Lucius D. Clay, Headquarters U. S. Army, Europe; Lieutenant General Willis D. Crittenberger, Headquarters U. S. Army, Caribbean, absorbing the former Panama Canal and Antilles Departments, ground forces in Puerto, Virgin Islands, and leased bases in the West Indies and British Guiana; General Douglas MacArthur, Headquarters U. S. Army, Far East; Major General H. A. Craig, Headquarters U. S. Army, Alaska (including the Aleutian Chain); Lieutenant General John E. Hull, Headquarters U. S. Army, Pacific; Major General Lawrence C. Jaynes, Headquarters U. S. Army, Mediterranean; Major General Bryant E. Moore, Headquarters U. S. Army, Trieste; and Lieutenant General Geoffrey Keyes, Headquarters U. S. Army, Austria. The Hawaiian Department, labeled obsolete, passed out of existence without establishment of a successor headquarters.

Within the Office, Chief of Staff, Division heads were: Major General Willard S. Paul, Personnel and Administration; Major General Stephen J. Chamberlin, Intelligence; Lieutenant General Charles P. Hall, Organization and Training; Lieutenant General Le Roy Lutes, Service, Supply, and Procurement; Major General Lauris Norstad, Plans and Operations (succeeded by Lieutenant General Albert C. Wedemeyer); Major General Henry S. Aurand, Research and Development. In December, the six staff divisions were reduced to five. This was done, by redesignating the Research and Development Division as the Research and Development Group of the Service, Supply and Procurement Division of the General Staff.

Chiefs of the several arms and services were: Major General Edward F. Witsell, Adjutant General's Department; Major General Ira T. Wyche, Inspector General's Department; Major General Thomas B. Larkin, Quartermaster General's Department; Major General Everett S. Hughes, Ordnance Department; Major General W. H. Kasten, Chief of Finance; Major General Raymond W. Bliss, Surgeon General; Lieutenant General Raymond A. Wheeler, Chief of Engineers; Major General Spencer B. Akin, Chief Signal Officer; Major General Alden H. Waitt, Chief of Chemical Warfare Service; Major General Thomas H. Green, Judge Advocate General; Major General Luther D. Miller, Chief of Chaplains; Major General Kenneth F. Cramer, Chief of National Guard Bureau.

UNIVERSAL MILITARY TRAINING

On May 29, 1947, President Truman received the report of his Advisory Commission on Universal Training, headed by Dr. Karl T. Compton, president of the Massachusetts Institute of Technology. Among other items, this Commission's report stated: "Never again will our Nation have months of relative immunity after the outbreak of war to mobilize, train, and equip an effective fighting force. Our preparation must be such that we can stand alone from the very beginning of the attack—and win." To emphasize our critical military position, the Compton Report stated: "The Army that fought with such power against Germany and Japan has been dismantled. Virtually all of what is left is assigned to occupation duty in the defeated countries. At a time when war can strike without warning, and with devastating force, our ground forces have only 2⅓ full combat divisions available for duty. Our air and sea strength is somewhat more formidable, but is dwindling so rapidly that it cannot long be considered a shield against possible attack."

To correct this situation, the Compton Commission, with the approval of President Truman, recommended a corrective program which should include, "(1) a strong, healthy, educated population; (2) a coordinated intelligence service; (3) scientific research and development; (4) industrial mobilization and stockpiling; (5) balanced armed forces; and (6) universal training. The armed forces would embrace: First—A mobile striking force, relying heavily on air power; second—A coordinated Army, Air Force, and Navy, including Marines, capable of undertaking an immediate campaign for strategic bases anywhere in the world."

Here, then, was the most compact national security program ever presented to our people. One of the recommendations, that for a coordinated, merged force, has already been translated into fact. The plea for universal training has been emphasized throughout our territorial bounds in every way—in the press, in speeches before assemblies of patriotic organizations, and by means of the radio. Among the many presentations, was that of Lieutenant General Raymond S. McLain, speaking at a National Guard Day celebration at Dallas, Tex., on Oct. 18. He said, in part: "The world has shrunk to a neighborhood. You can go to Japan, spend a day in Tokyo, and be back here [Dallas] for dinner next Sunday. . . . There are no longer any land barriers, ocean barriers, or air barriers to separate people and nations. Air power has added the third dimension to war. Amphibious operations have made the oceans into broad highways. There is no greater problem facing the American people today than the establishment of an adequate military policy to protect us in this kind of a world. . . . The security of this Nation cannot rest on one weapon alone nor on one assumption alone. Neither can our military policy be so fragile that human error or surprise attack such as that at Pearl Harbor can disrupt it. . . . When war comes, retaliation must be immediate. . . . Why not increase the National Guard and Organized Reserves? . . . [They] have performed magnificently. But the problem is beyond them as they are now organized. . . . It is obvious that with war moving at the speed it does, the National Guard cannot fulfill its training mission or its M-Day mission under a system which provides less than 200 hours a year of armory and summer camp training. Any national defense plan based on such an assumption is, of course, unrealistic and erroneous. . . . However, given recruits who have had 1,000 hours of basic training, it could then proceed with refresher training and higher team training. . . . Universal Military Training would provide the National Guard with this basically trained manpower . . . we are the only major power without it. Of 44 members of the United Nations in 1946, thirty-eight had compulsory military service . . . one has a compulsory militia. . . . In total war, the staying power of an army, or a navy, or an air force, and ultimate victory, is in its reserves and in the time these reserves can be brought to bear and the manner in which their efforts are synchronized . . . We cannot get these reserves . . . cannot even rebuild the National Guard at its present authorized strength of around 700,000 men . . . without Universal Military Training. Nor, back of the National Guard and the Organized Reserves, can we without Universal Military Training provide and maintain a pool of trained men in the unorganized reserves on which to draw in wartime. Universal Military Training is thus the foundation for our present military manpower planning. Without it, there would be no effective reserves when needed most nor trained replacements for the regular forces. . . . Without Universal Military Training we could also have a series of new Bataans all over the world. . . . Universal Training as described in the Compton Commission Report is essentially American and democratic. It is built on the equality of all Americans to defend their country, for, in the end, that means to defend themselves. . . . We must quit making irresponsible statements and deliberate misrepresentations to our youth . . . that they are 'not raised to be soldiers,' that war is outmoded, that civilization has discarded war as a means of settling disputes between peoples and nations. We have deceived them in the past and there are people who are deceiving them now. When war has come, we have rushed these same young men, often inadequately trained, to the foxholes and into the air and onto the sea, where a carefully prepared enemy has started shooting at them. . . . We must stop this falsification."

ARMY AIR FORCE

The activities of this unit of our armed force in 1947 were so many and so varied that there is space only for brief mention of the notable events.

In January, a Boeing B-17 "drone" Flying Fortress, remotely controlled by a "mother" B-17 flew a demonstration bombing mission. The drone took off from Eglin Field, Florida, flew to Richmond, Virginia, wheeled out to sea where a dummy bomb was released by remote control, then went on to Washington, circled the city and returned to Eglin Field. A similar demonstration had been flown in 1946 from Hilo, Hawaii to Muroc, California.

Approximately 1,500 Boeing B-29 Superfortresses were saved for future use by a new "cocooning" process whereby a succession of coats of protective spray are applied until the plane is enveloped in an airtight case, seven times stronger than rawhide and designed to keep out harmful moisture for approximately 10 years.

In January, the Consolidated-Vultee Aircraft Corporation moved the Army Air Forces' XC-99 outdoors to install its main landing gear and outer wing panels. Ten months later, on Nov. 24, the XC-99, the world's largest land plane, passed its first aerial test, cruising for an hour over San Diego at a speed of 220 MPH. This giant is double-decked, spans 230 feet across the wing and is 182½ feet long. It will carry 400 troops, 335 litter patients, or 100,000 pounds of cargo. The XC-99 is powered by six Pratt-Whitney, 3,000-horsepower, pusher-type engines, turning 19-foot reversible pitch propellers.

Army Air Forces and Army Ground Forces added the Boeing L-15A, newest member of the "Flying Jeep" family, to its liaison force. It is intended for direction of artillery fire, reconnaissance, aerial photography, and emergency supply operations. It can take off with flaps fully extended and clear a 50-foot obstacle in 600 feet, and, similarly, land over a 50-foot obstacle, coming to a stop in 517 feet. A Boeing XL-15 liaison plane was tested in July. It is unconventional in appearance with gondola-type fuselage and inverted tail surfaces.

The Air Forces' new jet bomber, the Northrop VB-49, was successfully tested. This plane is a jet-propelled version of the Northrop B-35 "Flying Wing," spans 172 feet across the wing but is only 53 feet long, due to the absence of a conventional fuselage. It is powered by eight General Electric J-35 jet engines and has a service ceiling in excess of 30,000 feet. Crew capacity of the "wing" is 13 men.

Lieutenant Colonel Robert E. Thacker and Lieutenant John M. Ard flew non-stop in a North American P-82 Twin Mustang from Hawaii to New York. The plane left Hickam Field, Hawaii, at 8:34 p. m., Thursday, Feb. 27 and landed at La Guardia Field, New York, at 11:07 a. m. the next day, completing the longest fighter mission on record, 5,051 miles.

The Hughes Aircraft Company built a new high speed photo reconnaissance plane, the XF-11. It is a twin-boomed, two-place monoplane, spanning 101 feet 5 inches across the wing and is 65 feet 5 inches long. It is capable of 400 miles an hour speed and has a ceiling of over 40,000 feet. Six cameras are mounted in the nose and booms, with operating controls duplicated in the nose and pilot's cockpit. Special equipment is provided to heat the cameras and to defrost camera windows in high altitude operations.

The VC-97 "Stratofreighter" successfully completed its first test flight at Boeing Field, Seattle, on March 11. Spanning 141 feet 2 inches across the wing and 110 feet 3 inches long, the VC-97 can carry its cargo load a distance of 4,000 miles, at a speed in excess of 300 miles an hour. Its ceiling is 30,000 feet; and it is manned by a crew of five men.

The Consolidated-Vultee XB-36, a six-engine bomber, on March 12, lifted the heaviest load ever lifted from the earth by a plane. Testing at Fort Worth, Texas, it took off at a gross weight of 278,000 pounds.

The Lockheed P-80A "Shooting Star" jet fighter passed the rigid requirements for the installation and performance of armament when a test aircraft successfully fired over 64,000 rounds of standard 50-caliber ammunition without damage to the plane.

The XB-45, one of America's first operational bombers to employ jet propulsion, remained aloft for an hour and 4 minutes in successful test flight at Muroc Air Base, California on March 17. Another jet-propelled bomber, the XB-46, successfully passed its test later, on April 3, at San Diego, California. This is a high-speed, high-altitude bomber. On June 22, the XB-48, built by the Glenn L. Martin Co., Baltimore, Maryland, passed its first test. This jet bomber has a speed of over 480 miles per hour and a tactical radius of over 800 miles.

In October, Boeing's Seattle plant began testing the newest jet-propelled bomber, the XB-47. Radically new in design it uses sharply swept-back wings and tail surfaces. It is powered by six engines, four mounted in pairs slung under the inboard sections of the wing. One additional jet engine is mounted on each wing near the tip.

Cruising 27 per cent faster than the B-29 Superfortresses, and about 50 miles faster than any other Army bomber capable of equal range, the Boeing B-50 qualified in its first tests from Boeing Field at Seattle.

A pilotless Douglas C-54 "Skymaster" made a completely automatic flight from Stephensville, Newfoundland to Brise Norton in England in September, making the trip in 10 hours and 15 minutes.

The first post-war delivery of a Sikorsky R-57 helicopter was made to the Army Air Forces in May. In July, the Air Forces' largest helicopter, the Kellett XR-10 was successfully tested in Pennsylvania. During August, the Bell Aircraft Corporation tested a new five-place helicopter, the XR-12, with a top speed of 105 miles an hour and an operating speed of 90 miles an hour. It can climb vertically at the rate of 450 feet a minute; ceiling 13,000 feet. In September, an R-5 helicopter was flown to Bettles, Alaska, to rescue a trapper stranded on a sand bar.

On Feb. 10, 1947, Norden Bombsight No. 4120, used when the first atomic bomb was dropped on Hiroshima, was presented to the Smithsonian Institution in Washington. On this same date, the Air Forces celebrated the 39th anniversary of the signing of the first contract to purchase an airplane. The 1908 contract called for the purchase of "one heavier-than-air flying machine" for $25,000. On Feb. 16, the All-Weather Airline, familiarly known as the "Green Ticket Run," completed its first six months of operation round trip between Wilmington, Ohio, and Andrews Field, Maryland. On March 16, a 75-mm. howitzer weighing 2,240 pounds was successfully lowered from a Fairchild C-82 Packet by using a series of two ribbon parachutes. During March, the Air Weather Service of the Air Forces started a series of routine weather reconnaissance flights over the North Pole, planning on half-hourly weather observations. In June, the Air Forces announced development of the most powerful turbo-jet engine ever produced. A P-80R "Shooting Star" recaptured the world's speed record on June 19 at Muroc Air Base, flying at a speed of 623.8 miles an hour.

In July, the Air Forces had in operation its new climatic hangar at Eglin Field, Florida. In it can be simulated every extreme of weather conditions, including wind, sleet, snow, rain, and sand storms. On July 23, at Missoula, Montana, planes, for the first time, dropped water bombs on a forest fire. The "Pacusan Dreamboat" broke the international closed course speed record for 10,000 kilometers on July 31, and, four days later, broke another international record when it flew a distance of 8,854.8 miles over a triangular course in 39 hours. In October, the Air Forces again assisted in fighting forest fires, when their planes carried fire-fighters and equipment to the disastrous fire area near Bar Harbor, Maine.

BIRTHDAY ANNIVERSARIES

In addition to the regular service unit anniversaries, two unusual birthdays were celebrated— On March 1, 1947 the Boeing B-17 "Flying Fortress" celebrated its 10th anniversary as a member of the Army Air Forces aerial fleet. On March 11 the 100th anniversary of the occupation of the Presidio of San Francisco by U. S. troops was observed. Two companies of soldiers under command of Major James A. Hardie took possession of the post on March 11, 1947. These troops were part of Colonel Stevenson's New York Volunteers who had reached the newly annexed territory of Alta, California after a sea voyage around Cape Horn.

CEMETERIES

The American Battle Monuments Commission began its work in connection with providing permanent improvements in our cemeteries overseas for the dead of the Second World War, and of erecting suitable memorials to the achievements of our Armed Forces. More than ten thousand of the nation's war dead were returned to their native soil for burial. It is expected that eventually 200,000 bodies will be brought back to the United States. Bodies so returned will be buried in military or private cemeteries at the option of the next-of-kin. The first $75 of private burials will be defrayed by the Government, while national cemetery interment will be entirely at government expense. The first bodies to be returned were landed at San Francisco, Oct. 10.

COSTS OF WAR

The Second World War was almost twice as expensive in lives and 20 times as expensive in wealth as the First World War, according to figures released in April 1947. Comparative statistics show:

Wars	Dates	Total U. S. Troops	Total Dead	Total Cost
Mexican	1846–48	104,284	12,946	$ 139,500,208
Spanish-American	1898–99	408,391	6,472	992,159,840
World War I	1917–21	3,665,000	193,663	21,850,000,000
World War II	1941–	10,200,000	313,000	340,000,000,000

It is estimated that by 1972, accruing costs directly connected with the Second World War will raise the money cost to $700,000,000,000.

EDUCATION

Retention of the U. S. Armed Forces Institute was urged as a needed factor in providing educational opportunity. There are at present about 240,000 individual enrollments under the USAFI program and, since its inception in 1942, cumulative enrollments exceeded 1,700,000.

ARMY ENGINEERS

General Wheeler, Chief of Engineers, announced that in the past 10 years, Army engineers, notwithstanding interruption through war work, had placed in operation 50 reservoirs and 135 local protection projects as part of the continuing program of flood control. The 1948 fiscal year budget called for an appropriation of $163,000,000; an additional $24,000,000 was asked for the Lower Mississippi River Valley.

In March, Army Engineers offered for lease to private industry portions of 31 government-owned industrial plants which had been initially designed for the production of munitions and chemicals.

Some of the construction jobs of the Engineers included: A new runway and new hangar at Mile 26 Field, Alaska; a giant hangar for the heavy bomber base at Rapid City, South Dakota; installation of water and sewer facilities for the Research and Development Laboratories near Yuma, Arizona; initial work in building the greatest medical research center in the world, to be located at Forest Glen, Maryland; barracks and mess facilities for 500 men at Vint Hill Farms Station, Warrenton, Virginia; the erection of 41 buildings, containing 164 military housing units at Andrews Field, Maryland; and the furtherance of the Veterans Administration hospital construction program, estimated to cost $770,000,000.

FOOD

In one year the Veterinary Corps of the Army inspected 1,368,412,978 pounds of food of animal origin. Of this amount, 40,000,000 pounds may be rejected for non-compliance with type, class, or grade, and another 6,000,000 pounds is known to have been rejected, at time of procurement, as insanitary or unsound.

The Army is now spending 32 per cent more a day to feed a soldier than it did in 1946. The value of a garrison ration jumped from 60.07 cents to 79.88; the field ration advanced from 60.07 to 72.88.

In January, 1947 the Medical Department called for 50 additional dietitians, in the grade of 2d Lieutenant, for assignment to Army hospitals.

GUIDED MISSILES

Dispelling a belief of German scientists that parachutes could not be used above 150,000 feet, Army Air Forces engineers devised a system to recover delicate instruments and cameras released from a captured German V-2 guided missile's warhead at an altitude of 500,000 feet, using a series of two newly developed ribbon parachutes.

In the past two years, development of new aircraft and guided missiles by the Army Air Forces, has reduced the V-1 and V-2, Hitler's "secret terror weapons," to the status of obsolete weapons so far as tactical use is concerned. High-speed jet fighters and the new supersonic guided missiles, such as the Gapa rocket, render the buzz bombs obsolete owing to their slow speed and range.

MANEUVERS

The Finn Ronne Antarctic Expedition left Beaumont, Texas, in January, 1947 on the first leg of a trip to the south polar regions. The expedition was loaned $250,000 worth of specialized equipment by the Army Air Forces. In return, the Air Forces will receive a complete report of the cold weather testing of the equipment, as well as the most up-to-date charts, maps, and scientific data compiled by the expeditions scientists.

Newest developments in equipment and techniques used in airborne operations were demonstrated to Air Forces troop carrier and Ground Forces airborne personnel in the Far East. A Fairchild C-82 Packet, modified for the job, was used, three airborne officers and six enlisted men participating. Leaving from Fairfield-Suisun, California, Army Air Field, the plane spent two months in demonstrations over Japan and at other installations in the Far East.

After a period of preliminary instruction in the United States to provide training on snow-covered terrain, five augmented companies of the 2d Infantry Division and Troop Carrier aircraft of the Tactical Air Command were flown into Alaska, beginning Nov. 1, 1947, for Arctic exercises to be terminated in March, 1948. This maneuver was termed "Exercise Yukon."

Appropriately designated "Task Force Furnace," a special unit of Army Ground Forces was assembled and despatched from Fort Knox, Kentucky, to Yuma, Arizona, where summer temperatures exceed 125 degrees during daylight hours. In all, 300 officers and enlisted men participated in the operation. Task Force Furnace did not engage in maneuvers or tactical problems since its sole function was to service testing of equipment required by the Army Ground Forces in desert warfare.

Two thousand paratroopers of the 82d Airborne Division were selected by General Jacob L. Devers, Army Ground Forces, to conduct tests at Pine Camp, New York, from November, 1947, through March, 1948. This specially chosen combat team will receive thorough indoctrination in cold weather operations. It will both test equipment and carry on a full-scale maneuver within the boundaries of the reservation. Tactics and techniques pertinent to air transportation of men and equipment under cold weather conditions will be perfected, particularly for over-snow operations. The group will study airborne resupply and evacuation, involving the dropping of equipment by parachute. Observations will also be made as to the efficiency of gliders and liaison planes on ice and snow. The entire maneuver was christened "Operation Snowdrop," under command of Lieutenant Colonel Robert H. Wienecke, a distinguished veteran of the Second World War.

Latest Army Air Forces techniques and developments in tactical cooperation with ground units were displayed for 1,000 service school students during the entire month of October in a maneuver designated "Operations Combine," held at Lawson Field, Fort Benning, Georgia. Aerial demonstrations were presented by the 9th Air Force, with headquarters at Greenville, South Carolina.

Personnel of "Project Cirrus," the joint cloud physics investigation by personnel of the Army Signal Corps, the Office of Naval Research, and the General Electric Company, conducted their first experiments into the effects of "seeding" storm clouds with dry ice.

"Exercise Seminole," designed to test landing of heavy armored equipment on beaches, was somewhat bogged down at Tyndall Field, Florida, when the too perfect weather of the first week in November was encountered. Floating causeways, lowered on Nov. 3 from LSTS were anchored so far inshore that they were thoroughly grounded when the tide went out. The exceptionally calm weather cut down the waves to the point where the causeways could not be floated and carried out to sea, there to be used as originally planned in unloading the heavy armored vehicles from the LSTS. However, the 2d Armored Division tanks, half tracks, self-propelled guns, and fortified personnel carriers finally plowed through the surf to the shore, towing whatever jeeps had been inundated. All vehicles had their ignition systems waterproofed, and all motor exhausts and carburetor intakes were piped into the air. Secretary of the Army Royall was satisfied with the results of the maneuver and stated that the slight delays encountered only served to emphasize the need for more joint amphibious maneuvers.

The Associated Press, Dec. 2, 1947, printed a release concerning projected atomic tests behind a curtain of absolute secrecy in the remote Pacific. The 145 inhabitants of the Atoll Islands of Aomon and Biijiri will be transported to new and permanent homes. Unlike the surface and underwater atom bomb tests at Bikini Atoll in the summer of 1946, covered by several hundred reporters and foreign observers, the new maneuvers will be under full security restrictions. Eniwetok, with only about 2¼ square miles of land, was chosen for the present tests because of its isolation. There are hundreds of miles of open seas in the direction in which winds might carry radio active particles. Eniwetok lies halfway between Hawaii and the Philippines, and the closest big land area is New Guinea, 1,500 miles to the southwest. Lieutenant General John E. Hull, Pacific commander of the Army, has overall command of the project.

MEDICAL

In the program of 74 hospitals being erected by the Army Engineers for the Veterans Administration, the Chicago project for cancer treatment attracted much attention. This is the only hospital and research center designed solely for cancer treatment in the Army program and, early in January, 1947 specialists in cancer treatment and research met with architect-engineers in Chicago for the planning of this 600-bed institution. Meantime, the Army Medical Department continues to operate its four Deep X-ray centers for deep radiation therapy treatment of cancer. These are located at Walter Reed General Hospital, Washington, D. C.; Beaumont General Hospital, El Paso, Texas; Army and Navy Hospital, Hot Springs, Arkansas; and Letterman General Hospital, San Francisco, California. The highest incidence rate of cancer reported between the years 1941 to 1945 was 0.34 per 1,000 per year or about three men out of every 10,000.

An Aural Rehabilitation Center was dedicated during the year as part of Walter Reed General Hospital's improved facilities for the hard-of-hearing. Work in this special field of rehabilitation and treatment had been begun at Walter Reed in 1943. Later, other Aural Rehabilitation Centers were established at Butler, Pennsylvania, at Borden General Hospital, Chickasha, Oklahoma, and at Hoff General Hospital, Santa Barbara, California. Treatment for impaired hearing has been given to 8,400 patients at these centers.

A new artificial hand was announced during the year. Both cosmetically and mechanically it is far superior to anything perfected to date. The "hook" hand has long been recognized as the best that could be provided from a utility standpoint. In the new mechanism just perfected, the hand operates more effectively for the amputee and, in addition, has the appearance of a natural hand.

Surgeon General Norman T. Kirk strongly advocated establishment of a Medical Service Corps within the Medical Department of the Army. He believes that the skills of highly trained individual specialists could be more effectively and economically utilized by grouping them into one Corps. Centralized procurement and assignment and better supervision and training would also be possible. General Kirk's proposed Corps would be composed of sanitary engineers, pharmacists, optometrists, psychologists, bacteriologists, and similar skilled personnel. When President Truman approved the legislation implementing General Kirk's recommendations, the Medical Service Corps became an operative entity on Aug. 5, 1947. For the first time in its history, the Regular Army can now give commissions to specialists in the scores of fields closely allied to medicine.

Within the Army Air Forces in the Alaskan area, parachutists rescue teams of medical technicians and guides were organized. These teams each included two medical technicians, two Alaskan guides, and a jump surgeon. This is a part of the program to enlarge polar rescue squadron facilities to bring in cases involving aircraft forced down in areas normally inaccessible to ordinary rescue operations.

In July, the Department of the Army announced that the Army's venereal disease rate, at home and abroad, had reached a post-war low. The latest figures available, for May 1947, show a 30 per cent decrease from the post-war high in the summer of 1946.

MUNITIONS

Active research and development in this field covered practically all of the Army's activities. Airplanes were newly developed, old types were remodeled or redesigned for greater speed or maneuverability; rockets and ribbon parachutes were tested at White Sands, New Mexico, chemical agents were studied at Edgewood Arsenal in Maryland; Signal Corps equipment received working tests in New Jersey and elsewhere. Some of the recent munition developments are here briefly discussed.

Considerable work was done in an attempt to perfect American-designed turbo-jet and gas propeller combinations. Engine designs were worked out for pulse-jet and ram-jet engines and rocket devices with thrust values from 3,000 up and with power equivalents of from 3,000 horsepower up. For a transonic research airplane, a multiple-cylinder rocket engine, weighing 210 pounds, was built. For fuel, liquid oxygen and alcohol were used. The most powerful turbo-jet engine yet made, was built at Burbank, California. It is named the XJ-37 and developed a rated thrust of 5,000 pounds.

A new way was found to manufacture nitromethane, a more powerful explosive than TNT, by reacting methane with nitric acid.

The Army Air Forces, the National Bureau of Standards, and the Bendix Aviation Corporation joined forces to develop a simple and practical liquid oxygen converter which meets all requirements in flying operations.

A new type of synthetic non-petroleum motor oil was made from natural gas and carbon and hydrogen compounds. It resembles ordinary motor oil in appearance and feel; is wax-free; flows freely at 30 degrees below zero and does not thin out at high temperatures; and lasts the lifetime of an automobile or airplane engine without having to be changed.

In Alaska and the Aleutians, a new heat tablet, Troxane, was tested. Burning without odor or poisonous gases, it produces a steady blue flame not easily blown out by the wind. The Quartermaster Corps also issued a new water-purifying tablet which uses iodine instead of chlorine as its active agent. This new tablet makes drinking water less objectionable in taste and color.

At the Evans Signal Laboratory in New Jersey, a new light weight radar set, the AN/TPS-3, was designed. Weighing 1.340 pounds, it can be transported by plane and set up forward in areas not easy to reach with heavier detector equipment. This new set requires one operator and one maintenance man and withstands temperatures between 40 degrees below zero and 140 degrees above. Within the Signal Corps field there was also developed a new micro-wave spectroscope for the analysis of chemical substances, using radio waves to identify the more complicated molecules, such as hydrocarbons, without the tedious work necessary to effect chemical breakdown and analysis.

TELERAN

The Army Air Forces, working with the Radio Corporation of America, made definite advances in the perfection of teleran, the revolutionary system of television-radar air navigation and traffic control. Teleran provides the air pilot with an aerial roadmap, which, in a single picture on his instrument panel, shows traffic route, weather, and special information needed for safe and successful air navigation. To improve teleran, four new advances were demonstrated, (1) a storage orthicon pick-up tube, (2) a picture tube employing high-intensity phosphors for greater image brilliance, (3) an optical map-mixing technique which improves the composite teleran image and simplifies insertion of additional information when required, (4) a time multiplexing system which provides for simultaneous transmission of images representing different altitude layers and selective reception of the proper image by planes in any of these layers.

OPTIPHONE

The Signal Corps also introduced the optiphone which makes possible telephone communication over a narrow beam of white or dark-red light. The complete unit weighs 145 pounds, has an optical range up to four miles during daylight and, with dark-red filter, up to seven miles at night. It provides single-channel, two-way break-in speech communications.

NEW SUPERSONIC WIND TUNNEL

At Pasadena, California, the Air Corps has under construction a new supersonic wind tunnel, the first of its kind in the United States. It will cost

$2,384,000 to build and is designed to test the characteristics of ram-jet motors and other rocket type motors.

NATIONAL DEFENSE PLANNING

During 1947, formation of Industry Advisory Committees to aid in National Defense planning was begun. Membership in these committees will be comprised of representatives of United States industry. When formed, these committees will aid the Army-Navy Munitions Board in planning for future emergencies, in the creation of an industrial mobilization plan, and in the Army-Navy stockpiling program. This latter function, authorized under Public Law 520, provides the procurement and maintenance of adequate stockpiles of strategic and critical materials.

NATIONAL GUARD

As of Aug. 1, 1947, the strength of the National Guard was 107,711. Announcement was made that "Operation 88,888" would be conducted during the period Sept. 16 to Nov. 16 to enlist an additional 88,888 men. By Oct. 25, Major General Kenneth F. Cramer, Chief of the National Guard Bureau, announced that organization of the National Guard had passed the half-way mark with 3,251 ground and air units Federally recognized out of a total allotment of approximately 6,380. In the final week of "Operation 88,888," the National Guard enlisted 17,539 men, raising its strength to 195,026 as of Nov. 16, 1947. This put the Guard two months ahead of its planned rate of growth during the current fiscal year. Congressional appropriations provide for growth of the National Guard to a strength of 271,000 men by June 30, 1948.

ARMY NURSES

On July 18, 1947, Colonel Florence A. Blanchfield, Superintendent of Army Nurses, became the first American woman to receive a full commission in the Regular Army of the United States. Thus the Army nurses came to full recognition in the service, a growth which traces its development back to 1861 when Dorothea Dix was made first superintendent of nurses in the Army. This present development comes under the provisions of Public Law 36 of the 80th Congress which grants permanent commissioned status to members of the Army and Navy Nurse Corps and establishes a Women's Medical Specialist Corps in the Regular Army.

OCCUPATION FORCES IN GERMANY AND AUSTRIA

During the first week in January, 1947, economic merger of the American and British Zones of Germany became effective. Operating responsibility for the production and distribution of food and industrial goods for the combined area was turned over to German Administrative Agencies under American and British supervision and control. In November the Departments of State and Army and the Office of Military Government for Germany announced promulgation of Military Government Law No. 59 providing for the restitution of identifiable property which was taken from its owners by the Nazis during the period from Jan. 30, 1933 to May 8, 1945.

In Austria, agreement was reached in Allied Council on a plan to alleviate the food situation, operate the denazification law, and determine occupation costs for the first quarter of 1947. Fuel and power shortages, intensified by severe weather conditions, were responsible for industrial and transportation slowdown. Soviet Russia's refusal to discuss Austrian affairs financially within the Allied Council added to the occupational government problem. When the Foreign Ministers Conference failed in April to produce an Austrian treaty, the people of Austria began to be alarmed regarding the economic results of continued occupation. When the Austrian Government sought in May to proceed with plans for future development of civil aviation in their country, their efforts were blocked by the Soviets. Three important financial arrangements were concluded in mid-year between the United States and Austria. These were: (1) The signing on June 21 of an agreement whereby the United States assumes all of its occupation costs after July 1; (2) the signing on June 25 of an agreement on the use of Austria's portion of the $350,000,000 relief program provided by the American Congress for devastated countries of Europe, and; (3) an agreement signed on June 29 whereby the United States turns over to the Austrian Government 308,382,590 schillings as final settlement of all occupation costs prior to July 1, 1947.

JAPAN AND THE FAR EAST

General MacArthur reported definite progress in Japan toward a democracy. Japan's new laws created a popularly elected upper house, replacing the former hand-picked elite of the old House of Peers. Buckling down to their task, party leaders in Japan focused attention on possible measures to stem the rising tide of inflation. It appeared that MacArthur's New Year's Day message (1947) was being taken seriously everywhere. He had told the people that the successful implementations of projected reforms charted under the occupation hinged on "the manner in which the Japanese people themselves discharged their new political responsibilities." In September, MacArthur reported that the newly elected Diet produced the first cabinet to serve under the new Constitution and entrusted the country's leadership to the first Christian prime minister, Tetsu Katayama, Social Democrat, ever chosen in the history of Japan.

In Korea, the first general election held since 1910 indicated that the Koreans were anxious to take a real and progressive part in the government of their country. In the early part of 1947, commercial activity in southern Korea was generally on the upswing although complete industrial recovery was seriously retarded by the shortage of raw materials, lack of skilled labor, and currency inflation. Hope for the democratic emergence of Korea lies in the Interim Legislative Assembly, with 45 elective and 45 appointive members, in session starting in December 1946. As Koreans showed ability in handling their own affairs, United States authorities in South Korea absorbed many more Koreans into influential government posts. In March, Koreans took further steps to prepare for ultimate self-government as the Interim Legislative Assembly considered drafts of a temporaray constitution based on democratic principles and of a General Franchise Law which would give all men and women over 20 years of age the right to vote. In May, the Korean Assembly passed three measures which constituted definite steps in advancement. These were the Summer Grain Collection Law, the National University Bill, and the Child Labor Law.

Reclamation of war devastated areas, rebuilding of local industries, and resettlement of lands formerly occupied by the military were the major rehabilitation concerns of 833,000 people of the Ryukyu Islands. In March 4,222 persons were resettled on Ie Shima which had been uninhabited for two years.

ARMY OFFICERS

In January, 1947, a small increment of the total of 25,000 officers authorized by Act of Congress for the Second Regular Army Integration Program was sworn in. At that time it was announced that the Army Air Forces would bring in 10,000 officers under this program in 1947. In May, 9,209 successful officer candidates were integrated; of these, 6,264 were sworn in as Air Forces officers. This increment brought to nearly 22,000 the number of persons selected as Regular Army officers since the program began in the summer of 1946.

In November, the Department of the Army and the Department of the Air Force announced that eligibility requirements for competitive tours of active duty leading to commissions had been broadened. The new policy permits officers, who are high school graduates but who do not have two years of college, to take an Educational Development test to establish eligibility in lieu of the college education previously required.

QUARTERMASTER CORPS

Preliminary tests of Army tableware made of molded plastics indicate that these items have many advantages over china dishes for military uses. Plastic soup bowls and cups were used by the Admiral Byrd Antarctic expedition with great savings resulting through reduction in breakage. For field duty, plans were made to use a plastic spoon which may be thrown away after it is used for one meal.

Fresh vegetables for use with Army rations in overseas installations where they can not otherwise be supplied, are being produced successfully by hydroponic gardening. This garden method, also known as nutriculture, water culture, and chemi-culture, consists of beds of gravel, stones, cinders, or other inert materials in which vegetables are grown by supplying them with water and the nutrient chemicals necessary for their growth. Hydroponic gardens were operated on Iwo Jima, in British Guiana, China, and Japan. Two gardens in Japan—one of 55 acres at Chofu in the Tokyo area and another of 25 acres at Otsu in the Kyoto area, produced a total of 2,000,000 pounds of tomatoes, 310,000 pounds of lettuce, 200,000 pounds of radishes, 440,000 pounds of cucumbers, 170,000 pounds of onions, and 60,000 pounds of peppers, or a total of 3,180,000 pounds of vegetables. This would be enough to supply eight salad meals per week for 100,000 military personnel and their dependents.

A solution of the beverage milk problem for troops was found by dairy experts of the Quartermaster Corps. Mechanical recombination of the solid ingredients of milk with butter, oil, and water was found to produce satisfactory drinking milk, and plants for this new production system are planned for Japan, Korea, the Philippines, Guam, and Okinawa.

The Quartermaster Corps did considerable work in trying to develop a "glad sack," or new type inflatable sleeping pad so that troops could sleep on the snow or cold ground with adequate protection from chilling due to loss of heat.

RADAR

Long-range radar units, designed for exact plotting of aircraft, and worth about $1,000,000, were installed at Washington, D. C. National Airport and at Andrews Field, Maryland. In February, long range radar equipment was installed on the grounds at Queens College, near La Guardia Field, New York, to test the value of such radar devices in the control of heavy air traffic over cities similar to New York.

The first all-radar airway was installed in Alaska, using navigational beacons known as "racon" at seven installations.

During the year, direction-finding equipment was installed and put into operation at 18 locations. These were of the same type used successfully in the Second World War, and were installed primarily to assist military aircraft.

Under an agreement reached between the Army Air Forces and the Pan-American World Airways, the Pan American received an AN/cps-5 search radar unit with a range of about 150 miles.

The Army Air Forces announced perfection of an automatic radar landing system which, used with a standard Ground Controlled Approach unit, will electronically and without human aid bring an aircraft to within a few feet above a runway. The new system will enable a speed-up of the present landing system, which permits only one aircraft at a time on the glide path. Installed, the new device weighs about 75 pounds and costs approximately $10,000.

RECRUITING

The Department of the Army, to encourage enlistments, announced that, starting in 1948, Army enlisted personnel will have opportunity for specialized education, advancement in grade, and commissioning in the Officer's Reserve Corps and in the Regular Army. Each job in the Army is carefully analyzed and, through a new system of personnel procedures, the effort will be to get the right man into the right job at the right time.

ARMY SCHOOLS

Early in the year, the Chaplain's School, Adjutant General's School, and the Provost Marshal's School were moved to Carlisle Barracks, Pennsylvania. These historic Barracks housed the first military school in United States history, the School for Artillerists established in 1777. Later in the year, the Adjutant General's School was transferred from Carlisle to Camp Lee, Virginia.

The Command and General Staff College at Fort Levenworth, Kansas, was transferred in January from the jurisdiction of the Department of the Army to that of the Commanding General, Army Ground Forces. This institution had been founded originally, in 1881, as the "School of Application for Infantry and Cavalry."

In line with the Army's specialized training program, a new Special Services School was established at Fort Monmouth, New Jersey, Feb. 15, 1947.

Increasing emphasis was placed during the year upon joint schooling of officers from the three services. Plans called for at least 900 selected officers of the services to be studying together in advanced service schools. At the National War College in Washington, D. C., 30 officers each from the Army Ground Forces, Navy, and Army Air Forces, and ten from the State Department were registered for the second course starting in September.

ARMY TRAINING

Reopening of Aviation Cadet pilot training was announced in January, 1947, first quotas to be filled by qualified Regular Army enlisted men of the Army Air Forces. Under this program, during the Second World War, more than 1,250,000 volunteered for air crew training and 700,000 qualified. It is expected that 3,000 cadets will be in training in 1948.

In the first cruise of its kind for Army ROTC students, 49 students of the ROTC detachment at the University of Washington left Seattle, Washington, on March 21 aboard a Transportation Corps freight supply ship bound for Ketchikan and Juneau, Alaska. On their 10-day cruise, the cadets were afforded practical training in military transportation methods aboard small vessels. In July, 149 ROTC cadets, representing 13 universities, went to sea for similar training.

The former eight weeks basic recruit training program was on May 5, 1947 lengthened to 13 weeks. This increase was made possible by the easing of demands for personnel overseas.

The Director of Personnel and Administration in the General Staff perfected and put into operation an extensive program of training in industrial personnel methods designed to familiarize Army officers with the latest techniques in personnel management. By May, four industrial firms had already accepted officer students and 35 more large industries had signified their willingness to join in the program.

To lend realism to field training, the Ground Forces designed and put into effect an interesting expedient. Instead of dividing participating forces into "reds" and "blues" with colored arm bands as the only distinguishing feature between friend and foe, distinctively dressed "enemy" forces met combat units being trained in the field. The enemy was designated "Aggressor" and was clad in forest green uniforms with helmets of the same color. Noncom chevrons were worn on the sleeve between the elbow and the wrists with points down. Officers' ranks were indicated by devices foreign to normal Army usage. Prisoners were taken and "enemy dead" dummies were found on the "battlefields" by the maneuvering troops. Aggressor artillery's flash, smoke, and noise was represented by electrically exploded cellulose nitrate balls in special firing tubes, while other battle sounds were created by mobile sound-amplifying units. Heavy equipment consisted of life-like pneumatic mock-ups.

MILITARY LESSONS OF THE SECOND WORLD WAR

Lieutenant General Collins, Deputy Chief of Staff, speaking before civilian groups, gave frank analyses of the direct and contingent effects of the Second World War. He particularly stressed these lessons in relation to future security of the United States. Some of his material is repeated here.

General Collins recognized that the outstanding military lesson gained from the Second World War is that airpower is the dominant factor of present day warfare. The next most important lesson is the tremendous importance of scientific developments. Unity of command, as demonstrated by the operation of General Eisenhower's headquarters in the European Theater, pointed the way to command cohesion in future armed conflict. Back of these military elements was the convincing demonstration that America's ultimate strength lies not in superior numbers of men nor in superior quantities of raw materials but in her matchless skilled labor, industrial know-how, and productive plant. These are the basic sinews of war as well as the heart of our peacetime position.

In reviewing the world situation today, General Collins said: "Germany is no longer a threat as a military power . . . from the viewpoint of manpower alone, the British Empire will probably never be as strong again as it was in the past. . . . France from a military viewpoint is relatively impotent . . . from the manpower standpoint China is potentially a great military power but is too torn with internal strife to capitalize on her favorable . . . position. . . . This leaves us with the fact that the United States and Russia are the two predominant military powers in the world today."

Since the Second World War, the United States Army has demobilized 90 per cent while the Russians have reduced their ground forces ⅔ and their air forces about ⅓. What then of necessities in case we face major war again?

The first thing we must learn is to reckon the capabilities of other powers rather than probabilities. Having arrived at an estimate, what do we need and, of this need, what do we have? There was no such American cold-blooded estimate of the military capability of Japan—hence Pearl Harbor.

For modern war, which is perforce total war, the United States should have in being an M-Day force ready for immediate action. This force is planned as 1,750,000, comprising: Regular Army, 10 Divisions and 70 Air Groups; National Guard, 27 Divisions and 27 Air Groups; and some 200,000 Reserves in service units. To back up this sizable M-Day force, a pool of trained men is required. Procurement of this pool depends entirely on the successful operation of Universal Military Training.

IX. DEFENSE AND ARMAMENT

ADMINISTRATION OF VETERANS AFFAIRS

By Carl R. Gray, Jr.
Administrator of Veterans Administration

ORGANIZATION AND FUNCTIONS OF THE VETERANS ADMINISTRATION

The Veterans Administration is an independent establishment of the United States Government charged with administering benefits provided by law for nearly one-third of the nation's population—veterans of all wars and their families. The agency, headed by an Administrator of Veterans Affairs, was created by Executive Order No. 5398, July 21, 1930, issued under authority of an Act (46 Stat. L, 1016) approved July 3, 1930. Its original purpose was to unify the work of numerous Federal bureaus which, at that time, were administering benefits to veterans and their beneficiaries.

VA entered the American scene at the beginning of a severe depression, at a time when veterans problems of earning a living became increasingly acute. The uncertainties of the period were reflected in the fact that First World War veterans began to swell VA's rolls to record high levels; also, applications for hospitalization and domiciliary care increased steadily, with a number of cases resulting from mental and physical ailments caused by the hardships of the depression.

The 4,000,000 First World War veterans constituted a serious employment problem during the 1930's, because many employers were reluctant to hire men of their age. VA cooperated with the U. S. Employment Service of the Department of Labor and with other Federal agencies in efforts to find work for them.

GROWTH AND SCOPE OF VETERANS ADMINISTRATION

Severe as VA's problems were in those days, they faded into relative insignificance by the time Japan surrendered in the summer of 1945. From then on, the number of servicemen and women discharged from the armed forces increased with ever gathering momentum. Between October, 1945 and February, 1946, they returned to civilian life at the rate of more than 1,000,00 each month.

By Nov. 1, 1946, the number of living veterans of all wars totaled 17,441,000; 13,490,000 had served in the Second World War. A year later, on Nov. 1, 1947, the total number of living veterans increased to 18,514,000 of whom 14,625,000 saw active duty in the Second World War.

Meanwhile, VA's relationship with these millions of veterans had been augmented by a number of new laws designed expressedly to help homecoming servicemen and women make smooth adjustments to civilian life.

Most important of these laws was the Servicemen's Readjustment Act of June 22, 1944 (Public Law 346, 78th Congress), as amended. Generally known as the G.I. Bill, the Act applies (with some exceptions) to any Second World War veteran discharged under conditions other than dishonorable after 90 days or more of service, or discharged by reason of an injury or disability incurred in line of duty. Broadly, it provides for educational and vocational training aids; guaranty by VA of loans for homes, farms, or business purposes; payment of readjustment allowances to unemployed or self-employed veterans; and other benefits geared to help veterans help themselves readjust to civilian life.

To bring its services closer to the veteran and his family, VA decentralized a number of its functions in 1945. In addition to a Central Office in Washington, D. C., VA has 13 branch offices throughout the United States to supervise the field operations of nearly 1,000 VA offices, hospitals, and homes in the continental

United States and in Alaska, Hawaiian Islands, Puerto Rico, and the Philippines.

On Nov. 1, 1947, the total of nearly 1,000 included 736 field offices (formerly known as contact and subregional offices), 70 regional offices (9 of which were located at VA centers), 126 hospitals (21 of which were located at VA centers) and 12 homes. VA's Central Office exercises general control over all these operations.

The vast scope of VA's far-flung operations is indicated by the fact that the agency maintains 103,000,000 veterans records and other records of various types, and that it received an estimated 175,000,000 pieces of mail during the fiscal year ended June 30, 1947.

EDUCATION AND TRAINING

Education and training for Second World War veterans is authorized by two laws: Public Law 16, 78th Congress (as amended by Public Laws 346, 78th Congress; 268, 79th Congress; and 239 and 338, 80th Congress) and Public Law 346, 78th Congress (as amended by Public Laws 679, 79th Congress; and 239 and 377, 80th Congress).

Public Law 16—the Vocational Rehabilitation Act—pertains to eligible veterans with disabilities, whose employability can be restored with proper training. Public Law 346—the G.I. Bill of Rights—has been designed for eligible able-bodied veterans.

The two laws differ in their general application, in that Public Law 16 gives VA a high degree of responsibility for the guidance and welfare of the disabled veteran, while the G.I. Bill holds VA's supervisory responsibility toward able-bodied trainees to a minimum.

TRAINING FOR THE DISABLED

Veterans with service-incurred or aggravated disabilities, in need of training to restore employability and make them self-supporting members of their communities, can enroll in educational institutions or on-the-job training establishments under Public Law 16.

They first must undergo extensive advisement and guidance tests and interviews by trained VA personnel in selecting their courses. The guidance continues throughout their training.

While in training, and for two months after his employability has been established, a disabled veteran may receive a subsistence allowance of $65 a month if he has no dependents or $90 a month if he has dependents, in addition to his disability compensation.

If the compensation plus the subsistence allowance does not total $105 (without dependents) or $115 (with one dependent) for a veteran with a disability rated at less than 30 per cent, an additional sum will be paid to make up the difference. The minimums for a veteran with disabilities rated at 30 per cent or more are $115 (without dependents) and $135 (with one dependent). In both categories, additional sums will be paid if the veteran has more than one dependent.

A disabled veteran taking on-the-job training under Public Law 16 may receive wages while he trains. However, if the wages plus subsistence payments exceed the journeyman rate for a trained worker in that occupation, VA will reduce the subsistence allowance proportionately. His other VA payments remain the same.

If a veteran enrolls in school under Public Law 16, VA pays for his tuition and fees, books and supplies. If he takes on-the-job training, VA provides the necessary tools and equipment.

By Nov. 1, 1947, a total of 244,780 disabled veterans were in training under Public Law 16. Of these, 136,884 were enrolled in educational institutions and 107,896 were taking on-the-job training. At the same time, 20,649 Public Law 16 trainees were declared rehabilitated. This figure accounts for only 17 per cent of the 123,613 disabled veterans who had interrupted their training for one reason or another.

TRAINING FOR THE ABLE-BODIED

Veterans in training under the G.I. Bill can choose their place of study or their job training establishment, if the institution or establishment has been approved by an appropriate state approving agency. The amount of education or on-the-job training to which these veterans are entitled depends on their length of active military service and ranges up to two years, in the case of on-the-job training of a non-apprenticeship nature, or 48 months in the case of apprenticeships or institutional courses.

If a veteran enrolls in an educational institution, VA will pay his tuition, fees, and book and supply costs up to a $500-a-year maximum. If he takes a full-time course, he will receive a $65 a month subsistence allowance if he has no dependents, or $90 a month if he has dependents. If he takes on-the-job training, he retains whatever wages are paid him, but if his salary, plus subsistence, surpasses the wage of a beginning trained journeyman, VA will cut his subsistence allowance accordingly. Also, a veteran's subsistence allowance will be reduced if his combined monthly income, subsistence and wages, totals more than $175 if he has no dependents or $200 if he has dependents.

By Nov. 1, there were 2,413,576 veterans in schools and job training establishments under the G.I. Bill. The majority of them, or 1,859,545, were enrolled in educational institutions, while the remaining 554,031 were taking on-the-job training.

At that date, some 1,892,264 former G.I. Bill students and trainees had dropped their courses. All but a mere 8,400, who had used up all their available entitlement, are eligible for further training. G.I. Bill discontinuances totaled approximately 44 per cent of the 4,305,840 who had entered training, under that program.

Most education and training, both under Public Laws 16 and 346, ends July 25, 1956. G.I. Bill education and training, for the majority of veterans, must begin before July 26, 1951.

An exception has been made for persons who enlisted between Oct. 6, 1945 and Oct. 5, 1946, under Public Law 190, 79th Congress, the Voluntary Recruitment Act. The period during which they can earn entitlement to all G.I. Bill benefits—education, training, loan guaranties and readjustment allowances—will not expire until the end of their enlistment.

G.I. LOANS

Public Law 346 (amended by Public Law 268, 79th Congress, and 239, 80th Congress) establishes provisions for the guarantee of loans or the insurance of credit, through private lending institutions, for Second World War veterans who desire to buy or build homes, purchase farms or farm equipment, or go into business. The amount of the guarantee may not exceed 50 per cent of the loan, or a maximum of $4,000 on real estate and $2,000 on non-real estate loans. If a veteran receives loans of both types, the maximum guarantee is prorated on these amounts. Farm realty loans must be paid off within 40 years; other real estate loans, within 25 years; and non-real estate loans, within 10 years. By Oct. 25, a total of 1,089,201 G.I. loans of all types, amounting to more than $6,000,000,000, had been approved for guarantee or insurance by VA.

Nearly 90 per cent of the loans, or 971,565, were for homes. These loans amounted to over $5,600,000,000; of the total, VA guaranteed and insured more than $2,600,000,000. Farm loans numbered 36,711, for a total of $141,400,334. The guaranteed and insured portion amounted to $65,421,421. Business loans reached 80,925. Principal amount of the loans was $257,517,817; the guaranteed and insured portions totaled $98,559,726.

A VA analysis of G.I. home loan figures over a four-month period (May through August, 1947) revealed that over 45 per cent of the veterans utilizing their loan guarantee privileges bought newly built houses at an average selling price of $8,200. The remaining veterans purchased homes previously occupied for sales prices averaging $6,675.

Veterans entering business with the help of guaranteed loans displayed a high degree of ingenuity. One ex-G.I. in Lowry, S. D. bought 2,000 turkey poults and necessary feed and equipment; later sold them at a large profit; repaid his loan in full nine months later. Another veteran in Minneapolis, Minn., realizing that precision gears were in short supply throughout the country, used his G.I. loan to open a manufacturing plant that immediately was flooded with orders for $300,000 worth of gears. Three Denver, Col. veterans obtained a guaranteed loan to enter the exterminating business. Starting on a small scale by exterminating cockroaches and termites in buildings, they expanded to eradicating pests in barns and graneries and to spraying fields and swamps by airplane. A veteran in Spartanburg, S. C., realizing the necessity of a diaper service after he became a father, borrowed $4,000 under the G.I. Bill to establish such a service.

The deadline for applying for G.I. loans is July 24, 1957 for most veterans except enlistees under the Voluntary Recruitment Act.

READJUSTMENT ALLOWANCES

The readjustment allowance program, established by Public Law 346 (as amended by Public Law 239, 80th Congress) provides financial assistance for eligible veterans during periods of unemployment or when self-employed and earning less than $100 a month. A totally unemployed veteran may receive $20 a week; a partially employed veteran may receive up to $20 a week, less earnings above $3. A self-employed veteran may receive $100 a month, minus any net earnings during the month. Maximum unemployment allowance entitlement is for 52 weeks; for self-employment, 10⅘ months.

Through agreements with VA, claims for readjustment allowances are handled by local public employment offices of unemployment compensation agencies in the states, territories, and the District of Columbia. A veteran wishing to apply must present his discharge or separation papers at the public employment office.

An applicant for unemployment allowances can be disqualified if (1) he leaves suitable work voluntarily without good cause; (2) he fails, without good cause, to apply for suitable work to which he has been referred; (3) he fails to attend an available free training course designed to increase his chances of obtaining a job.

During the week ending Nov. 1, 395,939 veterans claimed readjustment allowances for unemployment. During that week, state unemployment compensation offices paid out more than $7,600,000. In October, 102,757 veterans claimed self-employment allowances. State unemployment compensation offices during the month disbursed nearly $10,000,000 in self-employment claims. Allowances may be claimed through July 24, 1949, or two years after the date of discharge, whichever is later, but not later than July 25, 1952, except for enlistees under the Voluntary Recruitment Act.

MEDICINE AND SURGERY

The urgent need to expand VA's medical services to veterans, and at the same time make available medical care second to none, prompted the reorganization of the agency's Department of Medicine and Surgery. Public Law 293, 79th Congress (Jan. 3, 1946) authorized VA to employ—without regard to the civil service Classification Act of 1923, as emended—physicians, dentists, nurses, and other professional and non-professional personnel at such rates of pay as VA prescribes. The bill also authorized VA to establish residencies for physicians in its hospitals and clinics.

The medical staff of the Department of Medicine and Surgery, on Oct. 1, numbered nearly 3,500 full-time physicians; about 2,200 specialists (attending physicians and consultants); and about 1,350 Army and

Navy doctors detailed to VA for duty under the ASTP and V-12 training programs. In addition, nearly 1,950 physicians, taking part in the residency program, were serving patients on a part-time basis and were expected to join the full-time medical staff at the end of their training.

On the same date, 126 hospitals were in operation by VA, including a number of temporary structures declared surplus by the armed forces. More than 101,200 beds were available for use in VA hospitals, in addition to nearly 13,000 beds in other Federal government, state, and civil hospitals. The 101,200 beds in VA hospitals included 11,500 beds for tuberculosis cases, 55,100 beds for neuropsychiatrics, and 34,600 beds for general medical and surgical patients. VA hospitals, on Oct. 1, were offering these services for veterans with service-connected disabilities as well as for those with nonservice-connected ailments unable to pay for private treatment.

SPECIALIZED HOSPITAL SERVICES

Neuropsychiatric Service. — Well over half of all patients in VA hospitals are neuropsychiatric cases, for whom 34 hospitals are in operation. NP patients in other types of VA hospitals are treated in mental convalescent centers or special treatment centers. Eighty-six mental hygiene clinics are treating those veterans not requiring hospitalization. Thirty-four of these clinics are located at VA regional offices and 52 are contract clinics.

Tuberculosis.—VA operates 18 tuberculosis hospitals, in addition to TB departments in its general hospitals and TB-NP units in its neuropsychiatric hospitals. VA is conducting a large-scale TB case-finding program, taking a chest X-ray of each veteran as he is admitted to a hospital, and of each veteran in a VA outpatient clinic at the time of his examination. About 1,250,000 veterans are being X-rayed each year through this program; the purpose of which is to insure early diagnosis and prompt treatment. The agency, in addition, is cooperating with the Army and Navy in extended streptomycin projects.

Surgery.—Surgical facilities, available in all VA hospitals, consist of surgical operating suites and the necessary trained personnel. The Surgical Service consists of general surgery, orthopedic surgery, urology, ophthalmology, otolaryngology, audiology, plastic surgery, thoracic surgery, neurosurgery, gynecology, radiology, and anesthesiology.

General Medicine.—Seventy-four general medicine and surgery hospitals are in operation by VA. General medicine also is practiced in tuberculosis and neuropsychiatric hospitals. In addition, outpatient treatment for service-connected medical conditions or conditions aggravating a service-connected disability is available in VA regional and sub-regional offices.

Clinical Laboratories.—The services of clinical laboratories are maintained in all VA hospitals and regional offices, aiding in treatment and diagnosis. Clinical laboratories perform more than 1,200,000 examinations each month.

Dental Service.—Eligible veterans may receive dental care on an outpatient basis in VA clinics as well as from private dentists participating in VA's home-town dental care program. In-patient treatment is available at all VA hospitals for eligible patients.

Prosthetic Service.—The objective of the Prosthetic Service is to furnish the best available devices to all veterans requiring artificial limbs, hearing aids, braces, orthopedic shoes, and special equipment for the blind. In general, an eligible veteran has the free choice of appliances. A nationwide service system has been established so that he may obtain immediate repair service, up to a $35 maximum, with VA paying the bill.

Medical Rehabilitation.—As a patient's medical and surgical care progresses, he undergoes an intensive course in medical rehabilitation, designed to help him when he leaves the hospital. He must learn how to get up and down steps, on and off buses, cross streets, go shopping, and the like. If he wishes to further his education or to explore post-hospital job possibilities, complete academic programs and vocational rehabilitation programs are available.

VA HOMES

A patient, to be admitted to any of VA's 12 homes, must have a condition essentially chronic in character, not susceptible of cure or decided improvement by hospital treatment, and must be incapacitated from earning a living for a protracted period. More than 14,600 veterans were in VA homes on Nov. 1, 1947.

INSURANCE

National Service Life Insurance for servicemen and women in the Second World War was authorized by Public Law 801, 76th Congress. It could be obtained in amounts of not less than $1,000 or more than $10,000, in multiples of $500.

NSLI originally was issued on a Five-Year Level Premium Plan, which means that premiums are paid at a fixed rate for insurance protection alone; the policies do not have cash, loan, paid-up, or extended insurance values. This form of insurance obviously provides the maximum temporary protection at the lowest cost. The term period of all NSLI issued before Jan. 1, 1946, was extended three more years by Public Law 118, 79th Congress. Therefore, these policies may be continued in their original form for eight years from the date of issue.

Within the last seven years, VA wrote more than 19,200,000 NSLI policies having a total face value of over $150,000,000,000. On Oct. 1, less than one-third, or an estimated 5,956,500 policies, still were in force. Nearly 4,800,000 of these were term policies; the remainder were policies converted to the half-dozen VA permanent plans available: ordinary life, 30-payment life, 20-payment life, 20-year endowment, endowment at age 60, and endowment at age 65.

As a direct result of war casualties and other deaths, the beneficiaries of 395,544 Second World War veterans were receiving insurance payments on Oct. 1, 1947.

U. S. Government Life Insurance for First World War servicemen was authorized by amendment to the War Risk Insurance Act (Public Law 90, 65th Congress). About 4,400,000 persons applied for War Risk Insurance between Oct. 6, 1917 and Dec. 31, 1918, for an amount of nearly $39,000,000,000. Over 524,000 of these policies which had been converted to U. S. Government Life Insurance were in force Oct. 1, representing nearly $2,300,000,000 of insurance.

PENSIONS AND COMPENSATION

VA pays monthly pensions and compensation to more than 3,200,000 disabled veterans and dependents of deceased veterans. Payments range from $13.80 to $360 a month for service-connected disabilities. On Nov. 1, 1947, the following cases were on VA's compensation and pension rolls:

War	Living Veterans	Dependents of Deceased Veterans
Mexican War..........	0	45
Indian Wars...........	797	2,278
Civil War.............	83	17,895
Spanish-American War..	112,355	80,679
First World War.......	438,121	389,232
Regular Establishment..	42,692	19,291
Second World War.....	1,712,696	416,370

OTHER VA FUNCTIONS

Guardianship.—VA's guardianship load rose from 134,583 wards on Nov. 1, 1946 to 177,761 wards one year later. Of this latter figure, 93,591 were entitled to benefits because of service by veterans of the First World War and earlier wars, and 84,170 were entitled to benefits because of service by Second World War veterans.

Construction.—Since VA will have thousands of potential applications for hospital service, it has embarked upon the greatest hospital construction program this country has ever witnessed. Expected to cost over $1,000,000,000, the program will provide 91 new hospitals and a number of additions to existing hospitals. The new buildings will be located near medical centers, whenever possible, to take advantage of existing facilities for training and research.

Contact Service.—Contact representatives are located in populated areas throughout the United States and insular and overseas possessions, to advise veterans, their dependents and beneficiaries of their rights and benefits. A total of about 24,000,000 personal contacts were made by VA contact representatives during the fiscal year ended June 30, 1947.

In addition to all these functions, VA is charged with administering several lesser benefits to veterans.

THE UNITED STATES NAVY

By W. J. Lederer

Commander USN; Office of Information, Navy Department

ORGANIZATION

At the close of 1947, the administrative organization of the United States Navy was headed by John L. Sullivan, Secretary of the Department of the Navy, with W. John Kenney as Under Secretary and John Nicholas Brown as Assistant Secretary (Air). On Dec. 15, Admiral Louis E. Denfeld, U.S.N., relieved Fleet Admiral Chester W. Nimitz, U.S.N., as Chief of Naval Operations. Admiral Denfeld was, at that time, Commander in Chief of the Pacific and U. S. Pacific Fleet. His new appointment left those important positions open and forecast sweeping changes for 1948.

As of Dec. 14, 1947, the top Naval assignments were as follows: Chief of Naval Operations: Fleet Admiral Chester W. Nimitz, U.S.N.; Vice Chief of Naval Operations: Admiral De Witt C. Ramsey, U.S.N.; Deputy Chief of Naval Operations (Admin.): Vice Admiral John L. McCrea, U.S.N.; Deputy CNO (Air): Vice Admiral Donald B. Duncan, U.S.N.; Deputy CNO (Logistics): Vice Admiral Robert B. Carmey, U.S.N.; Deputy CNO (Operations): Vice Admiral Forrest P. Sherman, U.S.N.; Deputy CNO (Personnel): Vice Admiral William M. Fechteler, U.S.N.; Judge Advocate General: Rear Admiral Oswald S. Colclough, U.S.N.; Chief, Bureau of Naval Personnel: Rear Admiral T. L. Sprague, U.S.N.; Chief, Bureau of Ships: Vice Admiral Earle W. Mills, U.S.N.; Chief, Bureau of Ordnance: Rear Admiral Albert G. Noble, U.S.N.; Chief, Bureau of Aeronautics: Rear Admiral Alfred M. Pride, U.S.N.; Chief, Bureau of Supplies and Accounts: Rear Admiral Walter A. Buck, U.S.N.; Chief, Bureau of Yards and Docks: Rear Admiral John J. Manning, U.S.N.; Chief, Bureau of Medicine & Surgery: Rear Admiral Clifford A. Swanson, U.S.N.; Commander, Pacific Fleet: Admiral Louis E. Denfeld, U.S.N.; Commander, Naval Forces Western Pacific: Admiral Charles M. Cooke, Jr., U.S.N.; Commander, Atlantic Fleet: Admiral W. H. P. Blandy, U.S.N.; Commander, Naval Forces, Eastern Atlantic & Med.: Admiral R. L. Conolly, U.S.N.; Commandant, Marine Corps: General Alexander A. Vandegrift, USMC (relieved Jan. 1, 1948 by Major General Clifton B. Cates.)

Overall command of the Naval Operating Forces devolves on the Chief of Naval Operations subject to the supreme authority vested in the President of the United States by the Constitution, and in the Secretary of the Navy by law. The Chief of Naval Operations is the principal Naval Adviser to the President and the Secretary of the Navy. In this connection, it is to be noted that in the discharge of his duties as the principal Naval Executive, the Chief of Naval Operations is responsible for executing the directives of the Joint Chiefs of Staff in so far as they affect the Navy; and under the Unified Command Plan, the Chief of Naval Operations is the executive agent for Joint Chiefs of Staff for the Pacific Area as is the Chief of Staff, U. S. Army for the Far East and Alaskan Areas.

OPERATION FORCES

The Operating Forces of the Navy are organized for administration into two principal fleets—the Atlantic and Pacific, each under a Commander-in Chief. Tactical and area commands are maintained in accordance with current deployment and assignment of tasks.

The Atlantic Fleet provides units for support of the United States occupation forces in Europe and for the support of the United States policy in the Atlantic with appropriate deployments in the Eastern Atlantic and Mediterranean. The Pacific Fleet provides units for the support of the United States occupation forces in Japan and Korea and for the support of United States policy in the Pacific. Units assigned duty on foreign stations are rotated at approximate six month intervals in order to maintain morale without moving large numbers of dependents overseas and in order to maintain thorough and uniform standards of personnel and ship training without the expensive establishment of training services at many scattered locations. Visits are made by naval forces to the areas in which the United States has important interests and to foreign ports as required for reasons of policy.

The Atlantic and the Pacific Fleets each contain in being a carrier striking force, an amphibious force, a fleet marine force, a submarine force, and units required for naval reconnaissance and anti-submarine warfare. Each fleet carries on: (a) Active duty training of naval reservists; (b) amphibious training of Marine and Army troops; (c) effective adaptation to fleet use of the latest weapons and techniques, both in offense and defense; and (d) operations to improve efficiency of personnel and effectiveness of material under extreme climatic conditions.

SHIPS OF THE U. S. NAVY

Estimated total tonnage, Atlantic Fleet	1,305,590 tons
Estimated total tonnage, Pacific Fleet	1,352,602 tons
Estimated total tonnage, Atlantic Reserve	2,465,481 tons
Estimated total tonnage, Pacific Reserve	2,306,368 tons
Value of ships of the two Reserve Fleets	$12,000,000,000
Estimated cost of inactivating ships	$38,000,000
Annual maintenance costs	$6,000,000

ATLANTIC FLEET TACTICAL EXERCISES

Large scale battle exercises were held by the Atlantic Second Task Fleet in the Caribbean and Central Atlantic during the period Feb. 3-March 18, 1947. Because of the large number of new recruits, this extensive training exercise was considered essential to the battle efficiency of the Fleet, and 133 ships were assigned to the operation. The exercises were under the command of Admiral W. H. P. Blandy, U.S.N., and Vice Admiral A. W. Radford, U.S.N.

EXERCISE SEMINOLE

A joint Army-Navy-Air Force training operation, involving an amphibious assault on a Florida Gulf beach, was carried out during the first week of November. More than a score of ships of the Amphibious Force, U. S. Atlantic Fleet, made up the Naval components which were under the command of Rear Admiral R. O. Davis.

OPERATION CAMID II

Midshipmen of the U. S. Naval Academy and Cadets of the U. S. Military Academy participated in a series of amphibious warfare training exercises in the Chesapeake Capes area during the period Aug. 12

through Aug. 23. The operation was complete with live gunfire and Air Force and Marine Corps air bombardment.

The year 1947 was important in training in the Navy with amphibious and Fleet exercises in the Pacific. Bikini was visited by a Scientific Resurvey which made exhaustive examination of the atoll, its lagoon, and the sunken ships resting there in an attempt to answer important scientific questions. Another feature of the year was a resumption of the Midshipmen Cruise to Europe and the carrying out of numerous Reserve training cruises.

NAVAL RESEARCH

The Office of Naval Research has initiated 648 fundamental research projects that reach out into every field of basic science. Many of the country's outstanding scientific authorities are at work on this program. Included are mathematics, physics, nuclear physics, chemistry, metallurgy, electronics, fluid mechanics, geophysics, microbiology, physiology, biochemistry, humanecology, biophysics, psychology, and psycho-physiology.

Although actual research under this program has been underway only a little more than two years, important advances in science have already been made. While improved and new weapons may evolve from these scientific advances, more important results are the additions to the fund of basic scientific knowledge and the corresponding ultimate benefits to man in every walk of life.

During the year, Navy cameras were carried 100 miles above the earth aboard a V-2 rocket at White Sands, New Mexico, in collaboration with the Army, to take the first pictures in existence of the solar spectrum in the far ultra-violet, and to record what the earth looks like from heights never before reached by a camera.

Navy-equipped B-29's were fitted out as scientific laboratories to take scientists high above the clouds to search for new knowledge; the most powerful atom-smashers known, cosmic rays, have thus been photographed. This information is expected to be helpful in the instrumentation and use of man-made atom-smashers, such as the synchrotron.

In the field of metallurgy, new materials are being devised. New chromium base alloys are being developed that show promise of withstanding temperatures as high as 1600 degrees Fahrenheit, far above the pre-war operating temperature of heat engine. These materials will be valuable in the operation of jet-propelled planes as well as to industry for such items as power plants and gas turbine locomotives. The use of radioactive isotopes is making a far-reaching contribution to the field of metallurgy.

New eight-inch turret guns, adapting rapid automatic features to large guns, have been developed. The principle of automatic fire also has been applied to a six-inch dual-purpose gun, and a new three-inch, 50-caliber anti-aircraft weapon.

Newer aircraft fire-control systems to give further improved gunnery and bombing accuracy also are under development. Guns and mounts are still being redesigned and improved to give faster and more accurate hitting power. New rockets are being designed to have greatly increased velocity, more effective heads, and improved accuracy in flight. Other research and development projects pursued during 1947 include guided missiles, improved torpedoes, improved mines and other anti-submarine weapons, ammunition, and ammunition details.

NAVY ANTARCTIC EXPEDITIONS

In early 1947 the Navy sent a 13-ship, 4,000-men expedition under the leadership of Rear Admiral Richard E. Byrd to the Antarctic regions. This expedition, which departed from the United States in late 1946, was officially designated as Operation Highjump. The missions of Operation Highjump were to chart Antarctica, to make scientific research, and to test the functioning of naval equipment and personnel in the rigorous Antarctic conditions.

Approximately 50 scientists representing many activities participated in the expedition. The following agencies were represented: Army, Army Air Force, Weather Bureau, Coast and Geodetic Survey, Coast Guard, United States Geological Survey, Hydrographic Office, Woods Hole Oceanographic Institute, and Fish and Wildlife Service. About 1,700,000 square miles of Antarctica were investigated. Of this, nearly 1,500 miles of new coastline were charted.

In late 1947 the Navy despatched another expedition to the South Polar regions. This time it consisted of two ice breakers only. The mission of this group is to further the research started by the large Byrd expedition.

For detailed information on Operation Highjump see: "Our Navy Explores Antarctica" by Rear Admiral R. E. Byrd (Oct. 1947, *National Geographic Magazine*); "Antarctic Fairyland," by T. R. Henry (May 10, 1947, *Saturday Evening Post*); "Antarctic Oasis" (September 1947); Dead Men's Diary," by Owen McCarty (May 17, 1947, *Saturday Evening Post*); "Report from Antarctica," by T. Henry (June 1947, *Popular Mechanics*); and "Who Owns Antarctica," by W. J. Lederer and S. V. Jones (Dec. 13, 1947, *Saturday Evening Post*).

NAVAL AVIATION

Two new aircraft carriers were commissioned during 1947—the *Coral Sea* and the *Wright*, the former of the *Midway-F. D. Roosevelt* class. Two war-tested veterans, the *Randolph* and the *Shangri-La*, were retired to the inactive fleet. The *Oriskany* is under construction in New York.

Carrier activity included the V-2 bomb launching from the *Midway*, the first long-range bombardment rocket to be fired from a moving platform. The first conventional type transport planes to be flown from a carrier took off with JATO (Jet Assisted Take-Off) from the Philippine Sea down in the Antarctic and landed on skis on the snow "runways" of Little America.

The biggest 1947 news in blimps was the transfer of all lighter-than-air from the western to the eastern seaboard. Six blimps bucked headwinds, storms, hot air over the deserts, and hurricanes on the trip from Santa Ana, California, to Weeksville, North Carolina, and Lakehurst. The fastest trip took 50.3 hours. During the year, blimps participated in exercises against submarines with both Atlantic and Pacific fleet units. A new type airship, embracing a streamlined undercarriage partially "buried" inside the bag, is being studied for future construction.

Throughout the year, the Naval Air Transport Service flew 40,000,000 passenger miles per month without a single passenger fatality. Peak transport operation occurred in July when 2,067,557 miles were flown and 9,451,448 ton-miles lifted. In the previous month, as a sideline, NATS (Naval Air Transport Service) ferry pilots flew 1,000 planes to other parts of the country.

SAFETY RECORD

A large part of the credit for the safety record of NATS goes to its continuous use of Ground Control Approach, generally spoken of as GCA. All pilots are ordered to practice a GCA simulated instrument approach at every landing where equipment is available. An additional safety measure employed is radar obstacle warning equipment which permits pilots to "see" storms or more solid obstacles under poor visibility conditions.

During the cholera epidemic in Egypt, NATS flew five tons of serum and medical supplies into the stricken area within 24 hours after the Egyptian Government requested help from the United States.

STUDY OF JET PROPULSION MAINTENANCE

The advent of jet propulsion has presented the Navy with an additional maintenance problem. To augment its technical training schools, key personnel have been assigned to civilian industrial plants to study jet engines. Outstanding in the new maintenance techniques which came to the fore during the year was atomic hydrogen and inert gas welding.

FLIGHT STUDENT TRAINING

During the first nine months of 1947, a total of 1,208 flight students completed the training course and 272 officers and 11,425 enlisted personnel graduated from technical training schools. Pensacola, as prior to the war, became the hub of pilot training, absorbing pre-flight training formerly given elsewhere. At the close of the year, 1,000 midshipmen were under instruction at Pensacola, plus 450 officers, 50 enlisted men, 60 Marines, and 50 foreign pilots. Technical training facilities for enlisted personnel were consolidated at Memphis with the transfer of 15 schools from other locations.

The Navy maintains a force of approximately 8,000 aircraft in operation, including fleet, training, and Reserve. To support these operating aircraft, about 7,000 more aircraft are in storage, pool, or overhaul activities. Long term preservation of aircraft or "canning" of planes is getting underway with the construction of steel containers to house and protect non-operating aircraft.

PROGRESS IN AEROLOGY

Important achievements in the science of aerology were recorded with the development of radiophoto and facsimile transmission of weather maps. Pictures of the weather from China's coast to Washington are now available over a radiophoto network tying in long-range transmitters at strategic stations across the nation and the Pacific. Maps can be ready 20 minutes after they are delivered for radio transmission.

Progress was made in instrumentation for gathering upper atmosphere data—50,000 feet and up, and 2,000 gram balloons were produced which can attain 100,000 feet and carry meteorological instruments to that height. Numerous air stations were equipped with photoelectric ceilometers which automatically measure and continuously record the height of cloud ceiling over an airfield with absolute accuracy.

From the public's viewpoint, one of the prize aerology projects of the year was *Project Cirrus,* rain making by sowing particles of dry ice in supercooled cirrus clouds. The project is a joint one with General Electric and the Air Forces.

Navy weather squadrons cooperated with other services in tracking a severe Florida hurricane during September. Reconnaissance planes spotted it and made regular flights into the eye of the storm, gathering data which assisted in warning residents to evacuate threatened areas. At night, radar equipped planes followed the storm when weather recco planes were not able to operate effectively. These flights kept the hurricane pin-pointed as it moved and gathered reliable data.

Naval Aviation participated in three expeditions during 1947—the Antarctic exploration of Operation High Jump, the Bikini Scientific Resurvey, and an Arctic weather project. Transport planes, helicopters, and patrol planes flew over more than 340,000 square miles of icebound territory never before seen by man, plus 75,000 square miles of ocean. Navy photographers recorded topographical features of the vast sub-continent on 64 flights. For the first time, the nature of the rock under the ice cap was revealed by the airborne magnetometer, the weapon used to detect submerged enemy submarines during the war.

PHYSIOLOGICAL PROBLEMS

Tremendous speed at heretofore unexplored altitudes, accelerated takeoffs, and rapid climb have placed scores of physiological problems in the lap of aviation medicine. A two-year plan was formulated to parallel anticipated engineering developments. New instruments of research were developed and installed, including a deceleration tower that will aid the Naval Medical Research Institute in developing protection against high speed crashes. A human catapult that will test human tolerance to accelerated takeoffs and arrested landings is nearing completion, and work was begun on a human centrifuge, the largest in the world, capable of duplicating typical normal and emergency flight patterns.

Sixteen reports on new discoveries as to why aviators frequently become disoriented and sometimes crash as a result were made at the Pensacola School of Aviation Medicine and Research. The school has also followed the leads gained in Project Everest when four men lived in a low pressure chamber at simulated high altitude for 30 days.

The Research Institute and the Aero Medical Equipment Laboratory worked together on a biological study of jet engine noise and vibration. Studies were also made in ways to bail out from a plane in flight with pilots in full flight clothing, simulating bail-outs into nets, to work out the most satisfactory methods of exiting from a cockpit without injury.

The Navy's training program for Air Reservists successfully survived its shakedown period early in the year, and in June, top month of the year, 122,075.3 pilot hours were logged as compared with 18,223.6 in the previous September, the best month in 1946.

SPEED RECORD

One of the highlights of the aviation year was the breaking of the world's speed record by Commander Turner Caldwell, U.S.N., and Major Marion Carl, USMC. Their plane, the *Skystreak* (Douglas D-558 trans-sonic research plane), reached a top speed of 650.6 miles per hour.

BUREAU OF SUPPLIES AND ACCOUNTS

Reductions in personnel and facilities and a readjustment of procedures and workload to supply a peacetime Navy characterized the fiscal year of 1947. A policy of centralized management and decentralized operation was put into effect to take advantage of wartime lessons and experience.

The Navy participated in the program to store strategic and critical

AVIATION RECORDS SET BY THE U. S. NAVY

(Oct. 1946–Aug. 1947)

Type Record	The Record	Date	Place	Type Aircraft	Pilot
World's long distance non-stop flight	11,236 miles in 55 hrs., 17 minutes	Oct. 1, 1946	From Perth, Australia to Columbus, Ohio	*Truculent Turtle*, a P2V Lockheed Neptune, Navy Patrol Plane	Thomas Davies Comdr. USN and crew
National Altitude Record from a standing start to 10,000 feet	1 min., 34 seconds	Nov. 20, 1946	Cleveland, Ohio	*Bearcat* F8F Grumman Navy Fighter Plane	N. W. Davenport Lieut. Comdr., USN
World's speed record	640.7 mph.	Aug. 25, 1947	Muroc Air Station, California	*Skystreak* D-558 Douglas Trans-sonic research plane	Turner Caldwell Commander, USN Marion Carl Major, USMC
Maximum endurance record (without refueling)	170.3 hrs. in flight	Took off Oct. 27 and landed Nov. 3, 1946	Lakehurst, New Jersey	XM-1 lighter-than-air ship	H. R. Walton Lieut., USNR and crew

materials for a National Stockpile supplying 109,200 square feet of covered space, 905,000 feet of open space. The total eventually to be supplied by the Navy is 393,676 of covered, and 8,203,400 of open space.

Navy expenditures for fiscal 1947 were $5,577,000,000; estimated expenditures for 1948 are $4,250,000,000. The total military payroll was $1,751,000,000; for civilian payroll, $1,077,000,000. In the one month of April 1947, there were 1,187,948 allotments and family allowances totaling $39,157,599.08. The Navy sold more than 4,000,000 bonds in fiscal 1947 worth $98,500,000. In the year, the Purchase Division awarded 13,105 contracts and orders representing a round figure of $250,000,000.

The problems of feeding the men of the Navy can be seen in the following statistics of food consumed in 1947: biscuits, flour, bread, 55,954,600 lbs.; meat, 110,087,860 lbs.; vegetables, 229,076,850 lbs.; fruit, 33,952,570 lbs., and eggs 10,084,310 dozens.

BUREAU OF MEDICINE AND SURGERY

By the middle of 1947, the number of hospitals operated by the Navy had dropped to 32 through the disestablishment of 13. The bed capacity on July 1, 1947 was 24,600. The hospital patient load at this time was 17,000. The wartime patient backlog has disappeared. Care for the dependents of Naval personnel was requiring an increasing service by the Medical Department.

The low death rate of 2 per 1,000 for all causes is indicative of the lowest disease rate in the history of the Navy and of the improved methods of treatment.

Research activities are located at Bethesda, Md.; Pensacola, Fla.; New London, Conn.; Camp Lejune, N. C.; Dublin, Ga.; Guam, and Cairo, Egypt. Research projects being carried on at these places include among many others: (a) prevention and treatment of diarrheal diseases and dysenteries, streptococcal diseases and rheumatic fever, and control of airborne infections; (b) in aviation medicine, physiological problems arising from high speed, high altitude aircraft, including the effects of rapid acceleration and deceleration, and ultrasonic vibration in jet-propelled aircraft, human factors in aircraft design, and the biomechanics of aviation crash injuries and protective measures; (c) in submarine medicine, physiological problems in habit-ability of submarines, especially air-conditioning, odor control, and optimum levels of oxygen and carbon dioxide, problems in vision and hearing, especially as they apply to lookouts and sonant operators; and (d) medical aspects of atomic energy.

In cooperation with the Bureau of Ships, projects and studies are being continued on decontamination methods, radiological safety, handling and disposal of radioactive material, radiation sickness and injuries, and the design of monitoring instruments.

NAVAL CONSTRUCTION AND EQUIPMENT

By John C. Niedermair
Bureau of Ships, Navy Department

GENERAL

The article on this subject in The American Year Book for the year 1946 covered, in considerable detail, various predictions regarding the future types of naval vessels which apply equally well to the year 1947. Since the Secretary of the Navy's Annual Report for 1946 was not released for publication until June 1, 1947, it is necessary to include much of the Bureau of Ships portion of that report in this review for 1947. This will place on record the only official information which was made available on naval construction during the period covered by this review.

NAVAL APPROPRIATIONS—1947 AND 1948

Congress authorized a cash outlay of $3,268,766,100 for the fiscal year 1948 (July 1947 to July, 1948). In addition, the Secretary of the Navy was given authority to contract, prior to July 1, 1948, for $248,000,000 in aircraft new construction, procurement, and equipment, including spare parts and accessories. The regular, annual, and supplemental appropriations for the fiscal year 1947 was $4,332,781,951 including rescissions. In his budget estimate for 1948, President Truman recommended an outlay of $3,513,000,000 for the Navy. The 1948 appropriation includes $320,000,000 for the Bureau of Ships maintenance expenditures; $184,000,000 for the Bureau of Ordnance, Ordnance and Ordnance stores expenditures; $9,700,000 for the construction of ships; and $4,580,000 for ordnance new construction.

POST-WAR CURTAILMENT IN SHIPBUILDING

After V-E day, and the prospective transfer of the Atlantic units to the Pacific, it was evident that a cutback in the shipbuilding and conversion program could undoubtedly be entertained, and the major activity of the Bureau of Ships during the fiscal year 1946 was in connection with the slowing up of the shipbuilding program, the ever increasing maintenance requirements of the fleet, the preparations for and de-activation of the vessels not needed to be kept in commission after V-J day, and the preparations for the Bikini atomic bomb tests.

During the fiscal year 1946 the shipbuilding program was primarily aimed at completing the approved national defense program. During 1946, only one new type of vessel appeared, namely, the *Midway* class of large carriers with the protected flight deck and armed with the new 5-inch 54-caliber long-range anti-aircraft battery. The adjoining table clearly shows how the shipbuilding and conversion program came to its peak in 1944 and was scheduled to run out at approximately July 1, 1946.

CUT-BACKS IN SHIPBUILDING PROGRAM

During July 1945, in accordance with provisions of section 202, Public Law 458 (78th Cong.) known as the War Mobilization and Reconversion Act of 1944, the Secretary of the Navy directed a study to be made of the naval shipbuilding program to ascertain what contracts, if any, could be terminated. At that time the rate of naval construction and conversion, which had reached its peak during 1944, had dropped to less than one-half of the 1944 rate, and most of the outstanding contracts were scheduled to be completed by the end of the fiscal year 1946. As a result of this study, the Secretary of the Navy on Aug. 10, 1945 directed that contracts for 56 combatant vessels, 14 auxiliaries, and 25 mine craft should be terminated. Although the cut-back based on this study was directed on Aug. 10, 1945, the cut-back was not given publicity until after V-J Day. Immediately thereafter, a further review of the shipbuilding program was instituted by the Secretary of the Navy and by Aug. 18, 1945, additional terminations were ordered of 17 auxiliaries, two large landing craft, 36 PT boats, 9,600 small landing craft and boats, 101 district craft and 24 transports, cargo ships and oilers, being built for the Navy by the United States Maritime Commission.

These pre-V-J and V-J Day terminations, totaling over 9,800 vessels and craft, resulted in a reduction in future expenditures of over $1,250,000,000. To consummate these terminations, the Government had to abandon, except for salvage value, an equity of about $950,000,000 in the uncompleted vessels.

After V-J Day, reviews of the outstanding shipbuilding programs were

[1] Includes vessels delivered incomplete.

Note: All figures above include new construction, acquisitions, and conversion of private or U. S. Maritime Commission vessels for naval operation.

made in October and November 1945 and in January and March 1946. As a result of these reviews, which were made in collaboration with the Director of War Mobilization and Reconversion and the Congressional Naval Affairs Committee, 38 additional vessels were terminated and the construction of 17 vessels was held up. The vessels held up were accepted in an uncompleted condition and held in an "as is" condition for possible future completion.

DEMOBILIZATION OF THE FLEET

Since the end of conflict in September 1945, in the interest of national economy, it became necessary to demobilize, in large measure, the largest fleet of ships ever built. Such a program was initiated accordingly and was well under way by the end of the year.

There were 2,027 vessels of representative types assigned to the reserve Sixteenth and Nineteenth Fleets for inactivation, including 99 vessels to be disposed of by sale, scrapping, and designation as historical relics. Of those assigned, 1,529 vessels had reported and were in various stages of inactivation and 582 vessels were inactivated by June 30, 1946. The inactivation of these reserve fleets was about 40 per cent completed, with final completion of the present program anticipated about Sept. 30, 1947, except for district craft, etc., which were employed to inactivate other vessels.

Approximately 6,800 vessels were to be declared surplus to the needs of the post-war Navy, of which 3,447 vessels were declared surplus and available to disposal agencies, comprised of the Maritime Commission, War Shipping Administration, Naval Material Redistribution and Disposal Administration, and the Office of Foreign Liquidations Commissioner. Of those declared surplus, 1,697 were transferred to new owners, or scrapped, while the remainder awaited disposal instructions from appropriate disposal agencies.

SHIP MAINTENANCE AND REPAIRS

Operations in the far Pacific after the surrender of Japan resulted in severe typhoon damage to vessels in that area. This demand for maintenance and repair was followed by upkeep requirements which resulted from four years of war, during which time was not available for the accomplishment of normal maintenance. The character of maintenance overhauls changed after the surrender of Japan. During the war, overhauls were usually accomplished in connection with battle damage repairs or changes in the military characteristics of ships. Following the war, there was a period when alterations practically ceased. Maintenance and overhaul work consisted mostly of urgent repairs usually on a voyage repair basis. Near the end of the fiscal year, plans had progressed so that the active ships would then come into the shipyards for overhauls on a periodic, measured-time basis. Overhaul schedules necessarily non-existent during the war or the period immediately after the war were prepared, covering two years in the future.

Of necessity the extent of such repairs and alterations was restricted to essentials. Immediately after the surrender, the Navy was called upon to move an unprecedented number of men and equipment home. The preparation for this assignment (Magic Carpet), involved changes for personnel accommodations to all types of vessels from aircraft carriers to escort vessels. Operations Crossroads also imposed a heavy demand upon facilities in preparing various vessels for target and support forces for the Bikini tests and resultant explorations.

The material condition of the fleet and its operational reliability during four years of war was beyond expectation. The material improvement program should provide the post-war fleet with that qualitative supremacy in design, striking power, range, mobility, and equipment, without which mere numerical supremacy is meaningless.

NEW DESIGNS AND RESEARCH DEVELOPMENTS

Though limited by restrictions concomitant with the cessation of hostilities, the Bureau of Ships has pursued the research and development problems to the utmost. With the cessation of hostilities, the Bureau of Ships' design effort shifted from the prosecution of work connected with the shipbuilding program and other related wartime activities to new studies and programs brought about by war and post-war developments. Rapid progress in the field of guided missiles, submarine propulsion systems, the advent of the atomic bomb, and other scientific achievements have necessitated a re-examination of characteristics of existing types of warships and exploratory studies of entirely new types of vessels. As naval vessels are necessarily complex assemblages, they are not easily changed in fundamental design or built in a short time. Hence, during the war, most of the major ships built were from fundamental designs conceived during the period from 1933 to 1941. This was justified from a ship propulsion and resistance to damage point of view for two reasons: (1) United States designs were believed to be and generally proved to be far in advance of those of our enemies or allies; (2) maximum production was required, which precluded radical design changes. Just as the forward thinking of 1933 and construction of prototype vessels permitted us to build the greatest Navy the world has ever seen, the present period must see the development of advanced and new concepts in naval design.

NEW CONSTRUCTION AND CONVERSIONS

In 1946, the Navy suspended construction on the 45,000-ton battleship *Kentucky* and the 27,000-ton cruiser *Hawaii* pending design changes which would make them the first guided missile warships.

During 1946 and early 1947, three new heavy cruisers were launched—the *Des Moines, Salem,* and *Newport News.* Displacing 17,000-tons, they will be the "heaviest" heavy cruisers afloat. Their new rapid-firing 8-inch guns will permit a rate-of-fire several times greater than was possible in the 13,600-ton *Baltimore* class heavy cruisers which saw service during the war. During 1947, the world's "heaviest" light cruisers were also launched —the 14,700-ton *Worcester* and *Roanoke.* Mounting new dual-purpose 6-inch guns and scores of lesser anti-aircraft guns, they will provide far more effective anti-aircraft defense than their wartime predecessors, the 10,000-ton *Cleveland* class light cruisers.

Early in 1947, Congress authorized the construction of two new high-submerged speed submarines—the *Tang* and the *Trigger.* When completed in 1951, the *Tang* and *Trigger* will be the world's fastest combat submarines. Hull, contract, and machinery plans are being prepared by the Portsmouth Naval Shipyard. Other submarines are being altered to include modern developments. Other conversions also were authorized by the Congress in 1947. Nine 2100-ton *Fletcher* class destroyers will be converted into high-speed destroyer escorts. Emphasizing the growing importance of undersea warfare, these high-speed destroyers are needed to provide adequate anti-submarine defense against the new high-submerged speed submarines. In addition, two submarines will be converted into troop carriers, one submarine will become a cargo carrier, and another submarine will be converted for Arctic picket service. To provide prototypes for the study of amphibious operations in polar regions, two LSDs (Landing Ship, Dock) and one cargo ship will also be converted for polar service.

RESEARCH

Since V-J Day, the Navy has been supporting an extensive fundamental research program which already is paying dividends in important new scientific discoveries of benefit to both the civilian economy and the armed services. Three months before the atom bomb fell on Hiroshima, Secretary of the Navy James Forrestal established the Office of Research and Inventions (now the Office of Naval Research) to "keep the nation scientifically prepared." The Office of Naval Research already has initiated over 600 fundamental research projects that reach out into every field of basic science, and many of the country's outstanding scientific authorities work on this program.

Projects are under way in every field of science including mathematics, physics, nuclear physics, chemistry, metallurgy, electronics, fluid mechanics, geophysics, bacteriology, physiology, biochemistry, environmental biology, biophysics, psychology, and psycho-physiology. Although actual research under this program has been under way only a little more than one year, important advances in science have already been made. While improved and new weapons may evolve from these scientific advances, more important results are the additions to the fund of basic scitific knowledge and the corresponding ultimate benefits to man in every walk of life.

Navy-equipped Army B-29s also have been fitted out as scientific laboratories to take scientists high above the clouds to search for new knowledge. The most powerful atom-smashers known, cosmic rays, have thus been photographed and have yielded information which has been helpful in the instrumentation and use of man-made atom-smashers, such as the synchrotron.

In the field of metallurgy, new materials are being devised. New chromium base alloys are being developed that show promise of withstanding temperatures as high as 1,600 degrees Fahrenheit far above the pre-war operating temperature of heat engines. These materials will be invaluable in the operation of jet-propelled planes but will also have many benefits to industry and to the public such as improved engine performance, new power plants, and gas turbine locomotives.

ORDNANCE

While new weapons are being studied and developed on a long-range program and present weapons are being improved or modified on a short-range plan, the Navy's Bureau of Ordnance has stored up a vast supply of the best weapons with which the Second World War was won and has these available should a new emergency arise. This war reserve, amassed through a careful appraisal of weapons and ammunitions, already has resulted in the storage of approximately $1,750,000,000 worth of ordnance equipment as a form of national defense insurance.

New eight-inch turret guns, developed since V-J Day as part of the Bureau of Ordnance program of adapting rapid, automatic features to large guns, will fire at battle ranges approximately four times faster than any gun of the same or larger caliber. The principle of automatic fire also has been applied to a six-inch, dual-purpose gun, and a new three-inch, 50-caliber anti-aircraft weapon. The rate of fire of the new six-inch gun, the first rapid-fire anti-aircraft mount of its caliber, has exceeded by a wide margin its original design specifications. Automatic, from ammunition handling rooms to gun muzzles, the new eight-inch batteries eject cartridge cases from the mounts, powder bags having been abandoned in favor of cartridge cases to achieve the desired high rate of fire.

For the first time in any Navy, the difficult job of gun turret ammunition handler has been eliminated in the eight-inch gun once the ammunition has left the stowage level. The new design includes some ammunition handling features both American and foreign, which, although originally developed for other mounts, have been combined with entirely new features to achieve an efficiency of handling arrangements that has resulted in an unprecedented firing-rate.

NEW CARRIER COMMISSIONED

Last in a class of the Navy's three largest ships in point of sheer bulk, *USS Coral Sea* has joined American sea forces five and a half years after the battle for which she was named.

The new CVB, along with sister ships *Midway* and *Franklin D. Roosevelt,* is too large to pass through the Panama Canal. She was launched in October 1947 and will be completely outfitted by January 1948.

Two other carriers, CVE 57 and CVB 42, were first assigned the name *Coral Sea.* CVE 57 became *USS Anzio* and CVB 42 became *Franklin D. Roosevelt.*

Braced against chilly winds whipping across the massive flight deck, the 3,500 crew members were told by the Secretary of the Navy John L. Sullivan in the commissioning address that "the strength and the determination of the United States will be judged not only by this fine ship with its remarkable equipment, but even more by the way you handle it, and by you yourselves."

It is entirely fitting that the name of the famous battle be assigned to a carrier since the Battle of the Coral Sea was the first major naval engagement in history in which surface vessels did not exchange gunfire. Losses on both sides resulted from aircraft attacks.

The *Coral Sea* is 968 feet long, with a beam of 113 feet at the waterline. She is rated at more than 33 knots and has an armament of 18 5-inch 54s, 84 40-mm, and 28 20-mm.

THE STEAM-PROPELLED LST

The Navy's new LST 1153, featuring steam propulsion which provides several more knots in speed over wartime LSTs, was commissioned at the Naval Shipyard in Boston, Mass.

In addition to incorporating a turbine drive, the new vessel features many improvements over the landing craft which saw extensive service in the Second World War. LST 1153 measures 382 feet in length, 55 feet longer than previous craft. Two 5-inch 38-caliber guns give the vessel heavier fire power. Crew and troop quarters are larger, and tank, truck, and cargo capacities are increased. On deck, heavier types of vehicles developed since the war may be carried. A more shallow draft at the bow will permit beaching more easily, and cargo booms are installed to aid in unloading cargo. The vessel carries four small landing craft. The ship's complement consists of 82 officers and enlisted men.

SALE OF COMBATANT VESSELS

Some 400 combatant vessels, many showing marks of war and old age, were auctioned off in the virtually completed Navy disposal program. Having been determined surplus to future needs of the Navy's active and reserve fleets, 55 vessels were sold for use by the buyers and the remainder for scrap. Thirty-one CVEs were sold for use, along with 10 DEs and 14 frigates, after buyers had been carefully scrutinized to insure that the vessels actually would be converted to cargo ships.

Buyers were required to remove flight decks from the carriers and, except in notable instances when the Navy made sure the guns could never be fired, all armament and other military features were stripped from the vessels.

The carriers, mostly with C-3 hulls, could be converted to cargo vessels easily. The program is a boon to American shipyards, whose personnel might otherwise find considerably less work in these times.

The vessels which are being broken up for scrap by private shipbreaking companies will assist in relieving the critical scrap shortage. A total of almost 600,000 tons will be realized from the Navy combatant vessels.

The highest price received for any single vessel was $380,000 for the *New Mexico.* Old four-stackers, on the other hand, went for as low as $8,000 to $10,000.

Other battleships sold were the *Oklahoma,* which sank while being towed to the United States from Pearl Harbor, and the *Idaho* and

Wyoming. Five light cruisers of the *Omaha* class were put on the auction block—*Trenton, Concord, Richmond, Detroit,* and *Memphis.*

Two veterans of the attack on Pearl Harbor, *Cassin* and *Downes,* were sold as scrap along with 122 other destroyers. Among the 50 aircraft carriers, 36 of which had seen service in the British Navy under Lend-Lease, was the old warrior *Ranger.* Others sold were 111 DEs, 59 submarines, six eagles, and 60 frigates.

Large numbers of landing craft, not considered as combatant vessels, were turned over to the Maritime Commission for disposal.

V-2 ROCKETS LAUNCHED FROM MIDWAY

Not long ago, the world had a look into the future when the U. S. Navy launched a captured German V-2 rocket from the aircraft carrier *USS Midway.* This was the first time in history that a large bombardment rocket had been fired from either a ship or a moving platform. Although the 45-foot, 14-ton missile exploded after traveling only six miles, Navy officials hailed the experiment as successful. The primary purpose of the experiment was to ascertain if large bombardment rockets could be fired from modern aircraft carriers without requiring modifications that would affect flight operations. The modifications made on the *Midway* for the rocket-launching platform had no effect on flight operations.

Previous firing of V-2 rockets had been made by the Army at the White Sands proving grounds in New Mexico. The average distance of vertical flights made by V-2s in New Mexico was 85 miles, while the established record is 114 miles.

This gives a clear outlook on the position Navy ships will play in future wars. With the present maximum gun range of about 20 miles, Navy ships making shore bombardments are easy targets for long-range shore batteries. However, with the aid of rockets, the firing range of ships can easily be increased to almost 200 miles, placing every coastline in the world within easy range of destructive rocket weapons.

Presently the Navy is planning to have two guided-missile ships. The battleship *Kentucky* and the cruiser *Hawaii* are being constructed for such purposes. It is anticipated that more V-2 rockets will be fired before such launching platforms will definitely be installed in the *Kentucky* and *Hawaii.*

"This launching," said Rear Admiral D. V. Gallery, USN, Assistant Chief of Naval Operations for Guided Missiles, who witnessed the firing of the V-2 rocket from *USS Midway,* "will mark the beginning of a new era in naval weapons."

Elaborating on the future possibilities of rocket-carrying Navy ships, Vice Admiral Forrest P. Sherman, USN, Deputy Chief of Naval Operations, commented that such ships would lend great support to land military operations by extending the range of ship bombardment many miles inland.

SAVINGS BY COMMON USE OF FACILITIES

Savings amounting to more than $1,000,000 per year by the common use of Army-Navy-Air Force facilities were cited as possible in a report prepared by Vice Admiral Robert B. Carney, USN, Deputy Chief of Naval Operations for Logistics. Some of the economy measures listed in Vice Admiral Carney's report are: Recommended that shipyard repair and conversion work of War Department be done, as it has in the past, on a case basis. Recommended that Navy undertake the Army inspection work on two transport conversion jobs awarded Newport News Shipbuilding and Drydock Co.; and Navy to handle all Army overseas explosive shipments on the West Coast, saving $38,000 monthly; Joint Army-Navy weather bureau network for weather dissemination partially activated, all plans made to permit operation of 56 Navy stations, and a saving of $500,000 yearly expected when completely activated; Navy installation of necessary equipment for integration of continental naval air stations into the AAF military flight service communication system, an eventual saving of over $250,000 per year being expected upon completion of this project.

WATERWAYS, HARBORS, AND FLOOD CONTROL

By Raymond A. Wheeler
Lieutenant General, U. S. A.; Chief of Engineers, Department of the Army

RIVER AND HARBOR IMPROVEMENTS

Federal improvement and maintenance of rivers and harbors and other waterway channels of the United States and its territories and island possessions have been prosecuted for some 125 years under the direction of the Secretary of the Army and supervision of the Chief of Engineers, in accordance with the authorizations of Congress. During the fiscal year, which ended June 30, 1947, improvement operations were carried out on 91 regular river and harbor projects, of which four were completed. Maintenance operations were performed on 291 projects, including the numerous coastal and inland harbors, connecting channels on the Great Lakes, the extensive Intracoastal Waterway and Mississippi River network, together with the operation and care of the canalized Ohio River system, Illinois Waterway, the upper Mississippi River, and the hydroelectric power plants on the Columbia River at Bonneville, Ore., and on the Missouri River at Fort Peck, Mont. The Federal expenditures for new work and maintenance operations on navigation projects and allied operations during the fiscal year ended June 30, 1947 were $89,169,789.29.

The principal items of new work performed during the fiscal year 1947, other than on canals and inland waterways, included dredging of the westerly 600-foot strip of Ambrose Channel and the center 800 feet of Anchorage Channel in New York Harbor to a depth of 45 feet; dredging and rock removal and removal of wrecks and obstructions in New York and New Jersey Channels in Arthur Kill from above the Baltimore and Ohio Railroad bridge to Elizabethport to a depth of 37 feet was completed, and dredging and rock removal in the southerly half of the channel in Kill Van Kull from Bergen Point to Bayonne bridge to a depth of 37 feet was in progress at the end of the fiscal year. Deepening of the harbor at Lake Worth Inlet, Florida, was initiated in the 300-foot outer channel and in the inner channel to and including the turning basin. Construction of Dam B on the Neches River, Texas, was initiated on a portion of the earthen embankment. At Los Angeles and Long Beach Harbors, California, construction of the 13,350-foot detached breakwater was continued, and at Moss Landing Harbor, California, dredging of the entrance and inner channels and construction of the north and south timber jetties were completed.

In addition to the new work mentioned in the preceding paragraph, maintenance operations were performed at important river and harbor and other waterway projects previously completed along the Atlantic, Gulf, and Pacific coasts, in the interior, and on the Great Lakes. Work was also performed during the past fiscal year on 15 projects of a river and harbor nature required by the Department of the Navy and other government agencies with funds furnished by those agencies.

At Fort Peck Dam, Montana, on the Missouri River, the reservoir was operated throughout the fiscal year for the maintenance of navigation on the Missouri River, and incidental purposes of flood control and hydroelectric power production. Releases for these purposes also served the needs of water supply and stream sanitation along the Missouri River below the dam. Operation of the completed 35,000-kilowatt generating unit was continued during the major portion of the year, the total power production during the fiscal year 1947 being 204,347,000 kilowatt-hours. At Bonneville Dam, Oregon and Washington, the ten power-generating units were operated throughout the fiscal year, producing 3,711,155,000 kilowatt-hours.

INTRACOASTAL WATERWAYS

The Atlantic and the Gulf Intracoastal Waterways provide a protected channel for barge and other light-draft navigation following coastal sounds, bays, rivers, and artificial channels. This canal system, extending for some 2,500 miles along the Atlantic and Gulf coasts, affords a channel 12 feet or more in depth throughout the Atlantic coast section from Trenton, N. J., to Jacksonville, Fla., and in the Gulf coast section from Carrabelle, Fla., to Corpus Christi, Tex. During 1947, new work dredging was performed in the Gulf Intracoastal Waterway in Texas between Corpus Christi Bay and Baffin Bay.

The Cape Cod Canal, Massachusetts, extending from the head of Buzzards Bay to Cape Cod Bay, and the Chesapeake and Delaware Canal between the Delaware River and Chesapeake Bay, are sea-level waterways, affording a protected and shorter route for coastwise ocean-going vessel traffic and were maintained and operated as required.

New work bank stabilization at several sections on the Chesapeake and Delaware Canal was completed during the year.

INLAND WATERWAYS

The principal inland navigable waterways of the United States include the Mississippi River system, the New York State Barge Canal system, the San Joaquin-Sacramento River system in California, and the Columbia River system in the northwest. The Mississippi River Waterway system embraces the river proper, the Red, Arkansas, Missouri, Illinois, Ohio, Tennessee, Monongahela, Allegheny, and Kanawha rivers and other streams. The Mississippi River has a channel for ocean-going vessels to Baton Rouge, La. and thence a channel for modern barge navigation to Minneapolis, Minn. and in its principal tributaries. The Illinois River and Waterway to Lake Michigan has a barge channel which connects the Great Lakes with the Mississippi River system. The Mississippi River system, together with the Intracoastal system with which it connects at Plaquemine and New Orleans, La. brings barge navigation within reach of important industrial and farming centers.

The San Joaquin-Sacramento River system, with an outlet to the sea through San Francisco Bay, has a deep-draft channel to Stockton, Calif. on the San Joaquin River and a moderate-draft channel to Sacramento on the Sacramento River. The Columbia River affords a channel for ocean shipping to Portland, Ore., and Vancouver, Wash., and depths suitable for commercial-vessel traffic to the head of the pool formed by the Bonneville Dam, and thence depths for barge navigation upstream to and including the Snake River.

These systems of inland waterways were maintained and operated during the past fiscal year to provide for water-borne commerce and other traffic. The principal projects on which new construction was accomplished during the fiscal year included the lateral canal and lock project on the Mississippi River at Chain of Rocks, near St. Louis, Missouri. Work on this project was continued and comprised the relocation of utilities, bridge construction over the canal, and dredging the lower approach to the canal. Open-river regulating works on the Mississippi River between the Ohio and Missouri rivers consisted of 13 dikes and three revetments which were completed, and 12 dikes which were under construction at the end of the fiscal year. Construction of guide walls for the landward lock of lock and Dam No. 2 at Hastings, Minn. on the upper Mississippi River was substantially completed. On the Missouri River between the mouth and Sioux City, La., 14 dikes and 48 revetments were completed, and 10,073 linear feet of dikes, 19,627 linear feet of revetment and 3,603 linear feet of pile revetment were strengthened; in addition one dike and seven revetments were under construction at the end of the fiscal year. Channel straightening in the Illinois Waterway in the Starved Rock pool was continued. Construction was initiated during the fiscal year on the McNary Dam project on the Columbia River with excavation for the navigation lock, construction of access roads, railroad spur tracks and a siding.

GREAT LAKES

The Great Lakes (Superior, Michigan, Huron, Erie, and Ontario) have natural deep water except in the connecting channels which have been artificially deepened where necessary to accommodate deep-draft vessels. They have an outlet to the Atlantic Ocean *via* the St. Lawrence River and *via* the Oswego and Erie branches of the New York State Barge Canal system and the Hudson River.

Deepening a 250-foot wide channel in the westerly outer harbor at Oswego, N. Y. to project depths, and operations for the removal of rock shoals in the Black Rock Canal at Buffalo were in progress at the end of the fiscal year. Revetment construction at the upper entrance to Keweenaw Waterway, Michigan, was initiated during the year.

WATER-BORNE COMMERCE

The total net water-borne commerce of the United States, after eliminating all known duplications of traffic, aggregated 617,955,391 short tons in the calendar year 1946. A net total of 95,648,203 short tons was carried on the Mississippi River and its tributaries, and 175,888,343 short tons of traffic were moved on the Great Lakes.

NET TOTAL COMMERCE OF THE UNITED STATES

Year	Short Tons	Year	Short Tons
1935	453,331,000	1941	653,600,000
1936	525,842,000	1942	589,900,000
1937	583,100,000	1943	580,581,000
1938	466,900,000	1944	605,928,000
1939	569,400,000	1945	618,906,000
1940	607,900,000	1946	617,955,000

NET COMMERCE AT TEN LEADING COASTAL PORTS IN 1946

Buffalo	16,150,366

MISSISSIPPI FLOOD CONTROL

Works for improvement of the channel of the Mississippi River proper were continued during the fiscal year ended June 30, 1947 at various places below Cairo, Ill. and the levees built for flood control from Rock Island, Ill. to near Head of Passes, Louisiana, now extend from 484 miles above to 966 miles below Cairo at the confluence of the Mississippi and Ohio rivers. Below Cairo, revetment is in place over more than 100 miles of river bank, and many miles of permeable dikes are in place for bank stabilization and channel regulation. The 2,500-mile levee system was substantially completed and now contains nearly 1,200,000,000 cubic yards of earth. The contemplated Bonnet Carre spillway structure and the New Madrid Floodway have been successfully operated and are ready for future operation when required. The flood control dam on the St. Francis River and two in the

Yazoo River Basin have been completed and are in operation. Two more dams in the Yazoo Basin are under construction.

A navigable channel is available throughout the main river from Minneapolis to the Gulf of Mexico. Below Alton, Ill. the channel is maintained by open river works. In the 655 miles of river above Alton to Minneapolis, a system of low-head dams with locks provide a 9-foot channel depth adequate for modern barge navigation. The Ohio River and certain of its improved tributaries are also canalized to provide a 9-foot channel for barge navigation serving this highly industrialized region. The system of six locks and dams on the Ouachita and Black rivers provide depths of 6½ feet at low water, a distance of 351 miles, from the Red River to Camden, Ark. The Red River proper and the Arkansas River have been improved for light-draft navigation throughout a total length of more than 1,000 miles.

GENERAL FLOOD CONTROL

After having previously authorized specific projects for the alluvial valley of the Mississippi River and for the Sacramento River, California, Congress, in the Flood Control Act approved June 22, 1936, authorized the construction of flood-control projects and the investigation of flood problems on streams throughout the United States and its territorial possessions. The Federal program for general flood control was launched in 1937 when funds were first appropriated by Congress for that purpose. By the end of June 1947, 52 reservoirs and 153 local protection projects were in operation. In addition to previous authorizations, an Act of Congress, approved Aug. 4, 1947, authorized the construction of the project on the Little Sioux River in Iowa, at an estimated cost of $3,320,000. The total authorization to date provides $2,294,044,500 for the construction of approximately 761 projects dispersed throughout the United States. This amount does not include ten projects having an estimated cost of $161,675,500 which the 1946 Flood Control Act placed under the jurisdiction of the Mississippi River Commission. In the period from 1937 through July 31, 1947, Congress appropriated $1,081,494,725 for national flood control purposes, comprising $1,005,272,825 for construction and detailed planning of authorized projects and $76,221,900 for maintenance of completed projects, conducting surveys, and miscellaneous activities.

Taken collectively, all of the authorized projects constitute a plan, comprehensive and coordinated, for developing the nation's streams. The plan provides economical flood protection and allied benefits for centers of industry and population; millions of acres of rich, agricultural land; and vital lines of communication. In addition to their use for flood control, many of the reservoirs provide for multiple-purpose utilization such as hydroelectric power generation, stream-flow regulation, water conservation, recreation, and other water uses.

A number of projects were completed during the year. Pertinent data in regard to all of the projects completed or placed in operation to date, under the national flood-control program, are contained in the tables on pp. 374 to 376.

These projects have already returned large benefits in the prevention of flood damages. Work was continued during the year on those projects which had been placed under construction throughout the nation. While the previously scheduled program for river and harbor and flood-control improvements was drastically curtailed by a directive from higher authority, subsequent revision of the directive permitted a resumption of certain activities, particularly in connection with contracts in force. By the end of the fiscal year, construction had been initiated on practically all the new projects for which funds had been made available. Some typical examples of projects under way include local protection works at Williamsport, Pennsylvania, and the Almond Reservoir, New York, in the

Susquehanna River Basin; the Clark Hill Reservoir on the Savannah River and the Allatoona Reservoir in the Coosa River Basin, both in Georgia; the John Martin Reservoir, Colorado, Blue Mountain Reservoir, Arkansas, and the Canton Reservoir, Oklahoma, all in the Arkansas River Basin; the Clearwater Reservoir, Missouri, in the White River Basin; the Kanopolis Reservoir, Kansas, the local protection project at the Kansas Cities, Missouri and Kansas, the Garrison Reservoir, North Dakota, and the Fort Randall Reservoir, North Dakota and South Dakota, all in the Missouri River Basin; the Wolf Creek Reservoir, Kentucky, and the Cincinnati, Ohio, local protection project, in the Ohio River Basin; the Los Angeles River Channel improvement in California; and the Lookout Point Reservoir, Oregon, in the Willamette River Basin.

The separately authorized project for the Sacramento River and its

Youngs River Dikes, Clatsop County, Oregon

tributaries, California, will provide flood protection for cities and towns, fertile agricultural lands, and railway and highway facilities of great importance to the economy of the western United States. Work was continued on this project throughout the year, including levee construction along the tributaries of the Sacramento River.

FLOODS AND FLOOD DAMAGE

The 1947 floods were among the worst of record, particularly in the Missouri River Basin; some part of that stream being above flood stage almost continuously from late March to July. The floods would have been more severe had not cold weather in the upper Missouri Basin held the record snow cover in the mountains, and had not Fort Peck Reservoir captured large volumes of flood flows. An area of over 3,000,000 acres was inundated, resulting in direct flood damages estimated at over $100,000,000. The loss of 26 lives was reported and at least 195,000 persons were reported homeless. The Upper Mississippi River was also severely devastated. Damages were estimated at approximately $65,000,000; however, the total cost of the flood probably will never be known due to the difficulty of evaluating damages resulting from interruption of rail and highway traffic; disruption of public utilities, soil erosion, loss of wages and consequent reduction of buying power, loss of business which can not be recovered, sickness and accident directly attributable to the flood and many other intangible damages. Other floods of a less severe nature occurred throughout the country. Emergency flood-fighting, rescue work, and emergency repairs were conducted in accordance with the provisions of existing flood-control law.

PART FOUR

ECONOMICS AND BUSINESS

DIVISION X

BUSINESS AND FINANCE

ECONOMIC AND BUSINESS CONDITIONS

By S. S. Huebner
Professor, University of Pennsylvania

DOLLAR VALUE AND COMMODITY VOLUME IN BUSINESS

Despite great confusion occasioned by an unusual inflation spiral, 1947 presents a remarkable record of business in both commodity volume and dollar value. Nearly all of the leading business barometers show a gain over 1946, and where there were declines, the retrocession was only minor, but where gains happened to be expressed only in dollars, they must be interpreted in the light of the strong inflationary tendency of the year and the marked corresponding depreciation of the dollar as measured in terms of commodities. Thus, according to reports, gross national production approximated $235,000,000,000, compared with $204,000,000,000 in 1946; national income rose to $200,000,000,000, compared with $178,100,000,000 in 1946; while industrial production, according to the Federal Reserve Index, reached 192 in November, compared with 183 in November, 1946.

Viewing economic barometers as a whole, substantial increases occurred in most of the important lines of economic activity. New capital flotations for the first nine months of the year aggregated $2,681,000,000, compared with $1,990,000,000 for the corresponding period of 1946; while refunding issues for the first three-quarters of the year totaled only $1,267,000,000, compared with $2,635,000,000 for the same period of the previous year. Bank clearings for the nation as a whole, when compared with 1946, were greater by about 18.9 per cent, and for the nation, exclusive of New York City, by about 19.2 per cent. The steel industry operated during 1947 on an annual basis of about 85,000,000 ingot tons, compared with 74,000,000 tons in 1946. Oil production is estimated to reach 1,850,000,000 barrels (compared with 1,733,000,000 for 1946); electric output to 305,000,000,000 kwh. (compared with 270,000,000,000 for 1946); and bituminous coal production to 563,000,000 tons for the first 11 months of the year, an increase of 15.3 per cent over the same period of 1946. Railway freight traffic was reported at the end of 1947 to have reached 647,358,000,000 ton miles, compared with 591,954,000,000 in 1946. Construction work also reached a new peak in dollars, although somewhat less than for 1946 in physical volume, while new capital for construction purposes was 13 per cent above 1946. Exports for the first nine months of 1947 (latest available) totaled nearly $11,000,000,000, compared with $7,000,-

000,000 for the same period of 1946, while for imports the corresponding totals were $4,000,000,000 and $3,500,000,000. In the automotive industry tremendous improvement occurred, the year's output being estimated at 2,500,000 passenger cars and 900,000 trucks and buses, the highest civilian year in the industry's history with the exceptions of 1929 and 1937. For the first nine months, corporate dividends on common stock issues listed on the New York Stock Exchange exceeded those for the corresponding period of 1946 by 21.5 per cent. Retail sales for 1947 are estimated to reach $110,000,000,000, compared to $97,000,000,000 in 1946, although the unit volume is estimated to run about 10 per cent below 1946.

The only noteworthy barometric exceptions showing decreases for 1947 when compared with 1946 were "crop production," "business failures," and the "security market," but all these declines were relatively small. Owing to the corn crop failure, total crop production is estimated to be 5 per cent smaller than the record harvest of 1946, but only 1 per cent under the last five year average. From a monetary point of view, owing to the large rise in farm prices, the farmer has been in a most favored position. Farm income for 1947 is estimated to total about $18,000,000,000 as compared with $15,500,000,000 in 1946. Business failures for the first nine months of 1947, when compared with the same period for 1946, increased in number from 952 to 2,510, and in the liabilities involved from $29,500,000 to $158,000,000. These increases seem large but are not very significant, partly because comparison is made with the insignificant totals of 1946, and partly because even the larger figures for 1947 are still far removed from the much larger totals of prewar years.

STOCKS AND BONDS

Of all leading economic barometers, the 1947 stock market presents the most dismal picture. Here total transactions for the year amounted to only 254,000,000 shares on the New York Stock Exchange, compared with 364,000,000 shares during 1946, while on the New York Curb Exchange the 1947 and 1946 transactions totaled respectively 72,000,000 and 137,000,000 shares. Moreover, the market was fairly steady throughout the year, at a low price level, and with only a slightly bullish tendency. Comparing the December averages for 1946 with the October averages for 1947 (Standard and Poor's Index, latest available), the railroad group of stocks averaged 48.4 for December, 1946, as compared with 42.5 for October, 1947; for the industrial group, the respective averages were 145.3 and 151.4; for the public utility group, 79.5 and 74.5; for the copper group, 123.8 and 115.6; and for a combined average of the railroad, industrial and public utility groups, 120.2 and 122.7. The bond market likewise was much more inactive during 1947 than in 1946, and prices showed a drooping tendency. Apparently the violent bear market of 1946 had substantially discounted unfavorable post-war problems. Apparently also the bear market of 1946 had spent its force, while the 1947 security market could do little more than maintain its position at the bottom level reached in 1946.

AGRICULTURE

For 1947, total crop production was estimated to be 5 per cent less than the 1946 record-large harvest, but, compared with the average output during the five-year period 1942-1946, in all of which time harvests were unusually large, total crop production during 1947 was only 1 per cent below the average.

Considerable variation in various crops seemed to prevail. As contrasted with the cotton crop failure of 1946, the 1947 yield of 11,500,000 bales compares with 8,600,000 bales for 1946, or a gain of 33.7 per cent. The wheat crop of 1,407,000,000 bushels also compares favorably with 1,156,000,000 bushels for 1946, a gain of 21.7 per cent. Moreover, compared with 1946, the 1947 yield shows crop gains as follows: flaxseed 73.9 per cent, rye 35.8 per cent, barley 8 per cent, rice 7.7 per cent, beans 6.3 per cent, peanuts 4.4 per cent, and buckwheat 4.2 per cent.

Certain major crops showed losses during 1947, and unfortunately large losses in the three major crops of potatoes, oats, and corn. Tobacco production, as compared with 1946, showed a loss of 5.3 per cent, apples 5.8 per cent, sugarcane 8.3 per cent, and soybeans 9.8 per cent. Potatoes registered a total of only 380,000,000 bushels as compared with 476,000,000 bushels for 1946, or a decline of 20.2 per cent. Oats production totaled only 1,232,000,000 bushels as compared with 1,500,000,000 bushels in 1946, a decline of 18.4 per cent. Most unfortunate of all was the corn crop failure, the most essential crop from a national point of view. Here production was as low as 2,447,000,000 bushels, compared with 3,288,000,000 bushels for 1946, a decrease of 25.2 per cent.

Prices of leading farm products during 1947 showed very substantial increases along nearly all lines. Thus, using closing prices for agricultural commodities, quotations at the close of October, 1947 (*Guaranty Survey*, Oct. 30, 1947, and the Alexander Hamilton Institute's *Business Conditions Weekly* for Nov. 29, 1947) compare as follows with prices on the corresponding date in 1946: wheat, No. 2 red winter, Chicago, per bu., $3.06 as compared with $2.17; corn, No. 2 yellow, Chicago, per bu., $2.47 as compared with $1.90; rye, farm, per bu., $2.49 compared with $1.99; oats, May, Chicago, per bu., $1.16½ compared with $.69¾; cotton, New York, per lb., $.35⅞ as compared with $.31¼. The following additional prices may be mentioned (Alexander Hamilton Institute's *Business Conditions Weekly*, Nov. 29, 1947) by way of comparison with the same date for 1946: barley, Chicago, per bu., $1.80 as compared with $1.45; butter, New York, per lb., $.78 as compared with $.83; cheese, fresh, New York, per lb., $.45 as compared with $.49; eggs, farm, per doz., $.55¼ as compared with $.51½; flour, Minn., Pat., per cwt., $8.15 compared with $6.00; lard, Middle West, per lb., $.28¼ compared with $.31¾; cattle, live, Chicago, per cwt., $33.45 compared with $31.55; hogs, live, Chicago, per cwt., $25.36 compared with $23.21; lambs, live, Chicago, per cwt., $23.18 compared with $22.92; milk, per cwt., $4.64 compared with $4.42; potatoes, New York, per cwt., $2.62½ compared with $2.17½; and tobacco, av., per lb., $.41⅝ compared with $.53.

MANUFACTURING AND MINING INDUSTRIES

In these industries, price increases during 1947, as compared with 1946, were also very substantial. Comparing October 1947 with the corresponding quotations for 1946, the following price comparisons may be selected from those listed in the *Guaranty Survey* (Oct. 30, 1947): coffee, 27¢ per lb. compared with 21.69½¢; copper, 21.37½¢ per lb. compared with 14.25¢; hides, 33¾¢ per lb. compared with 15½¢; pig iron, $36.00 per gross ton compared with $28.00; steel billets, Pittsburgh, $45,00 per gross ton compared with $39.00; lead, 15.00¢ per lb. compared with 8.25¢; petroleum, Pennsylvania, $4.50 per bbl. compared with $3.41; rosin, $8.05 per cwt. compared with $7.82; rubber, 19½¢ per lb. compared with 22½¢; sugar, 6.32¢ per lb. compared with 5.57½¢; tin, 80.00¢ per lb. compared with 52.00¢; wool, Ohio fine delaine, $1.27 per lb. compared with $1.09; and zinc, 10.50¢ per lb. compared with 9.25¢.

NEW CORPORATE FINANCING

The total new capital financing for the first nine months of 1947 (latest available) aggregated $2,681,369,000 as compared with $1,990,000,000 for the corresponding period of 1946, and with $927,000,000 for the same period of 1945. The 1947 total of $2,681,000,000 also compares with $459,000,000 for the corresponding period of 1944, $200,000,000 for 1943, $614,000,000 for 1942, $770,000,000 for 1941, $458,000,000 for 1940, $311,000,000 for 1939,

CORPORATE FINANCING

	1946		1947	
	Capital	Refunding	Capital	Refunding
January	$131,170,000	$112,954,000	$252,109,000	$102,635,000
February	47,089,000	264,262,000	128,343,000	30,924,000
March	127,315,000	284,215,000	309,822,000	139,824,000
April	289,600,000	362,663,000	376,689,000	73,215,000
May	191,930,000	663,502,000	210,666,000	317,498,000
June	307,350,000	366,065,000	517,009,000	210,657,000
July	366,543,000	345,174,000	483,242,000	123,226,000
August	354,302,000	92,057,000	148,132,000	147,305,000
September	170,290,000	144,180,000	256,357,000	122,187,000
October	266,635,000	65,208,000		
November	589,878,000	86,316,000		
December	668,968,000	105,385,000		

Source: *Survey of Current Business*, November, 1947.

$316,000,000 for 1938, and $1,154,000,000 for 1937. It should also be noted that a considerable monthly fluctuation in new capital flotations took place during 1947. Thus, for February and August, the monthly totals reached less than $150,000,000, while, for June and July, the monthly totals reached $517,000,000 and $483,000,000, respectively.

The total of refunding issues for the first nine months of the year showed a decided decrease as compared with 1946, the total standing at $1,267,000,000 in contrast to the corresponding figure for the same period of 1946 of $2,635,000,000. The 1947 figure also compares, for the corresponding period, with $3,509,000,000 for 1945, $1,362,000,000 for 1944, $445,000,000 for 1943, and $296,000,000 for 1942. The 1947 figure may also be compared with the corresponding figures of $1,354,000,000 for 1941 and $1,252,000,000 for 1940. It should also be noted that the new capital totals for the first nine months of 1947 ($2,681,000,000) is considerably less than the total for all of 1946, namely, $3,515,000,000. By way of contrast, the refunding total for the first nine months of 1947 ($1,267,000,000) is less than half of the 1946 yearly total of $2,892,000,000.

YEARLY TOTALS

	Capital	Refunding
*1947	$2,681,369,000	*$1,267,571,000
1946	3,515,118,000	2,891,981,000
1945	1,255,405,000	4,911,361,000

BANK CLEARINGS

Bank clearings for 1947, owing largely to inflationary tendencies, rose considerably above those of 1946 and 1945. The grand total for the week ended Nov. 22 (*Commercial and Financial Chronicle*), for 112 cities, was $15,823,000,000 as compared with $13,309,000,000 for the corresponding week of 1946, an increase of 18.9 per cent. For the corresponding week of 1945 and 1944, the totals were $10,624,000,000 and $9,710,000.000, respectively. Exclusive of New York City, the nation's Federal Reserve Districts showed total bank clearings for the week ended Nov. 22 of $7,969,000,000, an increase of 19.2 per cent, as compared with the 1946 corresponding week's total of $6,683,000,000. The showing for 1947, exclusive of New York City, also compares with $4,720,000,000 and $4,446,000,000 for the corresponding week of 1945 and 1944, respectively. The respective gains and losses for each of the 12 Federal Reserve Districts, for the week ended Nov. 22, 1947, in comparison with 1946, are shown by the following table:

Federal Reserve District	1947 (millions)	1946 (millions)	Increase or Decrease %
First—Boston (12 cities)	634	555	+14.3
Second—New York (12 cities)	8,136	6,854	+18.7
Third—Philadelphia (11 cities)	1,121	927	+20.9
Fourth—Cleveland (7 cities)	941	773	+21.7
Fifth—Richmond (6 cities)	490	424	+15.6
Sixth—Atlanta (10 cities)	655	649	+ 0.8
Seventh—Chicago (17 cities)	1,060	890	+17.9
Eighth—St. Louis (4 cities)	608	500	+21.6
Ninth—Minneapolis (7 cities)	427	354	+20.7
Tenth—Kansas City (10 cities)	550	466	+18.1
Eleventh—Dallas (6 cities)	337	166	+102.6
Twelfth—San Francisco (10 cities)	865	740	+16.9
Grand Total (112 cities)	15,823	13,309	+18.9
Outside New York City	7,969	6,683	+19.2

SECURITY MARKETS

The 1947 security market was unusually inactive as well as steady in its price movements. Four main price trends occurred during the year, namely, (1) a slight appreciation during the first two months, (2) a bear market of moderate proportions during March to May, inclusive, (3) a small rise during June and July, and (4) a fluctuating market with nominal increases and declines during the balance of the year. Despite their very high price level, gilt edge bonds declined from the 1946 price level during the first nine months of 1947 by 1.8 per cent. The severest decline occurred in October from a September high average of 115.6 to an October high average of 114.4, or 1.2 points.

Combining the three leading groups of stocks (Standard and Poor's Index) —railroads, industrials, and public utilities—the October 1947 average price of 122.7, when compared with the January average of 120.8, shows an appreciation for the first ten months of the year of only 1.6 per cent. This compares with a depreciation of 18.1 per cent for the same period of 1946, and with an appreciation of 22.33 per cent for the same period of 1945. For the first ten months of 1947, the following price changes (comparing the October average with the January average) occurred in the four leading groups of stocks: railroad stocks with a decline from 46.8 to 42.5, or by 9.2 per cent; industrial stocks with an increase from 146.3 to 151.4, or by 3.5 per cent; public utilities with a decline from 79.7 to 74.5, or by 6.3 per cent; and coppers with a decline from 118.3 to 115.6, or by 2.3 per cent. The annual volume of transactions on the New York Stock Exchange was much less than during 1946, namely, 253,623,894 shares, as compared with 363,709,000 shares for 1946 and 377,564,000 shares for 1945. Million-share days were the exception, unlike the experience during 1946 and 1945. Transactions on the New York Curb Exchange were also much smaller than in 1946.

The 1947 stock market just about maintained an even level, speculative sentiment evidently regarding the 1946 bear market as having spent its force. Press accounts during recent months have been sufficiently optimistic to discard the possibility of a major depression, and yet current events seemed to inspire sufficient pessimism to prevent anything like a bull market. (See "The Security and Money Markets," p. 391.)

RAILROAD INDUSTRY

The year shows a somewhat larger railroad traffic than prevailed during 1946 and preceding five years, as described in previous issues of THE AMERICAN YEAR BOOK. According to the Association of American Railroads (announcement of Nov. 20, 1947), revenue freight car loadings during the first 45 weeks of 1947 showed an increase of 7.9 per cent over the same number of weeks during 1946, and an increase of 5.2 per cent in the similar period of 1945. Shipments of grain and grain products during the first 45 weeks of 1947 were larger by 12.2 per cent than for the same period of 1946; coal shipments by 10.7 per cent; coke shipments by 24.9 per cent; forest products by 7.6 per cent; and ore by 35.2 per cent. Decreases were shown in only two groups, namely, livestock shipments with a decrease of 15.7 per cent, and merchandise shipments with 3.2 per cent.

Earnings, though they show an increase, were not maintained as well as the volume of traffic. According to the Association of American Railroads, Class I railroads of the United States showed total operating revenues for the first nine months of 1947 of $6,328,000,000 as compared with $5,621,000,000 for the corresponding period of 1946. For the same period, total operating expenses were $4,959,000,000 as compared with $4,713,000,000 for 1946, the operating ratio per cent being 78.36 for 1947, compared with 83.83 for 1946. Taxes increased enormously, namely, to $687,000,000 as compared with $429,000,000 for 1946. Net railway operating income (before charges) was reported for the first nine months of 1947 as $558,000,000 compared with $367,000,000 for 1946, while net income (after charges) is estimated for the first three-quarters of 1947 at $316,000,000 compared with $105,000,000 for the same period of 1946. (See "Railroads," p. 557.)

COAL PRODUCTION

Despite labor troubles at the beginning of the year, production in this important industry exceeded the large output of 1946, which, as explained last year, was but slightly under the record output of 1945. According to the National Coal Association, bituminous production in 1947, for the first 11 months, totaled 563,055,000 tons, an increase of 74,801,000 tons over the same period of 1946, or by 15.3 per cent. With respect to anthracite production, however, the Anthracite Institute reported on Dec. 31 that the output for 1947 will approximate 54,170,000 net tons, 3,140,000 tons, or 5.5 per cent below 1946's production.

EXPORTS AND IMPORTS

Exports of merchandise for the first nine months of 1947 (latest available) totaled $10,826,000,000 as compared with $7,118,000,000 for the same period of 1946, and $7,975,000,000 for the corresponding 1945 period. The 1947 total compares with exports of merchandise for the first nine months of 1944 of $10,742,000,000, of $9,107,000,000 for the corresponding period of 1943, and with annual totals of $4,022,000,000 for 1940, $3,177,000,000 for 1939, $3,094,000,000 for 1938, $3,349,000,000 for 1937, and $5,241,000,000 for the record peace year of 1929.

Total imports during the first nine months of 1947 rose to $4,191,000,000 as compared with $3,519,000,000 and $3,172,000,000 for the corresponding period of 1946 and 1945. The 1947 total also compares with $2,923,000,000 for the corresponding period of 1944, with $2,449,000,000 for the same period of 1943, and with annual totals of $2,626,000,000 for 1940, $2,318,000,000 for 1939, $1,960,000,000 for 1938, $3,084,000,000 for 1937, and $4,399,000,000 for the record peace year of 1929.

The enormous difference between exports and imports during 1947, namely, $6,635,000,000, still reflects abnormal post-war conditions. As explained in previous years, this business barometer became badly warped by war conditions, and subsequently by post-war conditions which will wear off only in the course of time. A considerable portion of the huge difference is also attributable to the necessity of aiding foreign nations practically bankrupted by the war or rendered incapable of normal production efforts because of war ravages. Moreover, the inflation spiral in this country also raised greatly the dollar value of the large exports financed by the United States and sent abroad to prevent an economic collapse of impoverished countries.

AUTOMOTIVE INDUSTRY

Previous yearly accounts have described the almost complete operation of the industry in war production during the war period, the necessity for an almost complete reconversion to peacetime production, and the unfortunate slowing up of this reconversion during much of 1946 and 1947 by strikes and material bottlenecks, especially with respect to steel shortages.

Despite these difficulties, however, the industry made rapid headway during 1947. In its October issue, *Automobile Facts* reports that, during the first nine months of 1947, the automotive industry "produced more cars and trucks than were built in the entire twelve months of 1946"; that replacement parts production is running at double last year's output, which itself was a new high record, and that as a result "millions of cars that would otherwise be out of service are continuing to operate because their owners are able to get repair parts from motor plants"; that employment "has reached 789,000, or nearly 40% above pre-war levels, with weekly payrolls now totaling $44,000,000, or double the average of 1941"; and that "if production in the final three months of the year continues near the level of the previous quarter, 1947 will be the third highest civilian production year in the history of the industry, surpassed only by 1929 and 1937." The publication estimates the first nine months output for 1947 to exceed 2,500,000 passenger cars and better than 900,000 trucks and buses.

Many unusual procedures have been resorted to in order to overcome the lack of steel and thus make possible the aforementioned record. Some companies have made outright purchases of old steel rolling mills, in order to expand their steel-making facilities. Moreover, some segments of the industry are substituting aluminum for steel in making certain units, one company at the present time experimenting with aluminum for 43 parts now made of steel.

IRON AND STEEL OPERATIONS

Operations in this industry were exceedingly good during 1947. As explained by *The Iron Age* (Nov. 27):

"Despite raw material shortages and time consumed in repairing and rehabilitating equipment, steel ingot output in 1947 will be 34½ per cent greater than the previous peacetime peak in 1929, 61 per cent greater than the pre-war year of 1939 and about 30 per cent higher than the year 1940 when the United States was shipping large amounts of metal to the Allies.

"There is every indication that the total steel ingot output this year will amount to 85 million net tons, a figure only 5.1 per cent below the all-time high during the war year 1944 when steelmakers turned out 89.6 million tons of ingots. There is nothing in the picture now to prevent the 1947 record from being bettered in 1948."

According to the American Iron and Steel Institute, the week ended Nov. 30 showed the steel industry operating at 96.3 per cent of rated capacity, equivalent to 1,685,200 tons. This rate compares with 62.8 per cent or 1,106,800 tons for the corresponding week of 1946. The price of finished steel stood at 3.18925 cents per pound for the week of Nov. 18, 1947, compared with 2.70711 cents for the corresponding week of 1946. Pig iron (per gross ton) was quoted at $36.96 in 1947 (week of Nov. 18), compared with $28.13 in 1946 for the corresponding week. Scrap steel (per gross ton) was quoted at $41. 25 for the week of Nov.

18, compared with only $19.17 for the same week of 1946.

ELECTRIC OUTPUT

According to the Edison Electric Institute, the production of electricity by the electric light and power industry of the United States totaled 5,180,000,000 kwh. for the week ended Nov. 22, 1947. This output compares with 4,765,000,000 kwh. for the corresponding week of 1946, thus showing an increase of nearly 9.0 per cent. The output of 5,180,000,000 kwh. for the week ended Nov. 22, 1947, also compares with 4,097,000,000 kwh. for the week ended Dec. 7, 1945, 4,538,000,000 kwh. for the corresponding week of 1944, 4,560,000,000 kwh. for the week of Dec. 1, 1943, 3,884,000,000 kwh. for the corresponding week of 1942, 3,976,000,000 kwh. for 1941, 2,755,000,000 for 1940, and 1,415,000,000 for the depression year of 1932.

CONSTRUCTION WORK

Despite many difficulties by way of labor and materials, this important industry reached a new peak in building outlay. According to *Engineering News-Record,* the dollar volume of construction work to be recorded for 1947 will exceed any previous record, the estimated value of all types of building for the year, including heavy construction, exceeding $12,000,000,000. The previous record was set in 1942, with a total of $11,521,000,000. A peace-time record of $5,659,000,000 was recorded for heavy engineering work. Commercial buildings, including mass housing, rose slightly to $1,898,000,000, and highway work established a new peak of $794,000,000. New capital for construction purposes during 1947 is reported to total $3,886,000,000, or 13 per cent above the previous year.

Because of rising costs, however, the physical volume of construction work was less than in 1946. Costs in the field of heavy engineering work rose 17 per cent during 1947 as compared with 1946, whereas that year showed a rise of 18 per cent over 1945. Hourly wages in the building trades, it is reported, are 76 per cent higher than in 1940, while the average drop in output per man is 38 per cent.

COMMERCIAL FAILURES

The 1946 account explained that the failure record for the first nine months of that year showed an increase as compared with the exceedingly good record for the corresponding period of 1945, but not to any unusual degree. The number of business failures reported by Dun and Bradstreet for the first nine months of 1947 amounted to 2,510 as compared with only 762 for the same period of 1946, and with 646 for the same months of 1945. It also compares with 905 for the first nine months of 1944, and with 2,752, 7,641, 9,299, 10,398, and 11,197 for the corresponding nine months period of 1943, 1942, 1941, 1940, and 1939, respectively. The nine months record of 1947 (2,510) also compares with full yearly records of 12,836 for 1938, 9,490 for 1937, 9,607 for 1936, 12,244 for 1935, 12,091 for 1934, 19,859 for 1933, and 31,822 for 1932, the bottom year of the depression.

With respect to failure liabilities, 1947 also shows a considerable increase as compared with the remarkably good records of 1946 and 1945. For the first nine months of the year, total liabilities of failures amounted to $157,882,000 as compared with $34,333,000 for the corresponding period of 1946, with $24,189,000 for the same months of 1945, and, for the corresponding period, with $23,000,000, $37,000,000, $81,000,000, $106,000,000, $124,000,000, and $139,000,000 for 1944, 1943, 1942, 1941, 1940, and 1939. The 1947 nine-month record ($158,000,000) also compares with the following full yearly records of $30,000,000 for 1945, $32,000,000 for 1944, $45,000,000 for 1943, $101,000,000 for 1942, $136,000,000 for 1941, $167,000,000 for 1940, $168,000,000 for 1939, $247,000,00 for 1938, and $928,000,000 for 1932, the bottom year of the depression.

CORPORATE DIVIDENDS

According to the New York Stock Exchange's monthly magazine, *The*

Exchange, dividends of 954 separate common stocks listed on the New York Exchange (against 746 dividend payers in 1946), for the first nine months of 1947, exceeded those of the corresponding period of 1946 by 21.5 per cent. Two hundred and fifty-five paid the same dividend as in the preceding year, 496 increased their dividend distribution, 54 paid lower dividends, and 24 suspended or deferred dividends altogether. In the aggregate, the dividend disbursement of all the stocks for the nine months ended Sept. 30 amounted to $2,152,265,000 as compared with $1,771,371,000 during the corresponding period of 1946, and $1,555,577,000 in 1945.

The Stock Exchange's list contains 30 categories of stocks. Twenty-one of these categories showed exceptionally large gains, namely, "amusement," 29.7 per cent; "automotive," 32.1 per cent; "building," 46.4 per cent; "business and office equipment," 23.4 per cent; "chemical," 28.3 per cent; "farm machinery," 17 per cent; "food," 26.8 per cent; "garment manufacturers," 27.3 per cent; "leather and shoe manufacturers," 43.9 per cent; "machinery and metal products," 31.2 per cent; "mining," 51.4 per cent; "paper and publishing," 78.5 per cent; "petroleum," 28.3 per cent; "retail merchandising," 28.6 per cent; "rubber," 53 per cent; "ship operating," 64.1 per cent; "steel, iron and coke," 25.3 per cent; "textile," 111.3 per cent; "transportation services," 38.5 per cent; "United States companies operating abroad," 33.5 per cent; and "other companies," 68.2 per cent.

Three of the categories showed gains ranging from 7.3 per cent to 12.9 per cent, namely, "electrical equipment," 7.7 per cent; "utilities," 7.3 per cent; and "foreign companies," 12.9 per cent. Only five categories out of the 30 showed declines, namely, "air transportation," with a decline of 88.7 per cent; "aircraft manufacturers," with 67.3 per cent; "financial," with 1.6 per cent; "railroads," with 11.6 per cent; and "shipbuilding," with 22 per cent. Commenting on its detailed report, *The Exchange* (October, 1947) states:

"So far as dividend payments record the state of manufacturing and trade, the results of 1947's first three quarters in case of corporations with securities listed on the New York Stock Exchange indicate a pretty thorough rout of those prophets of 1946 who forecast a business reversal this year. The statistical exhibit accompanying this discussion shows not only that cash disbursements on listed common stocks increased considerably; the figures reveal, also, that some of the groups selected as targets for gloomy prognostications were liberal providers of stockholder income. Consumer goods, it will be recalled, were particularly tagged to go into a partial retreat. . . .

"More impressive than the percentage changes was the fact that nearly 85 per cent of Stock Exchange listed equities distributed dividends. An element counting in this high percentage was vested in a number of newly listed issues—added to the roster since September 30, 1946—which brought dividend records with them to the board. Of the 805 equities paying during the nine months, 61 per cent distributed more money than in the corresponding interval of last year. At the same time payments were reduced on 54 issues and eliminated or deferred on 24.

"The obverse side of the shield revealed that, although the general situation was cheerful for owners of common stocks, some important recessions occurred. Air transportation companies, involving 10, came within a shade of paying practically nothing; the airplane manufacturing category did better than the companion group but also dropped back. Railroads, too, while experiencing a high level of traffic recognized increased costs with an 11.6 per cent decline."

GENERAL BUSINESS CONDITIONS

Using the industrial production figures of the *Federal Reserve Bulletin* (adjusted for seasonal variation), it appears that the record for September 1947 (latest figures available), shows an increase as regards the majority of important lines of business as compared with 1946. Increases were shown in 10 leading types of industries, comparing September, 1947, with September, 1946, as follows: iron and steel with an increase from 185 to 195; machinery from 261 to 274; beehive coke from 352 to 427; meat packing from 38 to 146; newsprint consumption from 117 to 131; manufactured food products from 136 to 155; lubricating oil from 153 to 164; wheat flour from 135 to 137; petroleum crude from 149 to 163; and tobacco products from 157 to 163. Between the same dates, declines are recorded in seven leading industries, namely, transportation equipment from 240 for September, 1946, to 223 for September, 1947; plate glass from 161 to 151; non-ferrous metal and products from 172 to 168; textiles and products from 168 to 158; bituminous coal from 163 to 161; anthracite coal from 125 to 122; and silver from 58 to 51. Leather and products, it should be stated, maintained its position during the year, namely, at 119.

COMMODITY PRICE INDEX

Using the U. S. Department of Labor wholesale price index for main groups of commodities, 1947 experienced a substantial upward trend in the price level, namely, from 141.5 for January 1947, to 157.4 for September (latest available). The January index of 141.5 compares with 107.1 for January 1946, 104.9 for January 1945, 103.3 for January 1944, 101.9 for January 1943, 96 for January 1942, and 80.8 for January 1941. During the first nine months of 1947, this index represents a price increase of 11.3 per cent, and since January 1941, of 94.6 per cent. The September 1947 figure of 157.4 compares with total yearly averages of 120.9 for 1946, 105.8 for 1945, 104 for 1944, 103.2 for 1943, 98.8 for 1942, 87.3 for 1941, 78.6 for 1940, 77.1 for 1939, 78.6 for 1938, 86.3 for 1937, 64.9 for 1932 (the depression year), and 154.4 for 1920, the highest yearly average under this index since the beginning of the century. As already explained under the sections dealing with "Agriculture" and "Manufacturing and Mining Industries," price changes for leading commodities in these fields during 1947 were mostly upward to a substantial extent.

It is also interesting to note that the United Kingdom Board of Trade index shows a very substantial increase for 1947, namely, from 179.1 for January 1947, to 192.3 for September (latest available). The latter figure compares with 169.6 for January 1946, 167.2 for January 1945, 164 for January 1944, 162.1 for January 1943, 156.4 for January 1942, and 149.5 for January 1941. In tabular form, the index numbers of the Department of Labor and of the United Kingdom Board of Trade for leading groups of commodities at the close of the year, compared with former years, are as follows:

INDEX NUMBERS OF COMMODITY PRICES

	U. S. Dept. of Labor		U. K. Board of Trade	
	1946	1947	1946	1947
January	107.1	141.5	169.6	179.1
February	107.7	144.5	169.4	180.6

LABOR CONDITIONS

With respect to labor conditions, using September as the basis (latest date from the *Federal Reserve Bulletin*), 1947 employment shows only minor increases in most of the important lines as compared with the same month of 1946, most of the large increases having occurred in the previous year. For iron and steel, the increase (unadjusted for seasonal variations) extended from 152.7 to 159.4, machinery except electrical from 210.3 to 224.8, automobiles from 196.0, to 198.2, lumber and timber and basic products from 138.6 to 159.9, furniture and lumber products from 123.5 to 133.2, apparel and other finished products from 132.9 to 146.5, food products from 137.5 to 152.7, paper and allied products from 140 to 143.5, printing and publishing from 122.3 to 131.5, chemical and allied products from 184 to 194.2, products of petroleum and coal from 147.8 to 153.6, and "miscellaneous industries" from 176.9 to 178.5. For the total of durable goods (unadjusted for seasonal variation), the increase in employment from September 1946, to September 1947, extended from 173.1 to 178.6, and, when adjusted for seasonal variation, from 172.7 to 178.2. For the total of non-durable goods (unadjusted) the increase from September 1946, to September 1947, extended from 130.9 to 137.4, and, when adjusted, from 129.6 to 136. Of all the groups included in the *Federal Reserve Bulletin's* list, only eight showed decreases or no change during the year, from September to September (unadjusted), namely, electrical machinery with a decline from 217.3 to 216.6, transportation equipment except automotive from 286.8 to 251.2, non-ferrous metals from 179.5 to 172.6, stone, clay and glass products from 142.5 to 142.8, textile mill and fiber products from 105.2 to 104, leather products from 103.1 to 105.1, tobacco products from 93.5 to 92.8, and rubber products from 189.1 to 180.2.

With respect to payrolls, much larger changes were shown in nearly all of the leading industries, according to the payroll index of the *Federal Reserve Bulletin*. The leading increases from September 1946 to August 1947, are as follows (unadjusted for seasonal variation): iron and steel with an increase from 273.6 to 314.4, electrical machinery from 397.2 to 420.3, machinery except electrical from 376.2 to 426.7, automobiles from 330.3 to 340.1, lumber and timber and basic products from 285.2 to 387.3, furniture and lumber products from 254.4 to 293.3, stone, clay, and glass products from 267 to 299.7, apparel and other finished products from 283 to 303.2, leather products from 204.7 to 220.4, food products from 246.5 to 313.9, paper and allied products from 259.8 to 300.6, printing and publishing from 203.1 to 235.5, chemical and allied products from 329.1 to 383.6, products of petroleum and coal from 257.3 to 297.2, and "miscellaneous industries" from 339.3 to 347.5. For durable goods, taken as a whole, the payroll figure shows an increase (September 1946 to August 1947) from 323.3 to 357.2, and for non-durable goods from 258.1 to 288.4. Of all the groups included in the *Federal Reserve Bulletin's* list, both durable and non-durable, only five showed payroll decreases, or no substantial change, during the year from September 1946 to August 1947, namely, transportation equipment except automotive, with a decrease from 524.1 to 482.1, nonferrous metals from 331.8 to 332.9, textile mill and fiber products from 235.5 to 239.8, tobacco products from 196 to 203, and rubber products from 363.9 to 357. According to the latest available report of the *Federal Reserve Bulletin,* the 1947 showing for the leading types of industries, as regards both employment and payrolls, is as follows:

FACTORY EMPLOYMENT AND PAYROLLS

	Employment						Payrolls		
	Adjusted for Seasonal Variation			Unadjusted for Seasonal Variation			Unadjusted for Seasonal Variation		
	Sept. 1947	Sept. 1946	Sept. 1945	Sept. 1947	Sept. 1946	Sept. 1945	Aug. 1947	Sept. 1946	Sept. 1945

THE SECURITY AND MONEY MARKETS

By S. S. Huebner
Professor, University of Pennsylvania

SHARE TRENDS AND MOVEMENTS

Stock market* movements during 1947 indicated four main trends, namely, (1) a slight appreciation in the price level during the first two months, (2) a bear market of moderate proportions during March and May inclusive, (3) a rise of moderate proportions during June and July, and (4) a vacillating market with moderate rises and declines during the balance of the year. As a whole, the year's market may be described as having been comparatively inactive, non-sensational as to price movements, and slightly bearish when compared with the closing price level of 1946.

The average monthly price level for the leading groups of stocks, at the end of the first ten months of the year (latest available), showed a slight depreciation of 1.6 per cent as contrasted with a decline of 18.1 per cent during the same period of 1946. For the four leading groups of stocks, the price level change for the first ten months of the year, comparing the January and October monthly averages, amounted to a decline of 9.2 per cent for railroad stocks, an increase of 3.5 per cent for industrials, a decline of 6.5 per cent for public utilities, and a decline of 2.3 per cent for the copper group. The total volume of transactions on the New York Stock Exchange reached only the 254,000,000-share figure, as compared with 364,000,000 shares for 1946, while transactions on the Curb Market (72,000,000 shares) were also much smaller than those for 1946. Million-share days on the New York Stock Exchange were the exception, and only three months of the first ten months of the year showed daily averages in excess of 1,000,000 shares, while for the month of August the daily average was as low as 674,000 shares.

Using a combined average for the leading groups of stocks, namely, railroads, industrials, and public utilities (Standard and Poor's index), the 1947 market was characterized by three minor trends with only slight variations throughout the year. These three price trends of the year may be indicated as follows: (1) a slight rise from January to February with monthly averages increasing from 120.8 to 125.5, an increase of 3.9 per cent; (2) a decline from March to May, inclusive, namely, from 125.5 (February average) to 113.9 (May average), a decrease of 9.2 per cent; and (3) a fluctuation back and forth from June to October, namely, a rise to 125.2 for July, or to the previous February level, and thereafter a slight decline to 122.7 for October.

BOND PRICE TRENDS

Bonds, using the Standard and Poor's index for corporate bonds, maintained for the first ten months of 1947 an unusually high price level, although slightly under the level for 1946, the January, 1947, high average being 116.7 and the October average 114.4. During October, however, this average declined considerably from 116.2 (August) to 114.4 (October), a decline of 1.8 points. Comparing January of 1947 with October of 1947, bonds show an average price depreciation of approximately 2 per cent, as compared with a depreciation of 3.3 per cent for the corresponding period of 1946.

SECURITY MARKET FACTORS

During 1947, post-war problems became increasingly apparent to the speculative community and were evaluated with a greater degree of certainty than was the case during 1946 and 1945. The more settled condition of the year's market is probably attributable to this factor. Moreover, the unfavorable nature of present problems was probably substantially discounted by the violent bear market of 1946.

At the beginning of 1947 prospective corporate earnings seemed uncertain because of the huge wave of bitter strikes in the nation's leading industries, but as the year progressed most of the basic industries, with the exception of railroads, managed to make a fairly satisfactory adjustment, and corporate earnings and dividend declarations remained remarkably satisfactory. In this adjustment, corporations were aided by price increases in their products with little buyer's resistance. In other instances, like the railroads and public utilities, price increases were authorized by government agencies, although, it is generally felt, not to an extent commensurate with the increased wage level. As a whole, the necessary readjustment was spotty in different fields, and the rate of adjustment generally was much slower than had been anticipated. Moreover, all through the year the inflation spiral was feverish and ever reaching new heights, with labor constantly seeking, through wage increases, to catch up to the ever increasing cost of living. As a result, the speculative community was largely motivated by inflation thinking, and apparently not inclined to give the market a rising trend. Apparently the bear market of 1946 had spent its force, but the 1947 market could do little more than maintain a *status quo*. The speculative community seemed to feel that a high postwar boom was unlikely to materialize, yet it also seemed to feel that the backlog of needed goods, repairs, and construction is so large as to make a serious business depression also unlikely.

At the time of this writing, current press accounts are stressing the following factors as influencing speculative thinking: (1) the large volume of business despite unsettled conditions, and the virtual absence of unemployment; (2) the unsettled character of the commodity markets, with their high price level continually subject to wild price fluctuations; (3) the rising inventories of retailers, and the apparent growth of buyer's resistance movements; (4) the speed of the inflation spiral, with its adverse effect upon the thinking of buyers, labor, and governmental bodies; (5) the constant threat by the Government of reinstituting governmental controls of one kind or another to stop the inflation spiral in certain basic commodities; (6) the continued high taxation, with little prospect for reduction, and the inability to reduce materially the huge national debt; (7) the first signs of a stiffening of long term money rates, already reflected in a drooping of the price level of preferred stocks and bonds; and (8) adverse developments in the foreign situation, so alarming as to necessitate the calling of a special session of Congress to combat starvation abroad and inflation at home. In view of all of these uncertainties, it is not at all strange that the 1947 stock market gave evidence throughout the year of its inability to recover any substantial part of the major market price decline of 1946.

INDUSTRIAL SHARE PRICES

The three-fold trend of the 1947 stock market is indicated by the monthly stock averages of the Standard and Poor's barometric index for various leading groups of stocks. Fifty representative industrial stocks had an average price of 146.3 for January, as compared with an average of 145.3 for December, 1946, and 172.8 for January of 1946. Thereafter the succeeding month showed a minor increase, the average for February being 152.5. Following February, a decrease occurred during March, April, and May, namely, to 146.8, 141.7, and 139.7, the latter figure being 8.4 per cent below the February average. Following May, an increase again took place to 154.2 for July. Thereafter the market fluctuated back and forth slightly, the August, September, and October averages being 150.9, 147.0, and 151.4, respectively. The October average of 151.4, when compared with the January average of 146.3, shows a slight increase in the average monthly price level of about 3.5 per cent. The October average of 151.4 compares with 142.9 for October, 1946, 159.7 for October, 1945, 127.1 for October, 1944, 117.3 for October, 1943, and with reference to approximately the same period (November) 95.2 for 1942; 93.8 for 1941; 106.9 for 1940; 123.0 for 1939; 129.1 for 1938; 107.8 for 1937; 168 for January, 1937, and 53.5 for the yearly average of 1932, the bottom year of the 1930-36 depression. The 1947 increase in this group of 3.5 per cent for the first ten months compares with a decline for the same period of 1946 of 17.3 per cent, and with a rise for the same period of 1945 of slightly over 21.1 per cent. It is interesting to note that the October, 1947 average of 151.4 is nearly three times the 1932 depression yearly average of 53.5.

RAILROAD SHARES

With respect to 20 representative railroad stocks, the monthly price average of the Standard and Poor's barometric figures shows about the same trends already explained for the industrial list. For January 1947, the monthly average stood at 46.8. Thereafter the monthly average rose to 48.7 for February and then declined to 44.6 for March, to 41.3 for April, and to 38.8 for May, a decline of 20.3 per cent as compared with the February average. By July, the monthly average had again increased to 44.5, or approximately to the March average of 44.6. Following July, the price level fluctuated back and forth, the monthly averages for August, September, and October being 43, 41.7, and 42.5, respectively. The October average of 42.5, when compared with the January average of 46.8, shows a decline of 9.2 per cent. It compares with 45.1 for October, 1946; 59 for October 1945; 42.1 for October 1944; 37.5 for October 1943; 29.7 for October 1942; 27.8 for November 1941; 30.1 for November 1940; 35.5 for November 1939; 31.7 for November 1938; 33.1 for November 1937; 47 for January 1936; and with yearly averages of 36 for 1935; 42.9 for 1934; 39 for 1933; and 26.8 for the bottom depression year of 1932. It is interesting to compare the October 1947 average of 42.5 with the 1932 low June monthly average of 15.

PUBLIC UTILITIES

For the public utility group, the 1947 average price movement reflects the same trends shown by the other major groups of shares. According to the Standard and Poor's index for 20 representative public utility stocks, the monthly average rose from 79.7 for January to 80.9 for February. During the following months the averages stood at 77.6 for March, 74.7 for April, 72.5 for May, and 73.1 for June. Following June, the price fluctuation was small and slightly declining, the July, August, September, and October averages being 76.2, 75.8, 74.5, and 74.5, respectively. The October average of 74.5, when compared with the January average of 79.7, shows a decline in the utility price level of 6.3 per cent. The October 1947, average of 74.5 compares with 74.3 for October of 1946, with 77.3 for the corresponding month of 1945; 55.9 for 1944; 51 for 1943; 33.7 for 1942; 37.9 for November 1941; 59.8 for November 1940; 69.5 for November 1939; 66.4 for November 1938; 63.3 for November 1937; 100.9 for January 1937; 88.4 for January 1936; and with yearly averages of 62.8 for 1935, 66.5 for 1934, 81.8 for 1933, and 88.7 for 1932.

COPPER SHARES

For a representative list of seven copper stocks, the average monthly price level for 1947 again shows trends similar to those already noted for the industrial, railroad, and public utility groups. From January to February the average rose from 118.3 to 121. Thereafter a decline occurred to 118.8 for March, to 114.1 for April, to 109.7 for May, and to 108.1 for June. Following June, the price fluctuated back and forth, but only slightly, namely, to 115.3 for July, 114.4 for August, 113 for September, and 115.6 for October. The October average of 115.6, when compared with the January average of 118.3, shows a depreciation in this group of 2.3 per cent. The year's October average of 115.6 compares with 109.7 for October 1946, with 110.6 for October 1945, and with October averages of 82.8 for 1944, 77.4 for 1943, 80.9 for 1942, and 83.4 for 1941.

Combining the stocks used by the Standard and Poor's index for industrials, railroads, and public utilities, the average monthly 1947 price level rose from 120.8 for January to 125.5 for February (3.8 per cent appreciation), then declined to 120.4 for March, to 116 for April, and to 113.9 for May. Thereafter a rise occurred, namely, to 117.9 for June and 125.2 for July. During the next three months the price level fluctuated slightly, namely, to 122.7 for August, 119.6 for September, and 122.7 for October. The October average of 122.7, when compared with the January average of 120.8, shows an appreciation for the first ten months of the year of 1.5 per cent. This compares with a depreciation of 18.1 per cent for the same period of 1946, and with an appreciation of 22.3 per cent for the same period of 1945. It should also be pointed out that the 1947 October average of 122.7 compares with 117.2 for the corresponding month of 1946, and with 131 and 102.5 for the same months of 1945 and 1944.

* Copper figures use 1935–1939 as a base period. All other figures use 1926 as a base period. The above figures are an average for the month based on daily closing prices, except for Copper, which are weekly closing prices.

(Source of data—Standard & Poor's *Trade and Securities, Current Statistics.*)

MARKET VALUE OF SHARES

Using the figures of the New York Stock Exchange, the total value of 1,879,000,000 of listed shares on that Exchange stood at $68,884,000,000 at the beginning of November 1947. This value compares with $66,115,000,000 at the beginning of November 1946; $69,561,000,000 at the same date in 1945; $53,087,000,000 in 1944; $45,101,000,000 at the close of November 1943; and $37,374,000,000 at the close of November 1942. The year's Nov. 1 value of $68,884,000,000 may also be compared with $37,882,000,000 on Dec. 1, 1941; $41,848,000,000 at the same date in 1940; $45,500,000,000 in 1939; $46,081,000,000 in 1938; $40,716,000,000 in 1937; and with $62,618,000,000 for March of 1937, the high mark before the bear market of 1937-38 began its course.

MONTHLY STOCK AVERAGES

The average monthly All Stock Price Index as compiled by the New York Stock Exchange, stood at 78.7 for Nov. 1, 1947, as compared with 79.3 for November 1946, and for the corresponding date, 80.2 for 1945, 69.7 for 1944, 59.8 for 1943, 50.6 for 1942, 51.6 for 1941, 57 for 1940, 63.2 for 1939, and 64.1 for 1938. The Nov. 1, 1947, average of 78.7 compares with the following Dec. 1 averages for preceding years: 37.8 for 1937, 56.01 for 1936, 45.85 for 1935, 35.59 for 1934, 32.78 for 1933, and 25.61 for 1932.

VOLUME OF STOCK TRANSACTIONS

Stock transactions on the New York Stock Exchange during 1947 were much smaller than during 1946, namely, 253,623,894 shares as compared with 363,709,000 shares for 1946, 377,564,000 shares for 1945, 263,074,000 shares for 1944, and 278,742,000 shares for 1943. During 1947, only January, February, July, and October showed total transactions above the 23,000,000 share mark per month. Every other month during the first ten months of the year showed a monthly total under 21,000,000 shares. June, August, and September record such small totals as 17,483,000, 14,153,000, and 16,017,000 shares, respectively. With the exception of February, July, and October, when the daily average of transactions (excluding Saturdays) was 1,132,000, 1,158,000, and 1,223,000 shares, respectively, the daily average for every other month from January to October was under and in nearly all cases considerably under the million share total. The 1947 total of 253,624,000 shares compares with 363,709,000 shares for 1946; 377,564,000 shares for 1945; 263,074,000 shares for 1944; 278,742,000 shares for 1943; 125,678,000 shares for 1942; 170,534,000 shares for 1941; 207,605,000 shares for 1940; and 1,125,000,000 for 1929, the highest figure on record.

1933	654,874,210	1947	253,623,894

On the New York Curb market sales of shares during 1947 totaled only 72,380,000, as compared with 137,220,000 shares for 1946, 143,337,000 shares for 1945, 71,062,000 shares for 1944, and 71,382,000 shares for 1943. The year's total of 72,380,000 shares also compares with 22,328,000 for 1942, 34,691,000 for 1941, 43,000,000 for 1940, and 474,000,000 for 1925, the largest on record.

THE BOND MARKET

Bond sales on the New York Stock Exchange during 1947 indicated a comparatively dull market, the total being only $1,075,541,000, as compared with $1,364,000,000 for 1946; $2,262,000,000 for 1945; $2,695,000,000 for 1944; $3,255,000,000 for 1943; $2,313,000,000 for 1942; $2,114,000,000 for 1941; and $1,672,000,000 for 1940.

During 1947, bonds maintained an unusually high price level throughout the year, although the price trend was substantially downward. Using Moody's Bond Prices as a basis (*Commercial and Financial Chronicle*, Nov. 27, 1947), the average for domestic corporation bonds stood at 112.19 on Nov. 25, 1947, as compared with 116.41 a year before, thus showing a decline of 4.22 points for the year. For corporate bonds of the Aaa group the average price for Nov. 25, 1947, was 117 and for the corresponding date of 1946 121.04. For the Aa group, the two average prices were 115.04 and 119; for the A group 112.37 and 116.02; and for the Baa group 105 and 109.79. For United States government bonds, the Nov. 25, 1947 price stood at 101.89, while a year before the price was 103.5. For the railroad group, according to the Moody classification, the Nov. 25, 1947 average price stood at 107.09, compared with 112 for the corresponding date of 1946; for the public utility group the corresponding prices were 113.89 and 117.6; and for the industrial group 115.63 and 119.01.

The extraordinarily high price of bonds brought the average bond yields to very low figures, although some improvement was shown over the low yields of 1946. According to Moody's Bond Yield Average, the average yield for all domestic corporation bonds was down to 3.05 per cent on Nov. 25, 1947, as compared with a yield of 2.83 per cent for the corresponding date of 1946. The yield for the Aaa, Aa, A and Baa groups was respectively 2.80, 2.90, 3.04, and 3.45 per cent, as compared with 2.60, 2.70, 2.85, and 3.18 per cent a year before. The yield on government bonds on Nov. 25, 1947 was 2.37 per cent as compared with 2.27 per cent on the same date in 1946. For the railroad group, the average yield was 3.33 per cent on Nov. 25, 1947, compared with 3.06 per cent a year previously, while for the public utilities group and the industrial group the average yields in 1947 (Nov. 25) were 2.96 per cent and 2.87 per cent, respectively, compared with 2.77 per cent and 2.67 per cent for the corresponding date of 1946.

Using the Standard and Poor's barometric averages for a representative group of corporate bonds, the monthly high average stood at 116.7 for January 1947. Thereafter the price fluctuated slightly from month to month, the high average standing at 117.1 for February, 117 for March, 116.9 for April, 116.3 for May, 114.7 for June, 116.1 for July, 116.2 for August, 115.6 for September, and 114.4 for October. The October average of 114.4 shows a decline of 2.3 points from the January 1947, average of 116.7, and a decline of 5.8 points, or 4.8 per cent, from the January 1946, average of 120.2. It should also be noted from the accompanying table that the monthly fluctuation between high and low was relatively small for the first nine months of the year. May was the only month which showed a range between high and low of as much as 3 points.

COMPOSITE BOND PRICES FOR 1947

	High	Low
January	116.7	115.8
February	117.1	116.5
March	117.0	116.2
April	116.9	116.2
May	116.3	113.6
June	114.7	113.9
July	116.1	114.6
August	116.2	116.0
September	115.6	114.5
October	114.4	113.3
November		
December		

All bonds listed on the New York Stock Exchange (888 issues) showed a total market value of $138,336,000,000 at the beginning of November 1947. This compares with $140,245,000,000 at the corresponding date in 1946; $128,741,000,000 in 1945; and with $102,000,000,000 on Nov. 1, 1944; $91,000,000,000 on Dec. 1, 1943; $64,500,000,000 on Dec. 1, 1942; $55,000,000,000 in 1941; and $51,000,000,000 in 1940. The substantial increase in 1943-1947 figures, it should be explained, is largely attributable to the issue and continued maintenance of large amounts of United States government securities during those years. On Nov. 1, 1947, the average price of the aforementioned listed bonds stood at 101.19, which compares with 102.46 at the corresponding date of 1946, 103.16 in 1945, 100.71 in 1944, and with 99.02 in 1943, 96.11 in 1942, 94.80 in 1941, 93.58 in 1940, 91.24 in 1939, 90.34 in 1938, and 81.36 in the bottom depression year of 1932.

THE MONEY MARKET

With respect to both time and call loan rates, the 1947 tendencies for the first nine months represent a slight stiffening of money rates as compared with 1946 and the preceding 12 years. As was the case during previous years, in fact as far back as 1933, New York time and call loan rates were quoted at only 1 per cent or slightly higher. Beginning with a January average of 1 per cent for four to six months prime commercial paper, and 1.38 per cent for call loans in New York, the average monthly rate remained fixed at these low figures for the first eight months of the year. During September, however, time rates rose to an average of 1.06 per cent, whereas call loan rates remained unchanged at 1.38 per cent for all of the first three-quarters of the year. The September average for time money of 1.06 per cent compares with 1 per cent for December 1946, and with 0.75 per cent for January, 1946. The September 1947 call loan average of 1.38 per cent compares with the same rate for the last four months of 1946 and with 1 per cent for January of that year.

According to the New York Stock Exchange's figures (Nov. 1, 1947), the borrowings of New York Stock Exchange members on collateral security continued to show a very small volume. The total of $333,000,000 for Nov. 1, 1947, compares with $371,000,000 for the corresponding date of 1946; with $911,000,000 for 1945; $878,000,000 for 1944; $718,000,000 for 1943; $342,000,000 for 1942; $436,000,000 for 1941; $362,000,000 for 1940; and $4,017,000,000 for 1929.

BANKING AFFAIRS

By Robert W. Bachelor

American Bankers Association

GENERAL

The year 1947 was a year of rising prices and inflationary pressures. Many factors contributed to these rising prices. Among inflationary forces were the foreign aid program, a cycle of wage increases in excess of increases in either the cost of living or productivity, a short corn crop, veterans' bonuses and relief benefits, agricultural price subsidies, housing subsidies, and United States Government spending at the rate of $37,000,000,000 a year. A large supply of liquid assets, as a result of financing the war, remained in the hands of the public.

Businesses have required more working capital to meet higher costs, to pay higher wages, and to finance more costly inventories. Borrowing from banks was one method of obtaining needed funds, and bank loans advanced substantially. Loans to commerce, industry, agriculture, and consumers were larger at the end of 1947 than at the beginning of the year. Total credit extended and total deposits increased only moderately, since banks sold United States Government securities as they expanded their loan portfolios.

DEPOSITS AND LOANS

Total deposits and currency outside the banks increased about $3,000,000,000 in 1947, due almost entirely to an expansion of time deposits. United States Government deposits were reduced, and demand deposits owned by individuals and businesses increased, by somewhat less than $3,000,000,000, making a total increase of about $5,500,000,000 in deposits and currency owned by individuals and businesses.

Deposits of individuals and businesses also increased slightly, due to additions to the monetary gold stock, totaling $2,250,000,000, offset in part by increased inventories of Treasury cash of nearly $1,000,000,000, and larger deposits of the United States Treasury with the Federal Reserve banks. The Federal Reserve System reduced its holdings of United States Government securities in an attempt to keep member bank reserve balances from increasing too rapidly.

Surveys of deposit ownership indicate that the command over demand deposits has been shifting from businesses to individuals. This has made it necessary for businesses to seek additional funds in the capital markets and from banks.

Banks expanded their loans by $7,000,000,000, and their investments in state and local government securities by $1,000,000,000, which increase nearly equaled their reduction of $9,000,000,000 in United States Government securities. More than $2,000,000,000 of gold was added to the monetary system and helped to increase bank deposits and bank reserves. Banks decreased loans for the purpose of purchasing and carrying United States securities by more than $1,000,000,000. Loans on real estate, and commercial, industrial, and agricultural loans increased, and there was some expansion in installment loans to consumers.

BANK EARNINGS AND CAPITAL

Earnings of banks that are members of the Federal Reserve System aggregated $350,000,000, after taxes, for the first half of 1947. This represented a decrease of 18 per cent from the corresponding period of 1946. Only one-third of total gross earnings was derived from United States Government securities in the first half of 1947, compared with almost one-half during the first half of 1946. Earnings were at the annual rate of 8.5 per cent of total capital funds. Two-thirds of earnings were retained by the banks to strengthen their capital position.

Capital accounts of member banks were increased nearly $500,000,000 in 1947, and on June 30, 1947 equaled 7 per cent of total deposits, compared with 6 per cent for the corresponding date of 1946. A substantial amount of new capital was invested in the banking business in 1946 and 1947. These were the first years since the early 1930's in which there was a substantial investment of funds not derived from earnings.

INTEREST RATES

The year 1947 was one of gradually rising interest rates on nearly all classes of loans. In July the Federal Reserve System allowed interest rates on Treasury bills to rise from the pegged rate of ⅜ to ¾ per cent. In subsequent months, the market rate advanced to nearly one per cent per annum on these three-months' securities. Rates on longer-term issues also were permitted to advance within a range of ⅛ to ¼ per cent.

The yield on Treasury bonds of 15 years or more to maturity reached a low of nearly 2 per cent in early 1946, but recovered and fluctuated around 2¼ per cent during most of 1947. In November, these long-term issues averaged to yield about 2⅜ per cent. On Dec. 24, after completion of the Treasury's current refunding operations, the support price was lowered to slightly above par for medium and long-term, fully taxable Treasury bonds. It was made clear that, whereas previously the Reserve System had been a reluctant buyer, it would now buy Treasury bonds aggressively at the new price level, in such amounts as might be necessary to clear the markets. Large purchases were necessary. In the period Dec. 26-30 inclusive, the Federal Reserve banks increased their holdings of Treasury bonds by $970,000,000. Commercial banks closed the year with substantial excess reserves due to sales of these securities.

Rates charged customers of city banks were advanced on several classes of collateral and banks became less willing to make term loans of long maturity. These increases in rates were notice to the business community that credit would be harder to obtain than in the immediate past. The Federal Reserve banks can maintain any rate they may choose on United States Government securities. Such rate can be supported by purchasing all securities offered at the posted prices. Continuation of support adds to the money supply of individuals and businesses, and adds to bank reserves. When the money supply expands until inflationary dangers threaten, then low money rates must be revised and higher yields (lower prices) must be offered on securities.

Rates paid by banks on savings accounts were advanced by many banks to encourage thrift and to supply the capital so much needed for industrial and municipal improvements.

GUARANTEES OF LOANS

The Reconstruction Finance Corporation abandoned its blanket participation agreement for the guarantee of bank loans, as of Jan. 22, 1947. They continued to guarantee up to 75 per cent of total loans of $100,000 or less, upon specific application for each loan.

Authority for the Federal Reserve banks to guarantee loans to business was sought by the Board, on the premise that banks were not taking care of the credit requirements of business. At the same time the Board requested additional powers to restrain the further expansion of bank credit. The authority requested was not granted by the Congress.

The Federal Housing Administration received authority to increase the amount of 90 per cent loans on new houses outstanding under Title VI of the National Housing Act, by $750,000,000. The program of guarantees of housing loans of all types, especially the type of loans referred to above, and the 100 per cent loans under the Veterans Administration program, has been severely criticized by the Chairman of the Board of Governors of the Federal Reserve System. Organized banking has strongly opposed government guarantees of any type of loans.

RATION BANKING

The ration banking program, in operation since January 1943, was terminated effective July 1, 1947. Banks opened accounts in and received deposits of ration coupons and certificates. Ration depositors drew ration checks in favor of suppliers of rationed goods. The end of rationing made these accounts unnecessary.

CONSUMER INSTALLMENT CREDIT

Installment credit controls exercised by the Board of Governors of the Federal Reserve System under Regulation W lapsed at the end of October, in accordance with a directive from the Congress, approved Aug. 8, 1947. The installment terms in general required down payments of one-third of the purchase price and maturities of not more than 15 months.

Upon expiration of the regulation, the American Bankers Association suggested to lenders that terms be limited to 33⅓ per cent down and 24 months on new automobiles; 25 per cent down with 18 monthly payments on radios and television sets; and 20 per cent down and 36 months to pay on refrigerators, ranges, washing machines, etc. Nearly all banks adhered to these terms.

During November and December, the Federal Reserve authorities attempted to obtain permanent statutory authority to reimpose Regulation W, but bills introduced into the Congress for that purpose were not enacted.

MARGIN REQUIREMENTS FOR PURCHASING SECURITIES

Effective Feb. 1, 1947, margin requirements for purchasing registered securities, were reduced to 75 per cent, applicable to purchases and to short sales. These transactions had been on a cash basis since Jan. 21, 1946. The amount of loans outstanding, for the purpose of purchasing and carrying both registered securities and United States Government securities, was very small throughout 1947.

DEPOSIT INSURANCE

Assets of the Federal Deposit Insurance Corporation—almost entirely in the form of cash and United States Government securities—at the beginning of 1947 were well in excess of $1,000,000,000. Assessments on insured banks in 1947 exceeded $100,000,000, making a total contribution by the banks of $750,000,000. About $200,000,000 was received from interest in investments held by the corporation during the years since organization in late 1933. During the entire period 1933-1947, deposit insurance losses and administrative expenses combined were less than $100,000,000. More than half of this was for administrative expenses. The original capital of the Corporation consisted of $139,299,557, contributed by the 12 Federal Reserve banks and $150,000,000 of United States Treasury funds.

Early in 1947, the American Bankers Association expressed the opinion that a deposit insurance reserve of $1,000,000,000 was large enough to meet any prospective need for funds, and advocated that assessment and other income received should be used to retire the capital contributions of the Treasury and Federal Reserve banks. Legislation authorizing the corporation to pay into the Treasury sums available without decreasing capital and surplus below $1,000,000,000 was approved Aug. 5, 1947, and, on Sept. 9, the corporation paid to the Treasury $146,695,250. This retired all capital stock held by the Federal Reserve banks, and retired part of the Treasury investment, a step toward making the fund a mutual insurance pool for banks, under government management. The new legislation authorized the corporation to borrow not to exceed $3,000,000,000 from the Treasury, if required for insurance purposes, and increased the salary of the directors of the corporation.

The Federal Reserve banks had replaced their subscription to stock of the Federal Deposit Insurance Corporation by earnings in years subsequent to 1933, when they were relieved of the obligation to pay a franchise tax. On April 24, the Board of Governors announced that it had levied a tax on the notes of the 12 Federal Reserve banks not collateraled by gold certificates, at such rate as to absorb 90 per cent of the net earnings after dividends of each Federal Reserve bank in 1947.

COOPERATIVE ACTION TO RESTRAIN EXPANSION OF CREDIT

Throughout 1947, banks were kept informed by the American Bankers Association of the rising trends in prices of farm land and urban real estate. Banks were advised to scrutinize loans in these classes with care.

On Nov. 25, the Board of Governors of the Federal Reserve System, the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the Executive Committee of the National Association of Supervisors of State Banks joined in a statement to bankers that "present conditions require the bankers of the country to exercise extreme caution in their lending policies. It is at times such as these that bad loans are made and future losses become inevitable."

In December, the American Bankers Association inaugurated a series of meetings on a nationwide basis, stressing the following principles:

That in the months immediately ahead, commodity and inventory loans which are designed to withhold essential goods from the normal market channels in anticipation of price rises should not be made.

That mortgage loans for non-essential building or for construction which can be postponed until building supplies and labor are in greater abundance should be discouraged.

That banks should give priority to loans to those borrowers who can turn out the supplies and services needed at home and abroad *now,* in order that the machinery for the production of essential goods may be kept functioning at maximum levels.

That there should be a greatly intensified drive to sell Treasury Savings Bonds to the public and to promote other forms of savings, such as savings accounts in banks, as a means of absorbing some of the surplus money in the spending stream which would otherwise continue to compete for the goods and services in short supply.

SPECIAL RESERVE PLAN

The Board of Governors of the Federal Reserve System, in late November, requested authority from the Congress for the Open Market Committee of the System to impose, for a period of three years, on all banks that receive demand deposits, a special reserve in addition to cash reserves now required by Federal or state bank laws.

This additional reserve could amount to as much as 25 per cent of gross demand deposits and 10 per cent of time deposits, in addition to present cash reserves of 6 per cent against all time deposits, and 20 per cent against net demand deposits of city banks, and 14 per cent for country banks. The special reserve could consist of obligations of the United States in the form of Treasury bills, certificates, and notes with original maturities of two years or less. It also could include coin and currency in vault, cash items in the process of collection, balances due from banks in excess of balances due to banks in the United States, and deposits with Federal Reserve banks, to the extent that the aggregate of these items exceeded 20 per cent of gross demand deposits.

If the maximum special reserve percentages of 25 per cent of gross demand deposits and 10 per cent of time deposits were imposed, banks as a group would have to sell long-term securities and buy short-term obligations from the Federal Reserve banks. Some banks would have to call loans and buy securities. As a result, banks would be less free to expand deposits by making loans and purchasing investments, since a substantial part of their government security holdings would be frozen as a required reserve. Banks that served their communities best by making loans, would be penalized most. Another effect would be that the market and rates for short-term United States Government securities would be divorced from the market for private loans and investments. Rates on short-term United States Government obligations could then be reduced to any level, even to zero. This could result in the ultimate freezing of the Federal debt (and any existing inflation of credit) into the banking system on an interest-free basis.

It is a most unwise policy to limit the possible expansion of production and distribution where financial assistance is needed. The supply of goods and services is thereby curtailed. The problem for an economically mature section of the United States is very different from that of an expanding economy. Imposing rigid rules is dangerous. It tends to stifle progress. The prospect of substitution of bureaucratic rules in place of the judgments of boards of directors of 14,500 banks in thousands of communities in the United States is alarming, to say

SUMMARY OF ASSETS AND LIABILITIES OF OPERATING BANKS IN THE UNITED STATES AND POSSESSIONS, JUNE 30, 1947

[1] Uninvested trust funds.
[2] Includes 12 banks for which asset and liability data are not available.

the least. Local bankers know the needs of their communities and of their borrowers. They know the ability of debtors to repay.

The special reserve requirement would extend Federal control over bank reserves (and the composition of bank assets) to state-chartered banks that receive demand deposits but are not members of the Federal Reserve System. It would be applied to uninsured banks, as well as banks whose deposits are insured by the Federal Deposit Insurance Corporation. This would be the first serious encroachment upon the dual system of banking in the United States.

AMERICAN BANKERS ASSOCIATION

The American Bankers Association held its 1947 convention in Atlantic City, N. J., in late September and early October. Much attention was given to the international situation. Officers of the Association elected for the year 1947-48 were: President, Joseph M. Dodge, president, The Detroit Bank, Detroit, Mich.; Vice-president, Evans Woollen, Jr., president, Fletcher Trust Company, Indianapolis, Ind.; Treasurer, Frank P. Powers, president, Kanabec State Bank, Mora, Minn.; and Executive Manager, Harold Stonier, New York.

TRUST BUSINESS

By GILBERT T. STEPHENSON

THE GRADUATE SCHOOL OF BANKING, AMERICAN BANKERS ASSOCIATION

TRUST DIVISION, AMERICAN BANKERS ASSOCIATION

The 1947-1948 organization of the Trust Division of the American Bankers Association is as follows: President, R. M. Alton, vice president in charge of trust department, United States National Bank, Portland, Ore.; Vice President, H. M. Bardt, vice president and trust officer, Bank of America N.T. & S.A., San Francisco, Calif.; Chairman of the Executive Committee, John W. Remington, vice president and trust officer, Lincoln Rochester Trust Company, Rochester, N. Y.; Secretary, Merle E. Selecman, deputy manager, American Bankers Association; Members of the Executive Committee: James W. Allison, vice president, Equitable Trust Company, Wilmington, Del.; Evans Woollen Jr., president, Fletcher Trust Company, Indianapolis, Ind.; John H. Evans, president, McDowell National Bank, Sharon, Pa.; N. Baxter Maddox, vice president and trust officer, The First National Bank, Atlanta, Ga.; Leo A. Steinhardt, president, International Trust Company, Denver, Col.; B. Magruder Wingfield, vice president, The National Bank of Commerce, Houston, Tex.; Clarence R. Chaney, vice chairman of the board, Northwestern National Bank, Minneapolis, Minn.; Edwin W. Marvin, vice president, The Hartford-Connecticut Trust Company, Hartford, Conn.; L. L. McArthur Jr., vice president, The Northern Trust Company, Chicago, Ill.; James M. Trenary, vice president and secretary, United States Trust Company of New York; Raymond H. Trott, president, Rhode Island Hospital Trust Company, Providence, R. I.; Richard P. Chapman, vice president, Merchants National Bank, Boston, Mass.; Thoburn Mills, vice president, National City Bank, Cleveland, O.; Frank H. Schmidt, executive vice president, California Trust Company, Los Angeles, Calif.; W. J. Thomas, vice president, Detroit Trust Company, Detroit, Mich.; Joseph W. White, vice president, Mercantile-Commerce Bank and Trust Co., St. Louis, Mo.

TRUST CONFERENCES

During 1947, one nationwide and two regional trust conferences were conducted, as follows: annual Mid-Winter Trust Conference in New York, Feb. 3-5; the Pacific Coast and Rocky Mountain States Regional Trust Conference in San Francisco, Oct. 22-24; and the Mid-Continent Trust Conference in Chicago, Nov. 6-7.

TRUST DIVISION ANNIVERSARY

In February 1947, in connection with the Mid-Winter Trust Conference, the Trust Division celebrated its fiftieth anniversary. Organized in St. Louis in 1896, it had its first annual meeting in Detroit in 1897. In celebration of this anniversary, Evens Woollen Jr., President of the Division, spoke on "The Trustman's Environment—Fifty Years Ago and Now"; Gilbert T. Stephenson, Director, Trust Research Department, The Graduate School of Banking, on "Fifty Years of Trust Business"; Austin W. Scott, Professor of Law, Law School of Harvard University, on "Fifty Years of Trust Law"; and William A. Irwin, Economist, American Bankers Association, on "Fifty Years of Economic Change."

TRUST LEGISLATION

Because in most states the legislatures were in session during 1947, the year was marked by the adoption of a large volume of trust legislation.

Common trust fund enabling acts

were adopted in Arkansas, California, Colorado, and Texas, making a total of 31 states with such acts.

The prudent-man rule for trust investment was adopted in Nevada, Oregon, and Washington, making a total of 20 states now operating under this rule either by statute or by judicial decision.

Nominee registration statutes, permitting corporate fiduciaries to register securities in the name of a nominee, were adopted in Arkansas, Connecticut, Indiana, Nebraska, and Washington, making a total of 26 states which have adopted this legislation.

Section 3 of the Uniform Fiduciaries Act was amended in Arkansas, California, Indiana, Maine, and Washington. By this amendment, nominee registration into as well as out of the name of the fiduciary is permitted; whereas, heretofore, only nominee registration out of the name of the fiduciary was permissible without imposing upon the fiduciary the duty of supervising the transfer. This amendment should greatly facilitate the transfer of listed securities in estates and trusts.

The Uniform Acts on Intestate Arbitration and on Compromise of Death Taxes where Domicile is in Dispute were adopted in Connecticut and Vermont, making a total of three states having the act on arbitration and 14 on compromise.

The Uniform Simultaneous Death Act was adopted in Kansas, Missouri, Nebraska, North Carolina, Oregon, and Rhode Island, making a total of 32 states with this act.

The Uniform Veterans Guardianship Act (1942 revision) was adopted in Rhode Island, making a total of 14 states with this act.

The Release of Powers of Appointment Act was adopted in Delaware and Oregon, bringing the total of states with this act up to 23.

The Uniform Stock Transfer Act was adopted in Iowa, Kansas, and Vermont. This completes the adoption of this act by every state.

Acts referred to as Uniform Acts are those which have been approved by the National Conference of Commissioners on Uniform State Laws.

COMMON TRUST FUNDS

As pointed out above, common trust funds enabling acts or decisions now exist in 31 states, four of which were added in 1947, but what is of more practical importance, at the end of the year there were 56 common trust funds in operation in 19 states and, in addition to these, there were eight commingled funds, designed to serve a purpose similar to that of common trust funds, in five states.

A complete list of the common trust funds, together with the year of establishment of the funds, is as follows:

Alabama: The First National Bank of Birmingham (1947); The First National Bank of Montgomery (1946).

California: Bank of America N.T. & S.A. (1947).

Connecticut: The First National Bank and Trust Company, Bridgeport (2 funds, 1943 and 1945); The First National Bank and Trust Company of New Haven (1946); Phoenix State Bank and Trust Company, Hartford (1946).

Delaware: Equitable Trust Company, Wilmington (2 funds, 1930 and 1934); Security Trust Company, Wilmington (1941); Wilmington Trust Company, Wilmington (1941).

Illinois: City National Bank and Trust Company of Chicago (1947).

Georgia: The Trust Company of Georgia, Atlanta (1943).

Maryland: Equitable Trust Company, Baltimore (1945); Safe Deposit and Trust Company, Baltimore (1945).

Massachusetts: Boston Safe Deposit and Trust Company, Boston (1945); The First National Bank of Boston (Fund A, 1947); Old Colony Trust Company, Boston (1945).

Minnesota: First Trust Company of St. Paul (2 funds, 1933 and 1937); Northwestern National Bank of Minneapolis (1946).

Missouri: Mississippi Valley Trust Company, St. Louis (1942); St. Louis Union Trust Company, St. Louis (2 funds, 1941 and 1941); Security National Bank Savings and Trust Company, St. Louis (1939).

New Jersey: Burlington County Trust Company, Moorestown (1945); Trenton Banking Company, Trenton (1945).

New York: Bank of New York, New York (1945); Central Hanover Bank and Trust Company, New York (1945); Continental Bank and Trust Company, New York (2 funds, 1944 and 1944); Marine Midland Trust Company, New York (1944); Security Trust Company, Rochester (1945).

North Carolina: Wachovia Bank and Trust Company, Winston-Salem (1941).

Ohio: Central Trust Company, Cincinnati (1945); Cleveland Trust Company, Cleveland (1945).

Pennsylvania: Union Trust Company, Butler ($1,200 fund, 1941); Norristown-Penn Trust Company, Norristown ($1,200 fund, 1939); Fidelity-Philadelphia Trust Company, Philadelphia (1940); Girard Trust Company, Philadelphia (2 funds, 1939 and 1939); Land Title Bank and Trust Company, Philadelphia (1942); The Pennsylvania Company for Banking and Trusts (2 funds, 1940 and 1940), Philadelphia; Provident Trust Company, Philadelphia (1940); Real Estate Trust Company, Philadelphia (1947); Tradesmen's National Bank and Trust Company, Philadelphia (1945); Mellon National Bank and Trust Company, Pittsburgh (2 funds, 1 a $1,200 fund; 1944); Peoples First National Bank and Trust Company, Pittsburgh (1940); Scranton-Lackawanna Trust Company, Scranton (2 funds, 1940 and 1946).

Virginia: National Bank of Commerce, Norfolk (1947).

Washington: National Bank of Commerce, Seattle (1947).

West Virginia: Flat Top National Bank, Bluefield ($1,200 fund, 1939).

Wisconsin: Marine National Exchange Bank, Milwaukee (1944).

In addition to these there are commingled funds which, though technically not common trust funds, serve the same general purpose, as follows:

California: First National Trust and Savings Bank, San Diego (1942).

Delaware: Equitable Trust Company, Wilmington (1930).

Michigan: Ann Arbor Trust Company, Ann Arbor (1933).

New York: Brooklyn Trust Company, New York (1929); City Bank Farmers Trust Company, New York (1930).

Vermont: Montpelier Savings Bank and Trust Company, Montpelier (1935); Proctor Trust Company, Proctor (1932); Waterbury Savings Bank and Trust Company, Waterbury (1941).

SIGNIFICANCE OF THE COMMON TRUST FUND

From the point of view of the general public and particularly of the creators and beneficiaries of trusts, the practical significance of the common trust fund is that it enables the beneficiaries of small trusts which participate in the fund to enjoy all the advantages of diversification and of administrative economies that the beneficiaries of a large trust enjoy. In a word, the common trust fund makes trust service available to persons of modest means and their beneficiaries and thereby greatly enlarges the range of service of corporate fiduciaries.

FOREIGN EXCHANGE

By Marcus Nadler
Graduate School of Business Administration, New York University

REVALUATION OF CURRENCIES

The year 1947 was marked by the revaluation of the currencies of several countries, notably Italy, Rumania, and the Soviet Union. Foreign exchange control remained in effect in most countries while the stability of exchanges that prevailed was frequently more nominal than real since fluctuations in the black markets were considerable. On Nov. 27, 1947 the Italian lira was officially depreciated from 350 lire to 589 lire to the dollar. A much more drastic currency reform was carried out in Rumania.

On Aug. 15, 1947, Rumania decreed an exchange of the leu into a new leu at the rate of 20,000 old lei = 1 new leu. The external rate of the new leu was fixed at 150 lei = $1.00. The amount of currency to be exchanged was limited, however, according to the occupation of the owner, ranging from 1,500,000 old lei for persons classified as without profession to 3,000,000 old lei for public and private employees and between 5,000,000 and 7,000,000 for heads of agricultural families. Currency and bank balances over the amounts subject to exchange were blocked in non-interest-bearing accounts.

Toward the end of the year the Russian Government also carried out a currency reform. New currency was created and the old ruble was converted into the new one at the rate of 10 to 1. More favorable rates (ranging from 1 for 1 to 1 for 5) were given to holders of savings deposits and government bonds.

CURRENCIES AND THE MARSHALL PLAN

Expected currency reforms in other countries did not take place. This was owing partly to the unsettled political conditions prevailing throughout the world, but primarily to the belief that the Marshall Plan would be adopted by the United States Congress and that, with American aid, currency stabilization would be easier to effect. In fact, one of the prerequisites of the Marshall Plan is the stabilization of European currencies. It has been widely realized that so long as the supply of money and deposits in most countries of Europe is far greater than the supply of commodities available for sale, there will be little incentive to work, and no real rehabilitation of the economies can take place. It may therefore be expected that, with the adoption of the Marshall Plan, major currency reforms will be carried out in many parts of western Europe.

GOLD MOVEMENTS

Throughout 1947 the United States witnessed a considerable inflow of the yellow metal. During the first 11 months of 1947, imports of gold to the United States, together with gold released from earmark, amounted to $2,700,000,000. This huge movement of gold to this country is not surprising. It is primarily the result of the great shortage of dollars which prevails throughout the world. The scarcity of dollars, in turn, reflects the acute shortage of commodities all over the world and the fact that the United States is the only major country in a position to supply agricultural as well as manufactured goods. Toward the end of the year the Canadian Government was working on plans to increase the output of gold by granting subsidies to the gold mines. At the same time, the United States was contemplating measures to sterilize the inflow of gold and to prevent it from creating new reserve balances as well as new deposits. The fact that some countries are paying subsidies to increase the output of gold while the United States Government is forced to take measures to sterilize gold is perhaps the best indication of the unstable international financial situation prevailing throughout the world.

INFLATION ABROAD

Despite the fact that currencies in many countries nominally remained stable, the process of inflation continued unabated in most countries of the world. Commodity prices are rising and are kept down only by price controls and rationing still in force in many parts of the world, especially Europe. The acceleration of inflation is only partly owing to the shortage of goods. To a large extent, it is due also to the over-supply of money caused in part by the deficits of the governments. In order to meet their expenditures, ordinary as well as extraordinary, many governments throughout the world are forced to have recourse to the central banks, thus leading to an increase in the volume of currency in circulation as well as to an expansion of bank deposits. In some countries, such as China, this situation has reached a point where the currency has practically lost its value as an international currency and as a medium of exchange at home. It is quite evident that a stabilization of such currencies can not take place until budgets are balanced and measures have been taken by the respective governments to reduce materially the great supply of the means of payment.

Serious inflationary conditions also exist in the occupied countries. In Germany, where, although nominally the purchasing power of the reichsmark has remained practically unchanged as far as rationed commodities are concerned, the currency unit of the Reich has lost its value as a means of payment or as a medium of exchange. Commodity prices in the black market are much higher than those on rationed commodities, and most transactions are carried out through barter. Similar conditions prevail in Japan and in Korea.

THE 1948 OUTLOOK FOR CURRENCY REFORM

In all probability the year 1948 will be a decisive one in currency reform throughout the world. While it is not as yet clear what form the Marshall Plan will ultimately assume, it is already evident that some type of assistance will be granted by the United States to the western European countries. This, in turn, is bound to be accompanied by important currency reforms designed to restore confidence in the currencies of these countries at home and to give them a sound international position. The principal country where drastic currency reform may be carried out is France.

These reforms will entail not merely the balancing of budgets but also a sharp reduction in the amount of currency in circulation and in bank deposits as well as an increase in production and exports. The reforms will be materially aided by the assistance to be extended by the United States which, on the one hand, will reduce the dollar shortage and, on the other, will place substantial sums in local currency at the disposal of each individual government. It is expected that the commodities which will be shipped by the United States to the various countries receiving aid under the Marshall Plan will be sold by the governments to the population for local currency. These currencies will be set aside and earmarked for the account of either the respective government or the United States Government. This measure is bound to lead to a reduction in the volume of currency in circulation.

Whether the adoption of the Marshall Plan will lead to the termination of the inflow of gold to the United States is highly doubtful. It may, however, bring to a halt the exportation of gold at present held by governments and central banks as part of their monetary reserves. It certainly should not bring to an end the inflow of newly mined gold, primarily because no other nation in the world is rich enough under present conditions to buy this gold. What the world at large wants and needs is not the yellow metal but commodities with which to feed the populations and to restore their economies.

THE POUND STERLING

The most serious problems in the field of international exchange are those relating to the pound sterling and to the Canadian dollar. The fact that Bank of England notes are selling at between $2.50 and $3.00 has often been interpreted to mean that the pound is greatly overvalued at the official rate of $4.03 and that a downward readjustment is bound to take place in the not distant future. The discount on pound-sterling notes is owing primarily to the fact that the export and import of this currency are restricted by law and that individuals may bring into the country and take out only five pounds. The rate is no indication of the actual purchasing power of the pound sterling nor does it reflect any future actions that may be taken by the British Government. Whether the pound sterling is overvalued or undervalued is impossible to state because conditions in Great Britain are entirely different from those prevailing in the United States. Subsidies still play an important role in Great Britain, and price control and rationing embrace a large volume of commodities.

An analysis of conditions in Great Britain leads to the conclusion that no change in the sterling rate is likely to take place in the immediate future. Fiscal conditions in Great Britain, on the whole, are sound. The budget is balanced, and the creation of new deposits through Treasury borrowing has come to an end. Foreign exchange restrictions are likely to remain in force for an indefinite period, giving the government almost complete control over the types and quantities of commodities to be imported. A decline in the international value of the pound would not increase exports from Great Britain since the failure to develop exports more rapidly is not due to the fact that British commodities can not compete in the world markets but rather to the shortage of commodities available for export. Depreciation of the pound would not, therefore, lead to an increase in exports which, in the existing sellers' market, are limited by production rather than by the price structure. Second, since Great Britain must import in large quantities from outside the sterling area many indispensable commodities, notably raw materials and foodstuffs, devaluation of the pound would result in an increase in prices of these commodities expressed in terms of the pound sterling. This would automatically lead to an increase in the cost of living followed by demands for higher wages, thus setting in motion the spiral between prices and wages. Within a relatively short time, therefore, the advantages, if any, that might be gained from a devaluation of the pound would be lost. It is, consequently, not to the interest of the British economy to decrease the international value of the pound.

Third, any change in the international value of the pound sterling would be bound to have far-reaching repercussions in the entire sterling area. The currencies of the member countries have remained stable in relation to the pound. A readjustment in the pound, therefore, could not be made without first taking into account its effects on the members of the sterling area. The sterling bloc has performed a very useful function in permitting the free conversion of the various currencies into one another and into the pound sterling, thus facilitating trade and capital movements among the member countries. Devaluation would affect adversely the sterling-area members holding large sterling balances in London. Finally, a further devaluation of the pound would deal a serious blow to the prestige of London as an international financial center.

A devaluation of the pound sterling might be expected only under the following conditions:

1. A decrease in prices of food and

raw materials not accompanied by a corresponding decline in prices of manufactured goods. In that case, a devaluation of the pound sterling would stimulate exports of British commodities to countries whose national income was reduced as a result of the decline in prices of raw materials and foodstuffs. If the pound sterling were to remain unchanged under those conditions, it would become more difficult for agricultural and raw materials producing countries to buy in Great Britain. Since the British economy depends to a large extent on exports, this obviously would not be to the interest of Great Britain.

2. Devaluation would be feasible if, in the future when the sellers' market is replaced by a buyers' market, British industry should find it difficult to compete with the more efficient industries of the United States. Under those circumstances a devaluation of the pound, if not accompanied by an increase in wages and prices in Great Britain, would render British commodities more competitive in the world's markets.

3. Finally, the future movement of the pound sterling will depend to a large extent upon the movement of commodity prices in the United States. If prices in this country remain high and even continue to go higher, then the pound sterling may be undervalued and certainly no further devaluation will be needed. If, on the other hand, prices in the United States should decrease materially, then a change in the international value of the pound might be made for competitive reasons.

THE CANADIAN DOLLAR

The fact that the free rate of the Canadian dollar is quoted at a discount of between 9 and 10 per cent below the official rate has led to the belief that a devaluation of the Canadian dollar is imminent. This does not necessarily follow.

It should be noted that Canada has only one exchange rate applying to Canadian residents, namely, the official rate, which is at par with the American dollar. The free rate operates only abroad, primarily in the United States, and can be used only under the conditions indicated below.

1. Transactions in the free market are invariably between non-residents of Canada. Residents of Canada may not purchase or sell foreign exchange in the unofficial market.

2. Under Canadian foreign-exchange regulations, United States dollars and other foreign exchange are made available to residents of Canada at official rates out of official Canadian reserves to meet payments on all current account transactions with non-residents, such as payment for imports and services, including interest and dividends. In addition, certain capital payments may also be made by residents of Canada to non-residents in United States dollars or other foreign exchange at official rates to pay off maturing debts, including bond issues payable in United States funds or other foreign currencies.

3. Residents of Canada are required to obtain foreign exchange for exports and sell such funds to a bank in Canada or otherwise account for them to the Foreign Exchange Control Board, except for occasional exports involving not more than $100 in Canadian funds. Similarly, United States dollars and foreign exchange received for services, except professional services and services rendered to tourists, must be sold at official rates to a bank in Canada. Income on and proceeds from sale of foreign securities must also be accounted for to the Foreign Exchange Control Board.

4. The foreign exchange regulations permit capital payments to non-residents in Canadian dollars which may not be converted into foreign funds. The supply of "inconvertible" Canadian dollars consists basically of bank balances held by non-residents of Canada when foreign exchange control was instituted in September 1939. These balances can be transferred freely between one non-resident and another in the unofficial market.

Other supplies of inconvertible Canadian dollars are derived mostly from sales by non-residents (Americans) of various types of capital assets in Canada. For example, Americans have bought Canadian securities for cash since 1940 and registered such purchases at the time of purchase with the Foreign Exchange Control Board. Holders of these securities are authorized to sell them in Canada and to transfer the proceeds in Canadian dollar funds to other Americans. Similarly, Americans have been authorized to sell real estate and receive the proceeds in inconvertible Canadian dollars. Finally, proceeds from maturing securities payable solely in Canadian dollars may be transferred to non-residents in inconvertible funds.

5. The demand for inconvertible Canadian funds arises when foreigners, mostly Americans, wish to buy Canadian securities or real estate, or make loans or investments in Canada, or travel in Canada.

Since the inconvertible Canadian dollar funds may be used only for limited purposes, they sell at a discount which represents the inducement offered by one non-resident to another to take over a capital investment in Canada which can not be converted into United States funds through official channels at the official rate. The volume of transactions in this market is rather small when contrasted with the total amount of Canada's international transactions. Thus, the exchange value of inconvertible Canadian funds is determined in a narrow and highly specialized market, and, therefore, the prevailing discount can not be taken as an indication that the official rate will be reduced.

Another reason often advanced for the possibility that the Canadian dollar may soon be devalued is the fact that Canada is encountering a serious shortage of United States dollars. During the first seven months of 1947, merchandise exports from Canada to the United States amounted to $564,300,000, whereas imports from this country amounted to $1,151,300,000, thus leaving a trade deficit of $587,000,000. In contrast, the total foreign trade of Canada, exclusive of gold exports and re-exports, showed for the same period an excess of exports over imports of $92,800,000. However, the largest export surplus is with Great Britain, and since the pound sterling can not be freely converted into dollars this has placed a serious exchange burden on Canada. It has been argued that a devaluation of the Canadian dollar might alleviate the dollar shortage. It can not, of course, be denied that a devaluation of the Canadian dollar in terms of American currency would make American commodities more expensive and, therefore, might curtail imports, particularly of commodities considered as unessential. Also, it would make Canadian commodities cheaper in terms of American dollars, and this in turn would lead to an increase in exports from the Dominion to the United States. Furthermore, a devaluation of the Canadian dollar would stimulate the production of gold in Canada, most of which is being sold to the United States, and thereby increase the supply of dollars. It could have no effect on the tourist trade since tourists can acquire Canadian dollars at the free rate of exchange. Should, however, a depreciation of the official rate be accompanied by a further decline in the free rate, it might stimulate the influx of American tourists, thereby increasing the supply of American dollars.

There are also negative factors, however, which must be considered by the Canadian authorities. In the first place, imports of Canada from the United States consist to a large extent of basic commodities such as cotton, fuel oil, and other raw materials which must be imported irrespective of price. Devaluation of the dollar would increase prices of these commodities in Canada, and since commodity prices in Canada, following the major decontrol order on Sept. 15, 1947, and subsequent removal of additional commodities from price control, have been arising, it is doubtful whether this would be desirable. Second, commodity prices in Canada, on the whole, are still lower than those prevailing in the United States, as may be seen from the accompanying table.

WHOLESALE PRICE AND COST OF LIVING INDEXES

	United States		Canada	
	Wholesale (1926 = 100)	Cost of Living (1935–39 = 100)	Wholesale (1926 = 100)	Cost of Living (1935–39 = 100)
August 1945	105.7	129.3	104.0	120.5
December	107.1	129.9	103.9	120.1
May 1946	111.0	131.7	109.0	122.0
August	129.1	144.1	109.3	125.6
December	140.9	153.3	112.0	127.1
May 1947	147.1	156.0	125.3	133.1
August	153.6	160.3	130.8	136.6
September*	157.4	164.0		139.4

* Preliminary figures.
Source: U. S. Department of Commerce, Survey of Current Business, various issues; Bank of Canada, Statistical Summary, various issues.

Under these circumstances, it is doubtful whether a devaluation of the Canadian dollar would lead to larger exports to the United States or would reduce imports from this country. The dollar shortage of Canada will probably be remedied through the adoption of the Marshall Plan, which will greatly reduce the dollar shortage in Europe and particularly in Great Britain. From the economic point of view, therefore, Canada has very little to gain from currency devaluation at the present time.

FOREIGN TRADE

By Grace A. Witherow
Office of International Trade, Department of Commerce

GENERAL

United States foreign trade, after reaching a relatively high level for a non-war year in 1946, showed an extraordinary expansion in 1947. Exports increased to a monthly average of $1,320,000,000 in the second quarter, and, although they declined from this high level in succeeding quarters of the year, the annual total reached a record value of $14,500,000,000. This was a gain of 49 per cent over the 1946 total of $9,739,000,000 and 76 per cent over 1920, which year recorded the previous high peacetime value of $8,228,000,000. It represented also a slight gain over $14,300,000,000 worth of goods exported in the high war year 1944, when lend-lease shipments comprised 80 per cent of the exports.

Imports increased to $5,500,000,000, although they also reached the highest value in the second quarter of the year and showed some decline in later quarters. The 1947 figures represented an increase of 12 per cent over the 1946 total of $4,908,000,000 and 4 per cent over the previous high value of $5,278,000,000 in 1920.

Rises in prices contributed nearly one-half of the increase in the value of exports and more than the entire increase in the value of imports from a year earlier. The year 1947 recorded the largest advance in import prices in many years, and the greatest since 1942 in export prices.

In terms of quantity, as measured by the index numbers in Table 2, which eliminate the influence of the fluctuation of price, total exports increased 25 per cent in 1947 over the total in 1946 and 157 per cent over the 1936-38 pre-war average. Imports, on the other hand, dropped nearly 5 per cent below the total in 1946 and showed only an 8 per cent gain over the average annual imports in 1936-38.

The great expansion in United States exports in 1947 resulted from large purchases by Western Hemisphere countries of the mounting supplies of manufactured articles available in the United States (in part supplied by European countries and Japan before the war), and the large amount of foodstuffs and increased supplies of materials for reconstruction secured by Europe and Asia. The volume of imports, although steadily showing an increase in value, will continue relatively small until such time as increased production in Europe and Asia makes greater amounts of goods available to other countries.

SIGNIFICANCE OF GAP BETWEEN EXPORTS AND IMPORTS

As shown by the data in Table 1, the wide gap between merchandise exports and imports was an outstanding feature of United States foreign trade in 1947. Although exports have been for many years regularly in excess of merchandise imports, and have shown balances in 1943 and 1944 as large as in 1947, the trade in these war years contained a predominant part of lend-lease supplies and those of 1946 a considerable amount of relief shipments. In 1947, merchandise purchased on "cash or credit" terms formed 95 per cent of total exports with imports balancing only two-fifths of this total.

The widened gap between exports and imports points to the economic disequilibrium still existing in world production and trade more than two years after the close of the war. While countries in the former theaters of war have made substantial headway in increasing industrial production, both Europe and Asia are still far from producing and supplying their pre-war share of world trade. Moreover, the poor harvests of 1946 greatly affected the total food supply of Europe. In contrast, the United States increased its industrial production by 87 per cent, and agricultural production, by 35 per cent in 1947 over 1935-39, and we made available a considerable proportion of this large output to foreign countries.

The United States cooperated with other countries in making notable contributions toward world recovery and an increase in international trade in 1947. The post-UNRRA aid granted, after lend-lease and UNRRA shipments ended, to Greece and other countries whose financial resources were practically exhausted, the credit extended, such as the loan to Great Britain and those of the Export-Import Bank to other countries, the sponsoring of the plan to finance a long-term recovery program for Western Europe, and the agreements reached at the Geneva Conference which aim to reduce trade barriers and increase the international exchange of goods, have contributed not only to the relief of hunger and want, but also to the rehabilitation of and the increase in output of many areas.

COMMERCIAL EXPORTS

Commercial, or cash-purchase, exports, were valued at $13,800,000,000 in 1947 as compared with $3,759,000,000 in 1945 and $7,965,000,000 in 1946. Including purchases made on both "cash and credit" terms, they formed 95 per cent of total exports, an increase from 38 per cent in 1945 and 82 per cent in 1946. The trade increased to a high monthly value of $1,352,000,000 in May but decreased thereafter to approximately $1,000,000,000 in the final months of the year.

OTHER EXPORTS

Exports of lend-lease goods and UNRRA supplies, which reached sizable figures in 1946, came to an end in 1947. The transfer of title to lend-lease goods was completed in 1946 and only relatively small amounts remained to be shipped in 1947. Of the total shipments, amounting to $22,000,000 in the period January-November, 1947 (72 per cent to USSR) more than 85 per cent had left the country before the middle of the year.[1]

Exports by the United Nations Relief and Rehabilitation Administration, which amounted to more than $1,000,000,000 worth of merchandise in 1946, declined to $386,000,000 in January-November, 1947. The United States Government terminated purchases for shipment to Europe in March 1947 and to Asia in June 1947, but goods previously arranged for and goods purchased by the Administration with "free funds" continued to be shipped to the end of the year.

There were other relief shipments made in the period January-November 1947. Greek-Turkish aid totaled $20,000,000; United States Foreign Relief, $134,000,000; and "Private Relief," $96,000,000. The last named group included shipments by the Red Cross, CARE, and other private agencies including church groups, but not the large number of non-commercial parcels sent by individuals which are not covered in foreign trade statistics. The non-commercial parcel post shipments to Europe and the Far East increased from $145,000,000 in 1946 to at least $180,000,000 in 1947.[2]

COMPOSITION OF EXPORTS

Finished manufactures, valued at $7,928,000,000, showed an extraordinary increase in January-November 1947. These articles, forming the largest of the economic groups of exports, as they regularly did for many years, accounted for 75 per cent of the increase of $4,800,000,000 shown in total exports. As a group, they formed 60 per cent of total exports compared with 49 per cent in 1936-38 and 52 per cent in 1946.

Exports of semimanufactures showed the largest percentage increase in January-November 1947 to reach $1,600,000,000 after recording a decline from wartime levels in 1945 and making only a moderate advance in 1946. The group, nevertheless, was only 12 per cent of total exports as compared with approximately 18 per cent in 1936-38.

Crude materials made only a slight gain to $1,455,000,000, after recording the outstanding increase among the economic groups in 1946, and, therefore, dropped in relative importance in the trade. These materials comprised 11 per cent of total exports as compared with 23 per cent in 1936-38 and 15 per cent in 1946.

Exports of foodstuffs advanced to a high value of $2,198,000,000 in January-November 1947, although the total quantity of food sent abroad was not as large as in January-November 1946. The increase was largely due to the advance in prices, which represented a more important factor in the rise in value of this group than any other. Foodstuffs dropped in the trade from 23 per cent in 1946 to 16.7 per cent of total exports in January-November 1947. They still showed, however, the largest percentage gain over pre-war 1936-38 average, when foodstuffs were only 10.5 per cent of United States exports.

COMMODITY EXPORTS

Among commodity exports, machinery, valued at $2,137,000,000, ranked first in importance in January-November 1947. Including industrial machinery, electrical apparatus, agricultural implements, and office machines, this group composed more than one-fourth of exports of finished manufactures. It showed an increase of 76 per cent as compared with the first 11 months of 1946, owing to expansion in sales of a wide range of commodities. Increases from a year earlier, as shown by individual items such as textile machinery radio sets, electrical appliances, air-conditioning and refrigerating equipment, and household refrigerators, ranged from 148 to 282 per cent. Exports of the large group of mining, well, and pumping machinery, after showing expansion in the war years and in 1946, increased by 95 per cent in the recent period. Moreover, construction and conveying machinery increased 144 per cent over 1946 trade, and also recorded a higher total than in any year of the war period.

---

[1] All lend-lease goods sent abroad after the close of the war went out on the basis of agreements reached with recipient countries which permitted them to take, on a loan basis, goods already contracted for and in many instances, ordered to specification.

[2] Estimates based on sampling of parcel-post records by the Department of Commerce—1946 data revised; 1947 data include preliminary estimate for last quarter.

Textiles and textile manufactures, which rose to a higher value in the first half of 1947 than in all of 1946 and amounted to $1,292,000,000 in January-November, ranked as the second largest commodity export. This group made up less than 5 per cent of United States exports of manufactures, including semimanufactures in 1936-38, but after showing marked increase in the war period and further gains thereafter, particularly in 1946, composed 14 per cent of the manufactures total in January-November 1947. Cotton yarns, as well as cloth, and wearing apparel, were exported in increased quantity in the recent period.

Automobiles, including parts and accessories, which also recorded a larger total at the end of the half year than in all of the preceding year, rose to a value of $1,014,000,000 in January-November 1947, and ranked as the third largest export. Shipments included 246,000 passenger cars and 256,000 motor trucks, these totals representing increases of 29 per cent and 98 per cent, respectively, over the 1936-38 annual average exports.

Iron and steel-mill products, valued at $750,000,000, chemicals and related products at $703,000,000, merchant vessels at $590,000,000, and petroleum and products at $501,000,000, moved into fourth, fifth, sixth, and seventh places among manufactured commodities. Steel and chemicals showed marked increase in the war period, remained at high levels in 1946, and made further large gains in 1947. Sales of merchant vessels became a large item of trade only in the recent period. Petroleum products increased in value in 1947 owing mainly to price advances, after falling off sharply in 1946 from the high wartime levels.

Together, these seven commodity groups—machinery, textiles, automobiles, iron and steel, chemicals, merchant vessels, and petroleum products—comprised 74 per cent of exports of manufactures, including semimanufactures.

Wheat, including flour, was the leading foodstuff exported in January-November 1947. Although shipments increased only 18 per cent in quantity, to 324,000,000 bushels, the high price contributed to an advance of 51 per cent in value to $814,000,000. Exports of other foodstuffs—meats, fats, dairy products, eggs, and vegetables—still continued large as compared with pre-war trade, but, nevertheless, showed considerable decrease as compared with immediately preceding annual periods.

Among crude material exports, coal made the largest advance from a year earlier and ranked as the largest among commodities in this group. Amounting to nearly 65,000,000 tons, valued at $576,000,000, in January-November, they were about 60 per cent larger than in January-November 1946 during which period shipments to Europe began. Coal destined to that continent in the recent period comprised more than one-half of total coal exports.

Unmanufactured cotton, usually the leading crude material export, declined to 1,250,000,000 pounds, or by 31 per cent, as compared with January-November 1946, and 53 per cent compared with the 11-month average for 1936-38. Valued at $386,000,000, cotton ranked as second largest crude material export. Unmanufactured tobacco, the third leading item of the group, amounted to 462,000,000 pounds valued at $249,000,000. This was a decrease of 23 per cent from the relatively large quantity of tobacco exported in January-November 1946.

WORLD DISTRIBUTION—EASTERN HEMISPHERE

Europe continued a main destination of United States exports in 1947, although shipments to this area were a less dominant feature of the trade than in 1946. Including exceptionally large amounts of wheat, coal, textiles, and steel-mill products, total exports to continental Europe, excluding the USSR, increased from $2,581,000,000 in January-November 1946 to $3,559,000,000. Exports of meats, dairy products, and raw cotton declined as compared with shipments a year earlier; nevertheless, the total exports in January-November 1947 were more than five times as large in value as in 1936-38. Exports to the United Kingdom and the USSR were also a smaller part of total exports than in 1946, and exports to Europe, including these two countries, were 36 per cent of total United States exports in January-November 1947, compared with 41 per cent in 1936-38 and 42 per cent in 1946.

Exports to the United Kingdom, which showed a decline in 1946 as lend-lease shipments ceased, increased by 35 per cent to $1,057,000,000 in January-November 1947. This represented somewhat more than double the 1936-38 average annual value of this trade. Because of reductions in lend-lease and UNRRA supplies, exports to the USSR dropped off by 61 per cent to $134,000,000 in January-November 1947.

Exports to the Far East, the area including south and eastern Asia, and Oceania, increased 56 per cent from 1946 to $1,779,000,000 in January-November 1947, a total more than three times as large as the value of trade in 1936-38. These shipments represented, however, 13 per cent of total exports in the recent period, whereas the area took 19 per cent of our exports in 1936-38. The January-November 1947 trade consisted of commercial trade to the extent of 92 per cent, while UNRRA shipments, valued at $132,000,000, and "private relief," valued at $6,000,000, made up 8 per cent of the total.

Africa and the Near East, a large area of the Eastern Hemisphere with which trade has expanded from before the war, took 7.8 per cent of total exports in January-November 1947 compared with 5.4 per cent in 1936-38 and 6.4 per cent in 1946. Exports to this area have grown from $160,000,000 in 1936-38 to $619,000,000 in 1946, and $1,040,000,000 in January-November 1947.

WESTERN HEMISPHERE

The Latin American countries stood out as the area which most largely expanded its purchases of United States merchandise in 1947. The 26 per cent of total exports received by them compared with 16 per cent in 1936-38 and 21 per cent in 1946. The trade valued at $2,513,000,000 in January-November 1947 showed an increase of more than 600 per cent over pre-war average and almost 100 per cent over January-November 1946. The purchases consisted largely of manufactured articles, and for such leading commodities as chemicals and related products, industrial machinery, iron and steel-mill products, electrical apparatus, and automobiles, they comprised from 30 to 47 per cent of total U. S. exports in the first half of 1947. American purchases of these and other articles continued large in succeeding months of the year.

Exports to Canada, the largest individual market for United States merchandise, showed less expansion in 1947 than trade with the other American countries and with Africa, but a greater increase than trade with Europe and the Far East. Fourteen per cent of total exports was destined to Canada as compared with 15 per cent in both 1936-38 and 1946. Although Canada felt the impact of the world shortage of dollars and imposed restrictions on imports and foreign travel in the closing months of the year, our exports to this market for the year will exceed $2,000,000,000.

IMPORT TRENDS

Foodstuffs and semimanufactured articles in the import trade showed larger increases in 1947 than the other economic groups. The foodstuff group made up 29.3 per cent of total imports, and semimanufactures 21.9 per cent. Finished manufactures were 17.6 per cent of imports, about the same proportion as in 1946, while crude ma-

1947	13,350	12,692	95.1	5,139	38.5	+8,211	+7,553

[1] Includes re-exports.

[2] Represents total exports excluding lend-lease, UNRRA and "Private Relief" shipments.

[3] Excess of cash-purchase exports over total imports or excess of total imports over cash-purchase exports.

[4] Preliminary; includes estimate for December.

terials comprised 31.3 per cent, a smaller share than in the preceding year.

Imports of a number of leading commodities increased in quantity in January-November 1947, particularly sugar in the foodstuff group, metals, wood-pulp, linseed oil, and tung oil, among semimanufactures, newsprint classed as "manufactures," and in the crude material group, crude rubber, copra, and non-ferrous ores. A number of principal imports declined in 1947, including unmanufactured wool, undressed furs, raw silk, and gem diamonds. The quantity and value of these and other commodities imported in 1947 appear in Table 5.

SOURCES OF IMPORTS

The American republics and Canada, which were sources of a little more than one-third before the war and nearly two-thirds during the period from 1942 through 1945, furnished 57 per cent of total United States imports in January-November

TABLE 2

INDEXES OF CHANGES IN QUANTITY, UNIT VALUE, AND VALUE OF UNITED STATES EXPORTS AND IMPORTS

Yearly Average and Year	Quantity	Unit Value	Value
Total exports of United States merchandise[1]			
1936–38	100	100	100
1939–41	135	102	138
1942–44	269	148	399
1945	197	167	328
1946	205	159	325
1947[2]	257	190	489
Imports for consumption			
1936–38	100	100	100
1939–41	104	105	109
1942–44	97	140	136
1945	107	155	166
1946	113	173	196
1947[2]	108	209	226

[1] Includes lend-lease exports from 1941 to 1947, inclusive; non-lease exports during period 1941–1946 is shown on page 413 of the 1947 issue of this publication.

[2] Preliminary; includes estimate for December.

1947. Africa and the Near East also nearly doubled the pre-war share and sent approximately 7 per cent of imports.

Imports from other leading areas increased from wartime low levels in both 1946 and 1947, but these have not yet regained the position they had in pre-war trade. The Far East supplied 19 per cent in January-November, 1947, about double the proportion in 1945, but still a far smaller share than the 31 per cent of total imports sent in 1936-38. Imports from the United Kingdom and continental Europe formed 3.6 and 9.3 per cent, respectively, of total imports in January-November 1947, both ratios representing advances from wartime lows; nevertheless, barely half as large a part as in 1936-38. Among the countries of Europe, the United Kingdom, Norway, Sweden, Netherlands, and Czechoslovakia supplied a larger value of imports in 1947 than in 1946; imports from Belgium, France, Italy, Switzerland, and other leading countries showed declines from January-November 1946.

Table 6 presents the value of United States imports from leading countries and areas in 1936-38, 1946, and January-November 1947.

FOREIGN TRADE POLICIES*

By Henry Chalmers
Consultant on Commercial Policy, Department of Commerce

GENERAL

International trade during 1947 was marked by the apparent paradox of abnormally high imports into most foreign countries over the greater part of the year, combined with a spreading tide of new official restrictions on the importation of products regarded as not entirely essential. In many countries, these restrictions apply especially to purchases from countries where payment needs to be made in dollars.

To a considerable extent, this situation was brought on by the disappointing slowness in European economic recovery and financial stabilization, which was aggravated by the severe weather, crop failures, and work stoppages of the past year. The continued unsettled conditions in various parts of the world, and the retarded resumption of trade with Germany, Eastern Europe, and the Far East, were also contributing factors. In quite a number of countries, however, particularly in the Western Hemisphere, the exceptional volume of their imports since the war has itself been partly responsible for the restrictive reaction. The high rate at which their peoples had been buying foreign commodities of various types since the war, well beyond the value of their current exports, could hardly have continued indefinitely. The consequent drain upon the exchange resources of those countries aroused their governments' concern, and led to the adoption of stricter import controls as financial safeguards.

SPREAD OF IMPORT RESTRICTIONS

Some signs of new difficulties had appeared in a few scattered countries during the spring of 1947, but the wide resort of governments to the restriction or closer scrutiny of imports of various classes of goods considered dispensable did not assume the proportions of a general movement until about mid-year. It spread with especial rapidity after the British attempt, beginning in July, to make other countries' holdings of the sterling proceeds from current transactions again convertible into dollars. The unexpectedly heavy run on the British dollar holdings that ensued, and the forced suspension of sterling convertibility in little over a month, came as a general shock.

It brought widespread realization that the disruption of the economies and of the commercial potentialities of many countries by the war had been greater than estimated, and that the expectations of an early return to more normal conditions of international trading had been over-optimistic. In quick reaction to this realization, many governments took steps to protect their own financial positions by closer regulation of their foreign trade.

During the early months of the year, indeed, a number of governments even in Europe had felt warranted in relaxing somewhat the licensing controls over their foreign commerce which have been the rule in so many countries since the war. By the close of 1947, however, new or tightened controls upon imports had been brought into operation in the great majority of foreign countries, in both the Western and Eastern Hemispheres.

SALIENT DEVELOPMENTS IN THE DIFFERENT REGIONS

Particularly drastic were the new restrictions on the importation of goods of secondary essentiality which have come to prevail in all the countries of western and northern Europe except Switzerland, and in practically the entire British Empire except the Union of South Africa. The sharp curtailment of the further purchases of many classes of foreign products ordered by the United Kingdom, France, and Canada in the fall of 1947 were probably the most publicized, but they formed only part of a long series of such actions during the year, varying mainly in their severity. They apply especially to purchases from dollar countries.

---

* For a fuller discussion of this subject, see series of articles in *Foreign Commerce Weekly* of U. S. Department of Commerce during February 1948.

Moreover, most of the European and British countries have become anxious to attain a closer balance in the annual value of their exchanges of merchandise with their various trading partners. Many of these governments have indicated their intention of favoring the importation of particular products from those sources where there would be involved least drain upon their foreign exchange, and of directing their exports more to those markets where payment can be had in "hard" currency, that is usable for purchases anywhere. To improve their over-all balance of international payments, a number of these governments are also working on various means for bringing about an increase in the volume of their countries' exports, often at the cost of restricting the quantities of certain national products made available to their own people.

Several of the Latin American Republics, which had developed extensive trade relations with the countries of Europe, especially with the United Kingdom, felt keenly this deterioration in the European commercial potentialities. For the majority of the countries of Latin America, however, the trade difficulties that developed during the year came chiefly as the result of their own heavy excess of imports over exports since the close of the war. By the latter months of 1947, all but certain of the Caribbean and Central American countries had in operation tighter controls over their imports than at the beginning of the year. Mexico and several of the South American countries have brought into effect wide increases in their import duties, partly for the protection of local producers. Chiefly, however, the new measures have taken the form of close selectivity as to which classes of foreign products were to be licensed for admission, or which were to be entitled to the means for payment promptly or at favorable rates of exchange.

In the countries of Eastern Europe, foreign trade has since the war been subject to a high degree of governmental direction, and in some cases to direct government buying and selling. During 1947, they were exceptionally active in the negotiation of agreements designed to bring about a closer orientation of their trade relations, over the long run, both toward the Soviet Union and toward each other. It was observed, however, that those Eastern European countries which had already rebuilt active commercial relations with the western countries took steps during 1947 to intensify them, and that most of the others sought to negotiate agreements with the countries of Western Europe for exchanges of the distinctive products which each was able to supply now or in the near future.

The year saw little abatement of the highly unsettled conditions in a number of important areas of the Far East, notably China and the Netherlands Indies, which have held back the full resumption of foreign trading with them. The setting up of the Dominions of India and Pakistan has thus far not altered the former system of trade regulation, although, as in the sterling areas generally, control of imports was again tightened here, and also in Burma and Malaya. The Philippine Republic continued exceptional, in its absence of import restrictions and in the return of practically all foreign trade to private channels.

A substantial beginning was made during the year toward the limited resumption of private trade with Germany and Japan, under license from the local officials, within the conditions set by the occupying military governments. Further steps are under consideration to facilitate the flow to world markets of the products for which their countries had been important sources of supply, and at the same time to increase their ability to pay for their own imports, so as to hasten the restoration of the German and Japanese economies to a self-supporting basis.

MOTIVES IN RECENT TRADE RESTRICTIONS

The recent adoption of import curbs by so many countries has seldom reflected changed attitudes by the peoples of those countries about the desirability of obtaining imported goods. Nor has it usually indicated a voluntary shift in governmental policy toward greater economic self-sufficiency. In most of the Latin American countries and several of the European neutrals, reports do indicate that the post-war satisfaction of the deferred demand for many consumer goods has been pretty well completed. In various lines of merchandise, a number of those markets are understood to be even overstocked. That condition is still very remote in most countries outside the Western Hemisphere, however, and in almost all countries the demand for equipment and materials for restoring and expanding local production and transport continues strong, often exceeding the supplies likely to become available for some time. In fact, several governments have expressed regret when announcing that some investment projects would have to be postponed or contracted because they required large outlays for imported capital goods, which they did not feel the country could now afford.

The prime motive of most governments which have recently tightened up on imports has been to readjust their countries' general buying programs to their reduced ability to pay for all the foreign goods desired, with the proceeds from current exports and with other means now available. In only a few countries, notably in Latin America, has the desire to foster local production of similar goods appeared as a primary motive in their recent restrictions upon the importation of particular foreign products. The temporary curbs on imports for conservation of exchange may have an incidental protective effect, but its importance would depend upon how long and how steadily the restrictions are kept in effect. It has been observed that the make-up of the restricted lists and of the categories of varying priority is subject to frequent change.

The size of the gap between the total imports and total exports of individual countries has varied considerably. Under the unusual postwar conditions, however, that alone has often not been the measure of a country's problem in carrying on its foreign trade. The strain upon the foreign exchange resources of many countries has been intensified by the commercial and financial difficulties of other countries with which they had important trading relations. For practically none of the war-ravaged countries has yet regained the level of production that allows a sufficient exportable surplus to pay for its current import needs. Moreover, with the notable exception of the Philippine Republic, they have not yet reached that stage of financial stability that would make their currencies freely convertible into other monies.

As a result, a country that has shipped goods to one of the war-disrupted countries to a greater value than that of the goods it has received from that country in return finds that it is holding, for that much of its exports, either an intentional credit that is not payable for some time, or a balance in a foreign currency that is not readily acceptable elsewhere. In either case, it has to that extent reduced its ability to settle for its own import balances from third countries, or to make new purchases where desired goods are obtainable.

Canada constitutes a striking instance of this character. The value of its over-all exports since the war has consistently been exceeding that of its imports. But so large a part of its shipments to European countries has been on credit, or has yielded only balances in inconvertible currencies, that the Canadian Government has had to keep drawing heavily upon its usable reserves to help pay for its traditional import balance from the United States, and finally found itself obliged, late in 1947, to resort to drastic restrictions on its imports.

It is partly to minimize strains of this character that a number of European and British countries are now trying to direct more of their exports to particular markets, which either are in a position to supply in return goods of the types particularly desired, or which can pay in dollars or other "hard" currency that is usable for purchases anywhere. Conversely, they are trying to shift the source of imports, wherever possible, either to those countries which can be paid in the same currency, as in the case of the sterling areas, or from which additional goods can be obtained against earlier export balances to them, without calling for further outlays of foreign exchange. When taking such action, the governments have often been at pains to disavow any intentional policy of discrimination against the goods or markets of particular countries, and to point to the compulsions upon them arising from the differing state of their trade balances with the various countries, and of their holdings of the other countries' currencies.

The tightened import controls of the year have usually been put forward as temporary measures to meet an emergency. However, unless bold and concerted action is taken before long to offset the lagging progress toward economic recovery and stability, especially on the part of the war-disrupted countries of Europe, the conditions which prompted the recent wide resort to new trade restrictive measures may well call for most of them to continue in operation for some time to come, even in some of the countries outside of Europe. In fact, at the opening of 1948, the governments of a number of countries were contemplating further restraints upon their imports, through increased duties, quantitative restrictions, or other means.*

DOLLAR SHORTAGE OR PRODUCTION SHORTAGE?

Since the present trade difficulties and restrictions of most countries arise mainly from financial limitations, especially in their relations with the major countries of the Western Hemisphere, the situation has been rather superficially described as one of "dollar shortage." As sometimes used, that term appears to imply a failure on the part of the supplying countries to conduct their affairs so that prospective customers have command of sufficient dollars to make the desired purchases. Actually, total importations into the United States and Canada, the two principal "dollar countries," have been running well above the pre-war rate, even when allowance is made for price rises. Significantly, however, the volumes of goods that have been obtainable from the Eastern Hemisphere countries, especially those of Europe, have been considerably below the pre-war rate.

The fundamental difficulty in the present world trade situation has arisen primarily from the serious imbalance between the different countries, following the war, in their relative productivity and financial resources. Particularly striking has been the unprecedented demand upon the productive capacity of certain countries of the Western Hemisphere, where the measure of purchasing ability is expressed in terms of dol-

* While the new import restrictions recently introduced by the various countries are cutting down the volume of new orders being placed abroad, their practical effects in curtailing the actual movements of goods are often not apparent until some months after their issue. This is due to the fact that large quantities of goods are usually en route or covered by firm prior order or import permit at the time, and that exemption or special consideration is commonly granted for such goods.

lars (U. S. or Canadian) or in currencies readily convertible into dollars (*e.g.* Cuban pesos). The so-called "dollar shortage" being complained of by many countries is thus seen rather as an indication of the insufficiency of their own production available for export, plus other means of payment, in relation to their current import needs. It is consequently the result, rather than the cause, of their inability to pay for all their desired imports from the "dollar countries," which happen to be those in the best position to supply them.

This imbalance in current resources has been accentuated by the fact that the import requirements of so many countries for replenishment and rehabilitation after the war have been abnormally high. In the case of most of the war-disrupted countries of Europe and Asia, the difficulty of meeting their exceptionally large need for commodities of many kinds has been rendered more acute by the disappointingly slow recovery in local production, especially of food, and in the general stabilization of their domestic economies. The exports of those countries during 1947 were still running considerably below imports, and their other pre-war sources of foreign income were greatly reduced.

Moreover, despite the cuts that have been made since the war in the external value of the currencies of various of the countries of continental Europe and of the Far East, considerable uncertainty is still felt as to the ultimate exchange value of many of them, especially in the case of those countries whose political position is unsettled or whose domestic economy is still far out of balance. Consequently, other countries, when unable to obtain from these countries equivalent return for their exports in goods particularly desired, have been anxious to avoid accumulating credit balances in currencies of doubtful stability or which are blocked from use elsewhere. Various countries in Europe and the Western Hemisphere have, in fact, not only been requiring the settlement of all trade balances at the end of stated periods in dollars or other "hard" currencies, but have been insisting upon partial payment in dollars for some of the essential commodities they supply.

SHRINKAGE IN MEANS OF COVERING TRADE DEFICITS

The difficulty of many countries in maintaining the volume of their imports has been increased by the fact that the alternative means which have been available to them during earlier post-war years for covering their trade deficits had shrunken considerably by the latter part of 1947. Shipping, foreign investments, tourists' expenditures, and other pre-war sources of alternative foreign income, which used to be so important to various European countries in balancing their international accounts, have recently been yielding only a fraction of their former amounts.

The governmental credits in various forms that had been extended by certain of the more prosperous countries during 1945 and 1946, especially to the former belligerent countries of Europe, and which had made possible a substantial part of the importations of those countries since the close of the war, had to be drawn on in increasing volume in 1947. Thus, whereas 20 per cent of the total U. S. exports of goods and services during 1946 were financed through credits, by the second quarter of 1947, foreign countries on the average had to draw upon credits to cover fully one-third of their purchases from the United States, and for certain individual countries the proportion was very much higher. It is not surprising that, by the latter months of 1947, most foreign countries found their unused credits approaching exhaustion.

The quantities of goods going abroad as relief supplies and gift shipments and as other unilateral transfers, which had accounted for another 20 per cent of United States exports in the preceding year, represented a much smaller proportion of United States exports in 1947, after the tapering off of UNRRA. A large part of the recent unilateral transfers have consisted of deliveries of basic essentials to the occupied areas. The United States foreign relief program of 1947, which was the principal successor to UNRRA, was confined to Austria, Greece, Italy, and Trieste. The emergency relief program for France, Italy, and Austria, approved by Congress in December, is intended to cover the shipment to those countries of the minimum requirements of food, fuel, and similar essentials for the next few months, pending the working out of longer-range plans.

Most countries which had reserves of gold and foreign exchange, or which had accumulated them during the war, have since been drawing upon them at an increasing rate to cover their current trade deficits. The foreign sales of gold to the United States and net drawings on official dollar balances during the first half of 1947 came to more than the amount for all of 1946. By late 1947, the principal countries known to be holding such reserves over the minimum needed to back their currencies or to finance their current flow of international trade were reduced to Switzerland, Portugal, Turkey, South Africa, the Philippine Republic, Cuba, Venezuela, Uruguay, and Argentina.

A number of foreign countries resorted during the year to requiring their citizens and enterprises to register their foreign-held balances and other assets, and to place them at the disposal of their governments, in return for the equivalent in domestic currency. The proceeds of such liquidations of foreign assets as are known to have taken place have apparently relieved the balance-of-payments position of those countries in only small measure.

The funds for reconstruction and development projects and to tide governments over temporary deficits in their balance of payments, which the International Bank and the International Monetary Fund, respectively, felt warranted in advancing during 1947, helped importantly in particular situations. The number of countries involved, however, has thus far been small.

In addition to the United States, a number of other governments have extended substantial trade credits since the war, in support of their own exports and to help other countries to obtain needed imports for which they were not yet able to pay. Most notable in this regard have been Canada, Sweden, Switzerland, Belgium, Argentina, and Brazil. By latter 1947, however, almost all of these lending governments found themselves over-extended, and made it known that they were not in a position to grant any further trade credits. In fact, they had become concerned over the inadequacy of their reduced exchange reserves to cover their own current import needs.

PROSPECT FOR MODERATION OF TRADE RESTRICTIVE TREND

It has become clear that, before a wide restoration of more normal trading and payment arrangements can be expected, especially on the part of most countries of Europe and Asia, considerable progress would have to be made in their rehabilitation. The volume of their production and of their exports would need to be increased, their current needs for food and other essentials more fully satisfied from domestic sources, the values of their currencies stabilized, and, in general, favorable conditions restored for the freer exchanges of goods and settlement of balances with other countries. The past year witnessed a good deal of earnest planning and courageous effort in these directions on the part of various countries. Particularly notable for the degree of planned cooperative utilization of joint resources toward common recovery was the program developed by the 16 countries of western Europe which conferred at Paris during the summer of 1947, under stimulus from the United States.

Increasingly, however, opinion has grown that the action which the United States would be prepared to undertake would be the decisive factor in the progress of the general recovery program, especially in tiding over certain war-disrupted countries until their own recuperative efforts, individually and jointly, have had time to work out and to bring results, and in assisting them to rebuild and expand their productive and trading capacities. During that recovery period, the ability of certain of those countries to maintain their importations at high level, even of the more essential types of products, and to avoid resort to greater discrimination against American commerce, will apparently depend largely upon the magnitude of the shipments to them which the United States may furnish or finance beyond their current ability to pay.

THE MARSHALL PLAN AND INTERNATIONAL TRADE PROSPECTS

If the Marshall Plan—under Congressional consideration at time of writing — should be substantially adopted, considerable quantities of goods would be supplied during the next few years, under loans or other special arrangements, to the countries of Europe which are ready to participate in the cooperative program for European recovery. In so far as the United States, by goods and funds, thus reinforces the program for self-help and reciprocal assistance on the part of European countries agreed to at the Paris Conference of 1947, and as those countries progress toward economic recovery and general stability, the basic pressures causing the recent spread of restrictive and arbitrary trade controls will have been relieved in the region where they have been most acute.

Considering that the countries involved in the European Recovery Program have normally accounted for nearly one-half of world trade, as they regain their ability to pay their own way, and in currencies acceptable for purchases anywhere, the present trade difficulties in other regions should also be eased. In fact, since it is contemplated that an appreciable portion of the commodities to be furnished, especially of those in short supply, shall be procured wherever obtainable outside the United States, other countries in the Western Hemisphere and elsewhere would be benefiting directly from the very initiation of this program, in the way of both larger markets and a more ample supply of dollars. Moreover, as the participating European countries are helped to increase their productivity, more goods would become available for export markets. Countries outside of Europe could thus be gainers in two ways. They would have additional sources of supply for their import requirements, and would not need to send so much of their export products to Europe on credit or against unusable currencies.

The events of the year demonstrated vividly how deterioration in the trade and financial position of one group of countries can create difficulties for various other countries with which they have important commercial relations. Conversely, if the European Recovery Program is even substantially successful, it should be bringing about conditions favorable to the relaxation of restrictions on international trade and payments also on the part of countries in other regions.

GENEVA TRADE AGREEMENT AND THE ITO CHARTER

Despite the present preoccupation of most countries with their immediate foreign trade difficulties and their recent resort to increasingly restrictive measures, the year saw marked evidence of a widespread recognition that it was desirable to work out long-term principles and programs, to be ready when relaxation of the current transitional pressures allows governments greater freedom of choice in their trade policies.

Representatives of 23 countries participated in the simultaneous negotiations held in Geneva in the summer of 1947 for the reduction of trade barriers in all forms. Eighteen of them also agreed upon a draft charter for an International Trade Organization, through which the member countries are to cooperate in bringing into general operation a detailed code of international conduct that is designed to promote trade expansion and economic development on a mutually advantageous basis. At the full International Conference on Trade and Employment, convened by the United Nations at Havana toward the close of the year, the Geneva group was joined by 40 additional countries, for the purpose of perfecting and adopting a definitive charter for the ITO in a form that would command wide adherence.

The first step taken thus far toward implementing this broad program has been the bringing into provisional operation in January 1948 on the part of nine countries, which together used to account for over half of all world trade, of the duty concessions to each other worked out at Geneva and also the easements with regard to other forms of trade control to the extent that their existing legislation allows. These countries are Australia, Belgium-Netherlands-Luxembourg (Benelux Customs Union), Canada, Cuba, France, United Kingdom, and the United States. However, all of these countries except the United States and Cuba, are now restricting the importation of many classes of goods, in order to bring their purchases into closer balance with their current ability to pay. Indeed, in recognition of the abnormal conditions in international trade now widely prevailing, the Geneva Agreement on Tariffs and Trade provides that, under certain circumstances, the obligation upon governments to avoid resort to quantitative restriction on imports or to apply them without discrimination may not be fully binding until March 1952.

On the other hand, in the case of many of the commodities on which the reductions in American duties have been made, few foreign countries are yet in a position to increase substantially the volume of their exports to the United States. Moreover, the official exchange rates of a number of countries, especially those of continental Europe, have come to overvalue their currencies, and the prices at which their products would now need to be sold in the United States are often reported as too high to induce volume purchases, even at the reduced duties. For the immediate future, therefore, the increase in international trade as a result of the new concessions in tariffs and preferences by these nine countries is not likely to be of large proportions.

Some time may elapse before any important number of additional countries conclude similar reciprocal trade agreements or make effective those negotiated at Geneva, and before the various governments signatory to the ITO Charter complete the necessary ratifications to make that binding. Even allowing for the postponed practical effect and for some defections, however, the steps taken are highly significant. For the first time in history, the nations normally accounting for the great bulk of world commerce have looked beyond their immediate limitations, and have agreed upon common principles and practices to govern their trade relations over the long-run, and these are distinctly more liberal and expansive in character than have been the actual trade practices of many of them for some time past.

The very existence of the Geneva Trade Agreements, and the wide acceptance in principle of the ITO Charter, with the prospect of each participating country ultimately sharing in the benefits from the concessions and undertakings by each of the many other participants, can have appreciable influence upon the general trend of post-war trade policies. They might well serve both as restraints upon the adoption during the emergency period of extreme measures which might later be difficult to change, and as setting the general direction and pattern toward which governments might be prompted gradually to adjust the methods of regulating their foreign trade, as they work out of the present abnormal conditions and regain the ability to choose among alternative courses of action.

PUBLIC ACCOUNTING

By Carman G. Blough
Director of Research, American Institute of Accountants

GENERAL

The solution to a large proportion of the problems which face countries where private enterprise still predominates is tied up in the satisfactory settlement of the conflicting claims of capital, management, labor, and government upon the proceeds of business operations. Consequently, the measurement of such proceeds assumes great importance. Because of the part the independent public accountant plays in assuring the reliability of this measurement, steps taken by the profession to maintain high standards of performance and to develop accounting and auditing procedures which will make this information more useful and reliable become correspondingly significant. Considerable progress in this respect was made during 1947. An unusually large number of important projects were completed, work on other projects carried over from the previous year continued to receive careful study, and new ones were started.

Developments in accounting and auditing procedures in America are closely identified with the work of the committee on accounting procedure and the committee on auditing procedure of the American Institute of Accountants. While the pronouncements of these committees do not have the force of rules or regulations, except when their adoption by the membership is sought and received, their acceptability has given them considerable authority. A review of the bulletins issued by the committees during the year and of the problems now under consideration reveals the questions in accounting and auditing procedure with which the public accountant has been particularly concerned during 1947. Much of the work of the committee on auditing procedure has been directed to a clarification of the qualitative standards of auditing and of the means by which these objectives are achieved. To a large extent the studies of the committee on accounting procedure reflect the accountant's desire to devise useful measures of the results of business operations.

ACCOUNTING PROCEDURES—INCOME AND EARNED SURPLUS

The question of what constitutes the most practically useful concept of income for the year is one on which there is much difference of opinion. On the one hand, net income is defined according to a strict proprietary concept by which it is presumed to be determined by the inclusion of all items affecting the net increase in proprietorship during the period except dividend distributions and capital transactions. The form of presentation which gives effect to this broad concept of net income has sometimes been designated the "all inclusive" income statement.

On the other hand, a different concept places its principal emphasis upon the relationship of items to the operations, and to the year, excluding from the determination of net income any material extraordinary items which, if included, would impair the significance of net income so that misleading inferences might be drawn therefrom. This latter concept would require the income statement to be designed on what might be called a "current operating performance" basis, because its chief purpose is to aid those primarily interested in what a company was able to earn under the operating conditions of the period covered by the statement.

The point at which these concepts result in the greatest variations in practice is in the treatment of material extraordinary charges and credits which have been recognized in the accounts during the period for which the income statement is prepared. Conclusions on the accounting treatment of these very important items are set forth by the committee on accounting procedure in *Accounting Research Bulletin No. 32,* "Income and Earned Surplus." In harmony with the views expressed in earlier bulletins, the committee stated that "there should be a general presumption that all items of profit and loss recognized during the period are to be used in determining the figure reported as net income. The only possible exception to this presumption," in the committee's view, "would be with respect to items which in the aggregate are materially significant in relation to the company's net income and are clearly not identifiable with or do not result from the usual or typical business operations of the period. Thus," the committee continues, "only extraordinary items such as the following may be excluded from the determination of net income for the year, and they should be excluded when their inclusion would impair the significance of net income so that misleading inferences might be drawn therefrom:

"(a) Material charges or credits (other than ordinary adjustments of a recurring nature) specifically related to operations of prior years, such as the elimination of unused reserves provided in prior years and adjustments of income taxes for prior years;

"(b) Material charges or credits resulting from unusual sales of assets not acquired for resale and not of the type in which the company generally deals;

"(c) Material losses of a type not usually insured against, such as those resulting from wars, riots, earthquakes and similar calamities or catastrophes except where such losses are a recurrent hazard of the business;

"(d) The write-off of a material amount of intangibles, such as the complete elimination of goodwill or a trademark;

"(e) The write-off of material amounts of unamortized bond discount or premium and bond issue expenses at the time of the retirement or refunding of the debt before maturity.

"Adjustments resulting from transactions in the company's own capital stock, amounts transferred to and from accounts representing a segregation or appropriation of surplus or general contingency and inventory reserves such as those dealt with in *Bulletins 28* and *31,* and adjustments made pursuant to a quasi-reorganization, should be excluded from the determination of net income under all circumstances."

CONTINGENCY RESERVES

The committee also directed its attention to the acceptability of charging to income provisions for two somewhat similar types of contingency reserves. In *Accounting Research Bulletin No. 28,* "Accounting Treatment of General Purpose Contingency Reserves," it took the position "that general contingency reserves, such as those created (a) for general undetermined contingencies, or (b) for a wide variety of indefinite possible future losses, or (c) without any specific purpose reasonably related to the operations for the current period, or (d) in amounts not undetermined on the basis of any reasonable estimates of costs or losses, are of such a nature that charges or credits relating to such reserves should not enter into the determination of net income."

Similarly, in *Accounting Research Bulletin No. 31,* "Inventory Reserves," the committee expressed the opinion that "inventory reserves, such as those created (a) for possible future inventory losses on inventories not on hand or contracted for, or (b) without regard to any specific loss reasonably related to the operations of the current period, or (c) for the purpose of reducing inventories other than to a basis which is in accordance with generally accepted accounting principles, are of such a nature that charges or credits relating to such reserves should not enter into the determination of net income and that they should not be used to relieve the income account of any year."

INVENTORY PRICING

In *Accounting Research Bulletin No. 29,* "Inventory Pricing," the committee set forth its views regarding the general principles applicable to the pricing of inventories of mercantile and manufacturing enterprises. As explained in the bulletin, "a major objective of accounting for inventories is the proper determination of income through the process of matching appropriate costs against revenues." The committee's conclusions with respect to the "cost or market, whichever is lower" principle is of particular interest. "In keeping with the principle that accounting is primarily based on cost," the committee stated, "there is a presumption that inventories should be stated at cost." It recognized, however, that "a departure from the cost basis of pricing the inventory is required when the usefulness of the goods is no longer as great as its cost," and stated that the measurement of losses from such sources is "generally accomplished by stating such goods at a lower level commonly designated 'market.'"

In the application of this rule, the committee believed there should be greater restraint in writing down inventories than has been common practice and, consequently, defined the term "market" as used in the phrase "lower of cost or market" to mean "current replacement cost (by purchase or reproduction, as the case may be) except that (1) market *should not exceed* the net realizable value (*i.e.,* estimated selling price in the ordinary course of business less reasonably predictable costs of completion and disposal) and (2) market *should not be less than* net realizable value reduced by an allowance for an approximately normal profit margin." Thus, a floor and a ceiling are placed on replacement cost in arriving at market.

CURRENT ASSETS AND LIABILITIES

Considerable variation and inconsistency exist in practice with respect to the classification and display of current assets and current liabilities. In *Accounting Research Bulletin No. 30,* "Current Assets and Current Liabilities—Working Capital," the committee discussed the nature of these items with a view to developing criteria to aid in the more useful presentation thereof in financial statements.

Recognizing that past practice in classifying these items tended to be overly concerned with immediate or forced liquidations, the committee took cognizance of the tendency in recent years of creditors to rely more upon the ability of debtors to pay their obligations out of the proceeds of current operations. Accordingly, current assets, for accounting purposes, were defined to mean "cash and other assets or resources commonly identified as those which are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business. The term 'current liabilities' is used principally to identify and designate debts or obligations, the liquidation or payment of which is reasonably expected to require the use of existing resources properly classifiable as current assets or the creation of other current liabilities."

INCOME CHARGES FOR PLANT COSTS

One of the problems brought about by the current high level of prices is that of what can be done to prevent corporate capital from being depleted because construction and equipment prices are now so high in comparison with pre-war costs. Obviously, if present costs continue, it will be necessary to replace existing facilities at considerably more than their cost, and that will require the tying up of additional capital in plant and equipment.

The committee on accounting procedure, mindful of the importance of a satisfactory solution to this problem not only for the stability of our economy but also for the fair presentation of financial statements reporting the results of business operations, has devoted considerable attention to various solutions proposed. Two of the most noteworthy proposals have been the propositions (1) that annual charges to income for depreciation of plant facilities should be based on the estimated replacement cost of the present facilities and (2) that income statements should bear a portion of the costs of construction during the period covered by the statement equal to the amount by which actual costs exceeded estimated "normal" construction costs.

The committee, in *Accounting Research Bulletin No. 33,* "Depreciation and High Costs," stated the conclusion that neither of these proposals provides a satisfactory solution to the present problem. In reaching this conclusion, considerable weight was given to the fact that any method adopted must be susceptible of objective tests, if published financial statements are to be useful to those who rely upon them. The concept that accounting procedures should be applied consistently—not only from year to year, but also with respect to both the balance sheet and income statement—was another consideration influencing the committee's decision.

Although the committee did not feel that these proposals were sufficiently satisfactory to justify a departure from previously accepted practices at this time, it did recognize the propriety of making annual appropriations of net income or surplus to reflect gross discrepancies between the cost and current values of productive facilities when replacement of such facilities at the higher price levels is contemplated and management deems such a procedure to be helpful. It also called attention to the fact that "plants expected to have less than normal useful life can properly be depreciated on a systematic basis related to economic usefulness."

STUDY OF BUSINESS INCOME

In this connection, special mention should be made of a three-year project commenced in 1947 by the Institute of Public Accountants with the financial assistance of the Rockefeller Foundation. The variety and importance of present-day uses of "income" statements make it essential that all users of such information be in substantial agreement as to the postulates governing the measurement of business income. One evidence of the present lack of such agreement is the recurrence of problems like that just discussed. Recognizing that a resolution of these conflicting views requires a clearer understanding of the nature of business income, the Institute initiated a survey and historical study of the word "income" and of the terms associated with it in business, economic and political fields.

The Institute and the Rockefeller Foundation have each made available the sum of $30,000 to be used over a period of three years in pursuing this study. A prominent member of the Institute will be general director of the project in association with a small executive committee. Information developed under the direction of the executive committee will be referred to a study group of 30 to 40 members, including accountants, members of the bar, specialists in taxation on income, economists, statisticians, commercial and investment bankers, business analysts, and representatives of government, labor, and management. It is contemplated that the results of the study will be published in a series of reports.

DISCLOSURE IN FINANCIAL STATEMENTS

The more widespread use of financial information, particularly by those who are relatively inexperienced in accounting and auditing procedures, has considerably increased the responsibilities of the independent public accountant. More than ever, he must satisfy himself through the exercise of sound technical procedures and informed judgments that the statements he certifies are not misleading either by misstatements or by the lack of important information.

The profession has constantly endeavored to evolve means by which users of financial statements may more readily determine the financial information they need, but is well aware that there is room for improvement. Careful consideration is being given as to whether the accountant should require a full set of financial statements (balance sheet, income statement, and an analysis of surplus) to be included in all published reports to stockholders of which his certificate is a part. Practices such as the submission of highly condensed financial statements; failure to disclose the amount of reserves netted against assets; use of omnibus reserves or reserves for unspecified contingencies without further explanation or information regarding charges or credits to them; failure to disclose the basis upon which inventories are valued or to give information as to the proportions of raw material, work in process and finished goods; lack of disclosure of the method followed in determining cost of inventories (such as last-in first-out, first-in first-out, or average cost); failure to state the basis of valuation of fixed assets; and failure to state the number of shares of stock authorized, issued and outstanding, as well as the par or stated value of the stock, are also under consideration by the committee.

AUDITING STANDARDS

One of the most significant accomplishments of the committee on auditing procedure during the year was the issuance of a "Tentative Statement of Auditing Standards—Their Generally Accepted Significance and Scope." Since 1941, when the short form of accountant's report now in general use was recommended by the Institute, accountants have customarily included in their reports an assertion that the "examination was made in accordance with generally accepted auditing standards." While these standards have been in existence and observed for many years, there has never been available an authoritative statement codifying and explaining just what they are. This the committee has attempted to do in its statement on auditing standards.

The substance of the generally accepted standards tentatively adopted by the committee may be summarized as follows:

General Standards—

1. The examination is to be performed by a person or persons having adequate technical training and proficiency as an auditor.
2. In all matters relating to the assignment an independence in mental attitude is to be maintained by the auditor or auditors.
3. Due professional care is to be exercised in the performance of the examination and the preparation of the report.

Standards of Field Work—

1. The work is to be adequately planned and assistants, if any, are to be properly supervised.
2. There is to be a proper study and evaluation of the existing internal control as a basis for reliance thereon and for the determination of the resultant extent of the tests to which auditing procedures are to be restricted.
3. Sufficient competent evidential matter is to be obtained through inspection, observation, inquiries and confirmations to afford a reasonable basis for an opinion regarding the financial statements under examination.

Standards of Reporting—

1. The report shall state whether the financial statements are presented

in accordance with generally accepted principles of accounting.

2. The report shall state whether such principles have been consistently observed in the current period in relation to the preceding period.
3. Informative disclosures in the financial statements are to be regarded as reasonably adequate unless otherwise stated in the report.

CASE STUDIES IN AUDITING PROCEDURE

Auditing procedures are the means by which the independent auditor attains or complies with the generally accepted auditing standards applicable to field work. Auditing procedures are so numerous and should be varied so greatly to meet particular circumstances that it is not possible to make an enumeration of procedures which would be applicable generally, or even widely. Experienced professional judgment, therefore, determines the scope and nature of auditing procedures to be followed in each individual engagement.

The committee believes that the most satisfactory method of presenting auditing procedures is by the presentation of a series of case studies illustrating the auditing procedures adopted and applied in actual examinations. Accordingly, each member of the committee was requested to submit a comprehensive description of audit work actually performed on a complete engagement.

So far, six case studies have been issued. They deal with the audits of companies of the following types: No. 1—A Loading and Hauling Equipment Manufacturer; No. 2—A Newspaper Publisher; No. 3—A Department Store; No. 4—A Public Utility; No. 5—A Corn Processing Company; and No. 6—A Management Investment Company of the Open-End Type.

The committee hopes that the case study material will serve a useful purpose not only within the profession but also in the various colleges and universities throughout the country which offer advanced instruction in accounting and auditing subjects.

ACCOUNTANT'S REPORTS

The end product of the public accountant's professional work is usually a report in which he states what he has done and, if appropriate, expresses an opinion regarding the fairness of the presentation of the financial condition and results of operations in the company's financial statements. This report is frequently of considerable length and may comment in detail upon various phases of the audit, specific items in the financial statements and various aspects of the company's accounting procedures and practices. Such reports are usually designed for the use of the management of the company or for others qualified and required to use such detailed information.

When financial statements are to be published for the use of the general public, however, it is believed that such detail serves no useful purpose and in many cases leads to confusion and misunderstanding. Accordingly, a very brief report, stating concisely what the accountant has done and his opinion on the statements is considered appropriate. In the interest of greater uniformity and understanding of these reports, a short form of report or "certificate," recommended by the Institute as a standard, has been adopted quite widely by the profession.

Accounting and auditing are highly technical subjects, however, so it is not surprising that, as accountants' reports have come to receive greater attention from the general public, certain misconceptions have arisen regarding what this short form of report means. To clear up these misunderstandings, the Institute, during 1947, issued a pamphlet, "What Does an Auditor's 'Certificate' Mean?" explaining in everyday language what each statement in the standard short form of the accountant's report is intended to say. While the pamphlet was prepared primarily for the information and guidance of the staffs of bankers and other credit grantors, it should be equally useful to investors and others who rely on information in financial statements.

Efforts are also being made by the committee on auditing procedure to develop a more readily understandable form of report. Because other projects have been considered to be of greater immediate urgency, consideration of this problem has been somewhat limited. During 1948, however, the committee plans to apply itself more actively to the question.

The committee has also taken steps to correct another source of confusion to users of financial statements; the presentation of financial statements on the stationery or in a report of an independent public accountant without a definitive expression clearly indicating the representations he is making as to their fairness. When statements are presented in this manner to those who do not have special information regarding the preparation of the financial statements, these third parties have no basis for determining what inferences are warranted by the association of the accountant's name with the financial statements and may place undue reliance upon them.

Since the accountant can not effectively control the use to which financial statements accompanied by his name may be put, the committee believes the profession should adopt practices which will minimize the possibilities of uncertainties and misinterpretations by third parties. To accomplish this the committee, in *Statements on Auditing Procedure No. 23,* recommended that, "whenever financial statements appear on the stationery or in a report of an independent certified public accountant, there should be a clear-cut indication of the character of the examination, if any, made by the accountant in relation to the statements, and either an expression of opinion regarding the statements, taken as a whole, or an assertion to the effect that such an opinion can not be expressed. When the accountant is unable to express an over-all opinion, the reasons therefor should be stated. When the accountant considers it appropriate to comment further regarding compliance of the statements with generally accepted accounting principles in respects other than those which require the denial of an over-all opinion, he should be careful to indicate clearly the limits of such comments."

Since these recommendations entail a modification and extension of a position taken by the committee in an earlier statement which was formally adopted by the Institute membership, it was believed that they should be placed before the membership for formal consideration. Accordingly, the committee's statement has been issued on a tentative basis pending formal action by the membership in 1948.

LEGISLATION

Legislation regulating the practice of public accountancy not only affects the conditions under which the certified public accountant practices his profession, but also raises important questions of public policy. The growing reliance of the general public upon the opinions of public accountants as to reliability of financial information makes it mandatory that no legislation jeopardize the quality of such opinions. Experiences of recent years, however, reveal a desire by some to relax the requirements for admission into the ranks of certified public accountants. Feeling that the public will be better served if standards are maintained at a high level, certified public accountants have resisted these efforts.

Of particular concern to these accountants during the year, was the passage in New York State of a bill frequently referred to as the "Oliver Bill." This legislation permits the issuance of a certificate without examination to applicants who present evidence of 15 years experience in the intensive application of accounting principles and auditing procedures satisfactory to the State Board of Certified Public Accountants, subject to review by the Commissioner of Education. In signing this bill, the Governor indicated that the powers granted under it will be used only in exceptional cases and that the high standards of public accountancy in New York must not be lowered. The profession feels, however, that satisfactory completion of an adequate written examination is an important measure of the competence of an applicant for a CPA certificate and that passage of this bill may lead to more serious lowering of professional standards.

Of similar concern to accountants is what appears to be an attempt by a few members of the legal profession to restrict or impede the practice of public accountants before certain governmental administrative bodies and before the Tax Court. The accounting profession has taken the position that there are frequent cases in which the accountant is especially qualified to handle the interests of clients appearing before such bodies and that, if public accountants are not permitted to carry on such practice, clients will have to engage additional professional help unnecessarily and may not be as well represented.

INCOME TAXATION

While no major Federal income tax legislation was enacted during 1947, it was a year in which much consideration was given to possible general tax revisions and to the lowering of taxes. These matters are, of course, directly related to a large part of the public accountant's work. It is hoped that, during the coming regular session, Congress will find opportunity to make changes in the tax laws to conform income tax regulations more closely to generally accepted principles of accounting and to remove many of the inequities which exist in the present tax procedure. This is a big task and one regarding which accountants would be especially glad to be of assistance.

During March 1947, Justice Bernard L. Shientag, in rendering a decision in the "Bercu case" in the Supreme Court of New York County, ruled that certified public accountants who give advice to taxpayers and interpret income-tax laws are not engaged in illegal practice of law. This decision was most encouraging to certified public accountants who felt that their right to give tax advice, which for 30 years had been assumed to be a proper and legitimate activity of the accounting profession, accepted by taxpayers and the governmental taxing authorities alike, had been unnecessarily attacked by the legal profession. It is to be hoped that the Bar Association will accept this clarification of the question, and will continue to cooperate with the accounting profession, through the state and national conference groups which have been formed for that purpose, in the development of working methods through which lawyers and certified public accountants can be most helpful to their clients and to each other in tax practice.

CONCLUSION

Because of the diverse nature and far-reaching implications of developments in public accountancy during 1947, it has been impossible in this discussion to do more than summarize the principal topics that have arisen. This summary should show, however, that public accountancy has made significant progress during 1947. It is believed that the future holds equal promise for the profession's continuing contributions to the welfare of our economic system and the public it serves.

LIFE INSURANCE

By JAMES S. ELSTON

ASSISTANT ACTUARY, THE TRAVELERS INSURANCE COMPANY

LEGAL RESERVE INSURANCE IN FORCE

The legal reserve life insurance in force in regular United States companies Dec. 31, 1947 is estimated by the Life Insurance Association of America at about $190,500,000,000, 9.1 per cent greater than at the end of 1946, the previous highest amount. This includes $125,600,000,000 Ordinary insurance, $31,600,000,000 Industrial, and $33,300,000,000 Group.

The new paid-for business for 1947, not including revivals or increases, is estimated at $23,400,000,000, a decrease of .3 per cent over 1946 but an increase of nearly 50 per cent over 1945 and of 30 per cent above the previous record of 1929. The new Ordinary is approximately $16,000,000,000, 3.4 per cent below the 1946 record but about 29 per cent above the next highest record of 1929; the Industrial $4,600,000,000, 2.7 per cent above the previous highest amount of 1946, and the Group $2,800,000,000, 15.6 per cent above the previous record of 1946. The insurance lapsed and surrendered was slightly greater in absolute amount than the previous comparative minimum (1946) but possibly not as a percentage of the amount in force. The combined assets are estimated at $51,500,000,000, an increase of about 6 per cent, and the payments to policyholders and beneficiaries at $3,000,000,000, of which about 43 per cent represents death claim payments to beneficiaries, and the balance payments to living policyholders.

LEGAL RESERVE LIFE INSURANCE *

(Dollars in Millions)

	Income—Disbursements			Assets—Liabilities—Surplus	
	1946	1945		1946	1945
Total Premium Income	$5,727	$5,249	Real Estate	$ 735	$ 857

† Includes amount set apart for dividends to policyholders during following year and special, voluntary, contingency, etc., reserves.

NEW ISSUES—TERMINATIONS—INSURANCE IN FORCE

	1946	1945	1946	1945
	Ordinary Business		Group Business	
New Issues and Increases	$ 16,776	$ 10,944	$ 6,111	$ 1,519
Terminations:				
Death	925	937	183	179
Maturity	240	248	—	—
Surrender	895	641	7	22
Lapse	2,168	1,459	194	176
Other	940	758	307	2,850
Total	5,168	4,043	691	3,227
Insurance in Force	116,110	104,456	28,196	22,770
	Industrial Business		All Lines of Business	
New Issues	4,842	3,970	27,729	16,433
Terminations:				
Death	217	236	1,325	1,352
Maturity	150	161	390	409
Surrender	607	340	1,509	1,003
Lapse	2,035	1,604	4,397	3,239
Other	301	274	1,548	3,882
Total	3,310	2,615	9,169	9,885
Insurance in Force	30,247	28,497	174,553	155,723

As the "Other Disbursements" item in the first table includes $346,000,000 paid to beneficiaries under supplementary contracts, it will be seen that the investment income was more than sufficient to meet all expenses. The total paid policyholders and beneficiaries together with the amount reserved to meet future policyholder claims was greater than the premiums paid by policyholders.

There is also about $7,500,000,000 insurance in force in fraternal orders and assessment organizations and $2,300,000,000 U. S. Government Life insurance on veterans of the First World War. The present amount of National Service Life Insurance, resulting from the war, is about $36,000,000,000. Various restrictions in the original act were removed by Congress which liberalized the conditions in 1946 and in February 1947. In a very successful campaign, the Veterans' Administration, veterans' organizations, and life underwriter associations joined in conserving existing and reinstating lapsed policies, nearly 1,000,000 of which for $6,000,000,000 were reinstated, offsetting approximately the year's terminations.

DISTRIBUTION OF INVESTMENTS

A distribution of investments at the end of 1947 is based on estimates by Bruce E. Shepherd, Manager of the Life Insurance Association of America, as:

	1947	1946	1941
Government bonds	39.3%	44.8%	20.8%
State and local bonds	1.2	1.2	6.1
Dominion of Canada bonds	2.5	2.6	1.9
Public utilities securities	14.3	12.7	15.5
Railway securities	5.9	6.3	9.0
Corporate securities other than railway and public utilities	11.0	8.7	6.7
Farm mortgages	1.7	1.7	2.8
City mortgages	14.9	12.9	17.9
Policy loans and premium notes	3.8	3.9	8.9
Real estate	1.6	1.6	5.7
Cash and miscellaneous	3.8	3.6	4.7

There was an increase of about $39,000,000 in the Canadian bonds held and of about $90,000,000 in the real estate. The laws of a number of states, which have always restricted life companies to holding real estate only for purposes of home or branch office use and for the satisfaction of mortgages in default, now permit acquiring real estate under certain conditions primarily for investment purposes. For quite a number of years as fast as they could, while at the same time protecting their policyholders, the companies have been liquidating the real estate acquired during the depression through foreclosure until it was almost all sold. the increase in 1947 was the result of substantial investments in housing projects and in certain types of commercial real estate to be leased for retail purposes.

NET RATE OF INTEREST EARNED

The net rate of interest earned in 1946 dropped under 3 per cent for the first time. The 1946 rate was 2.92 per cent, compared with 3.07 per cent in 1945 and 3.61 per cent in pre-war 1940. The rate has been declining almost continuously since 1925, when it was about 5.25 per cent. For the first time in a number of years, it appears that in 1947 the average interest rate earned on new investments may have increased moderately, partly because of the slightly higher rate available in recent months on bonds, but largely because of the moderate decline in percentage of assets invested in government bonds, and of the increase in percentages invested in corporate securities and mortgage loans, and real estate for investment purposes.

Manager Shepherd observes: "It should be borne in mind, however, that the overwhelming volume of outstanding investments held by life insurance companies is in long-term securities acquired under less favorable investment conditions. Thus the effects of the reduced earning power of life insurance funds which has been the heritage of depression and war will continue to be felt for some time even though yields on new investments improve." When the interest earnings of the life companies are reduced, death claims and other payments to policyholders and beneficiaries must be met by a corresponding increase in premiums or a reduction in dividends.

STATE LEGISLATION

Reviews in recent years have commented on the effects of the United States Supreme Court decision that insurance is interstate commerce. Public Law 15, adopted by Congress in March 1945, provided among other features "that the continued regulation and taxation by the several states of the business of insurance is in the public interest"; and the business of insurance shall be subject to the laws of the several states and "no act of Congress shall be construed to invalidate, impair, or supersede any law enacted by any state for the purpose of regulating the business of insurance, unless such act specifically relates to the business of insurance, provided that after January 1, 1948" but not before, the Sherman Act, the Clayton Act, and "the Federal Trade Commissions Act shall be (subject to certain conditions) applicable to the business of insurance to the extent that such business is not regulated by state laws." Congress has granted an extension to June 30, 1948.

In a review of the 1947 insurance legislation Charles C. Klocksin says that "the most intense efforts in the legislative sessions which occurred in most of the states were centered on the program of the all-industry and insurance commissioners' committees in order to meet the requirements of Public Law 15. Proposals of the all-industry committee, or bills similar to it, establishing rate-making procedures for fire and marine insurance and for casualty and surety business, have been enacted in all but a handful of states. Fair trade practice bills designed to place on a state level the provisions of the Federal Trade Commission's fair trade practices act were approved in 17 states. A number of states have long had statutes relating to unfair insurance practices, such as anti-discrimination, anti-rebating, misrepresentation, and fraudulent advertising. It is not unlikely that some of these jurisdictions will conclude that their present statutes are adequate and go as far as are necessary in the circumstances. The conduct of the insurance business itself, and the wise and effective administration of these laws, will be major factors in ultimately determining the adequacy of state regulation.

"It must be recognized that since the Supreme Court's edict was handed down, great strides have been made in preserving the system of state regulation of insurance, and while the task of the all-industry and insurance commissioners' committees has not been completed there are hopeful signs of its consummation in the near future. It seems fair to say that neither Congress nor the Federal agencies concerned are likely to intervene while progress in this direction is being made."

STATE REGULATION OF NON-FORFEITURE VALUES, ETC.

As explained in reviews in recent years, the new non-forfeiture and valuation laws became effective on business issued after Jan. 1, 1948. During 1947, the remainder of the states except Oklahoma (and the District of Columbia), which had not already passed this legislation, made it at least permissive. Never in the history of life insurance has such a thorough revision of non-forfeiture values, premium rates, and wording of the policy contracts themselves been necessary. In connection with the latter, the companies have, of course, taken advantage of the situation to make other improvements which they have had in mind. Thus, for the first time, the reserves and non-forfeiture values may be based on such a modern mortality table in all states except Oklahoma. In some states, this is permissive only instead of required, and some companies doing business in a limited number of such states will continue on the old table.

It is estimated that 96 per cent of the insurance paid for hereafter will be on the C.S.O. reserve basis. In most companies the premium rates have been increased and the non-forfeiture values increased at the same time. This situation might be misunderstood as the effect of only the new mortality table itself would be to reduce premiums. Increases in premiums are due to the assumption that the companies will earn a lower rate of interest. In general, term premiums, in the calculation of which the interest rate is relatively unimportant, have been reduced. A few companies had already made a change to a lower interest rate and their present changes are comparatively slight, although some of these that made reductions in interest assumptions recently have made further reductions now.

SPECIAL INSURANCE COMPILATIONS

Several special compilations, some based on special requests for information to the companies, have been made this year by the Institute of Life Insurance. There has been a great increase in the amount of life insurance used to protect small loan and mortgage borrowers under borrowers' group insurance. This form of insurance more than doubled in 1946, and there was nearly $600,000,000 in force at the end of the year. The number of borrowers was nearly 5,300,000, an increase of 64 per cent in the preceding 12 months. The number of lending institutions using the plan was nearly 7,500. There is a wide range of type of loan covered under this group protection, including small bank loans, installment purchase accounts, and mortgage loans on homes. A large part of the larger loans that are insured are covered by individual policies, written under term or ordinary insurance plans on the individual borrower's lives.

VETERANS HOME LOAN INSURANCE

Another report shows that more than $500,000,000 has been advanced to veterans by the life insurance companies for home loans under the G.I. Bill of Rights. This represents only a part of the home financing extended to veterans by the life insurance policyholder funds, as many veterans have financed their home purchases through direct loans, without calling on the special provisions of the G.I. Bill of Rights.

DISTRIBUTION OF INSURANCE INCOME

In a tabulation by the *Spectator* the distribution of $1.00 income of life companies for 1946 is worked out approximately as follows:

Death Benefits	$ .162
Paid Living Policyholders	.203
Settlement Options	.053
Added to Assets to Enable Companies to Pay Future Benefits	.412
Total	.830
Commissions and Agency Expenses	.074
Home Office Salaries	.021
Taxes and Fees	.018
Investment Expenses and All Other Operating Costs	.033
Total Expenses	.146
Asset Adjustments (Profit or Loss)	.024
Total	$1.000

LIFE ANNUITIES

At the beginning of 1947 there were over 2,966,000 life annuities in force for an aggregate annual income of $932,400,000, of which $216,100,000 was actually being paid, $352,700,000 deferred but paid-for, and the balance being paid for. The total was divided between $549,500,000 individual annuities, $317,400,000 group annuities covering 1,696,000 American workers, and the balance supplementary contracts involving life contingencies payable to insured after maturity of endowments and to beneficiaries after death of the insured. The use of benefit payments in this way is an anti-inflationary factor, helping to hold back large sums from current spending and building up future purchasing power as a stabilizing force.

DISABILITY PAYMENTS

The Institute also reported that approximately $500,000,000 of life insurance was kept in force during 1946 for disabled policyholders without payments of premiums under disability clauses attached to their life policies. These premiums will be waived as long as the total disability continues. A large proportion of life insurance includes this feature. In addition to the premium waiver benefits, disability income benefits of $74,000,000 were paid to disabled policyholders in 1946.

ENDOWMENT AND DEATH SETTLEMENTS

Forty-four per cent of life insurance benefits available in 1946 under endowment and death settlements under ordinary and group policies were used to set up continuing income plans for policyholders or beneficiaries, a new high in the proportion of funds used for this purpose. The 1946 aggregate of funds set aside for future income payment was $586,000,000. The total of such funds left with the life insurance companies for payment under these income plans now amounts to approximately $3,800,000,000, an increase of $1,300,000,000 in the past three years. The increase has been progressive from year to year, as a larger proportion of the available benefits has been placed under income settlements. As recently as 1930, only 10 per cent of the then smaller benefit payments were used for income plans, and in 1920 the percentage was only about 5 per cent.

According to another Institute report, more than 4,000,000 "extra-rate" life insurance policies, representing total life insurance protection in excess of $8,000,000,000, are owned today by persons with physical impairments or special occupational hazards. Such purchases of new life insurance in 1946 under about 500,000 policies were more than $1,800,000,000, representing about 8 per cent of the total new life insurance paid for.

A special survey of the Institute analyzes the causes of the deaths among policyholders in 1946, as follows:

DEATH RATES PER 100,000

	Ordinary		Industrial	
	1941	1946	1941	1946
Organic Diseases of the Heart	208.3	237.2	167.7	228.3
Cerebral Hemorrhage	58.3	54.9	63.2	71.1
Cancer	100.8	101.6	104.7	106.6
Tuberculosis (all forms)	23.7	17.5	43.1	40.8
Pneumonia (all forms)	24.5	19.2	36.5	33.9
Nephritis	36.6	25.9	49.3	37.8
Diabetes	15.0	9.9	26.2	23.1
Suicides	18.7	15.0	9.1	6.8
Homicides	1.5	1.6	3.7	5.9
Motor Vehicle Accidents	24.2	19.0	22.3	15.8
All Other Causes	202.9	187.5	261.7	198.4
Total All Causes	714.5	689.3	787.5	768.5

It is probable that the 1947 death rate set a new low record despite increases from heart diseases and cancer.

WOMEN AND JUVENILE INSURANCE

Projecting a survey of a group of representative life insurance companies, the Institute estimates that women's purchases of new life insurance during 1946 amounted to well over $3,000,000,000, a new record annual volume. Life insurance owned by women reached a new peak in 1947, being estimated at over $35,000,000,000.

The Institute estimates that purchases of juvenile life insurance approached the $2,000,000,000-mark in 1946, that in the ordinary business representing 8 per cent of total sales, and that in the industrial 36 per cent of the total. The greater part of the juvenile life insurance purchased was on children under five years of age.

INCREASE IN LIFE INSURANCE STUDY

There has been a notable increase in the study of life insurance in the colleges and universities of the country recently and this increase would have been even larger had the facilities not been limited by lack of teaching manpower. The last report available shows that more than 200 colleges and universities provide one or more courses in insurance, 85 of them having special courses in life insurance. The Life Office Management Association estimated that more than 2,000 employees in about 180 life insurance company head offices and branch offices were studying for one or more of their examinations, this being twice the number recorded in the previous year. The American College of Life Underwriters reports that the special work in connection with the C.L.U. degree (Chartered Life Underwriter) was being materially expanded. A few universities have held special courses for advanced training in life underwriting.

LIFE INSURANCE EMPLOYMENT

An estimate of the Life Insurance Agency Management Association indicates the following approximate number of persons in full-time employment:

	January 1, 1947	
	Men	Women
Home Office	32,700	61,700
Agency Cashiers and Clerks	3,900	28,900
Agents and Agency Managers	165,200	5,300
Total	201,800	95,900

POLICYHOLDER SURVEY

A survey conducted by the Service Research Center of the University of Michigan as a part of a consumer study made for the Federal Reserve Board indicated an average of 2.3

life insurance policyholders per family among the U. S. families which are insured, and nearly half of all families have two or more policyholders. The word family here means "spending unit." Eliminating the family units which have no life insurance policyholders, three-fifths of all insured families were found to have two or more policyholders. Only 22 per cent of United States families were found to have no life insurance and these were in large part families with incomes below $2,000 annually. Half of the families with incomes of less than $1,000 owned some life insurance, and almost three-fourths of the families earning $1,000 to $1,999 had at least one life insurance policyholder. The ownership of life insurance by 78 per cent of United States families compares with a 47 per cent ownership of savings deposits, 56 per cent ownership of U. S. Savings Bonds, and 76 per cent ownership of liquid assets of any type.

FIRE INSURANCE

By Edward R. Hardy
Secretary Emeritus, Insurance Institute of America, Inc.

FIRE LOSSES

Following the usual practice of presenting the fire loss statistics, set forth below, month by month, are those for the three year period 1945, 1946, and 1947. These statistics are collected and published by the National Board of Fire Underwriters, and the value in using them is that they are collected on a uniform basis which has been the Board's practice now for some years. Hence, this degree of uniformity makes it possible to make comparison from year to year.

FIRE LOSSES BY MONTHS

	1945	1946	1947
January	$44,865,000	$49,808,000	$57,180,000
February	41,457,000	51,759,000	64,247,000
March	40,876,000	53,252,000	72,435,000
April	37,950,000	51,153,000	68,029,000
May	34,153,000	45,094,000	56,545,000
June	34,090,000	44,240,000	50,840,000
July	34,054,000	40,998,000	49,357,000
August	34,096,000	40,019,000	51,359,000
September	32,447,000	40,256,000	47,990,000
October	34,470,000	40,108,000	54,946,000
November	37,393,000	44,706,000	51,346,000
December	49,478,000	58,094,000	68,361,000
Total	$455,329,000	$461,478,000	$692,635,000

Only a casual glance at these statistics will show that for the year 1947 the fire losses exceeded those of 1946 by $131,157,000, and 1945 by $237,306,000. No words could add to the impressiveness of this statistical summary, for the purpose of showing the enormous increase in the past years' losses. All of this is not to the credit of the American property owner.

It is customary for the *Journal of Commerce,* from its daily record, to keep a list of the fires where the loss is reported at $10,000 or more, and for the month of December 1947, the geographical distribution was reported as follows:

East	161	$11,393,100
West	179	13,507,000
South	79	4,131,000
Pacific Coast	56	4,108,000
Canada	47	2,944,000
Total	522	$36,083,100

These statistics, it should be observed, account for only a small part of the total losses. It is the remaining number, so to speak, of smaller losses that make up the extraordinary total of over $692,000,000 for 1947. These losses in this amount or above, *i.e.* $10,000 or above, run fairly even through the year. This being so, then something over one-half of the total losses were due to fires where the loss was $10,000 or above.

UNUSUAL HURRICANE AND EXPLOSION LOSSES

These type of losses are largely covered by the fire insurance companies and while the damage in part follows from the fire, the initial cause, the losses are not wholly due to fire but must be included in this brief summary.

Texas City, Tex.—This loss, which was estimated at $50,000,000, probably proved to be less in the final close-up, was due to an explosion aboard a vessel in the dock. The exact cause will probably not be known but it is estimated that the claims would number at least 7,500, exclusive of industrial claims. The industrial loss is estimated at $35,000,000. Also, it is estimated that the automobiles destroyed numbered between 1,000 and 1,500. In such cases, it is customary for the central body to set up a special office for settling the losses. This was immediately done in this case.

New Orleans Hurricane.—The latest report shows that the losses from the hurricane in New Orleans on Sept. 19, 1947, had amounted to something over $2,500,000. There were many properties involved, it being reported that 28,000 claims had been listed, the damage divided between the Mississippi Gulf and Louisiana. The higher proportion (24,000) was in Louisiana. The average claim in Mississippi was $350 while the average claim in Louisiana was $110.

Florida Hurricane.—This occurred on Sept. 17, 18, and 19, 1947, and swept Florida and the North Gulf Coast. The best figures available show the estimated losses at something over $12,000,000, the claims being widely distributed.

Bar Harbor Fire Loss.—Much attention was attracted to the fires in the State of Maine because of the large loss at the famous summer resort at Bar Harbor. A conservative estimate put the losses at $6,000,000 due to the fires in Maine, and in some cases the losses were put even higher, including the non-insured losses. These losses occurred not only in Maine but also in New Hampshire.

It has been suggested that all, at least smaller cities and towns, might develop a form of protection which would follow the operation of planning what to do in case any such untoward disasters occur. Before the famous hurricane of 1938 in New England, this had been done in Westerly, R. I., with the result that, when the storm came, the committees went into action automatically and prevented a much larger loss of life and property damage than would otherwise have been the case.

STANDARD POLICY OF FIRE INSURANCE

This policy, with slight variations, has now been adopted by 44 states, Alaska and Hawaii, and the District of Columbia. The variations in any case are not important, except possibly that they meet some peculiar legal condition. The other states have their own policy, as in California, where it is a part of the law of the state. This grew out of the earthquake and conflagration of 1906. Massachusetts has had its own policy for approximately 75 years and has been loath to change it.

It is desirable that, just as far as possible, a uniform policy be adopted for all of the states. To bring that about is difficult, and this may be illustrated by the fact that, when the standard policy of 1887 was adopted in the State of New York, it was also adopted by the State of Michigan, with a change in one word. That, of course, has now passed away with the new policy.

LEGAL CHANGES

In regard to the Supreme Court decision of 1943, it will be recalled that this important decision changed the law of 75 years, when the Supreme Court decided that the states had the right to control the method of conducting the insurance business within their borders, to the dictum that the United States Government had a part therein. This made such a tremendous change that, by agreement between the companies and the United States Government and the states as well, the states and the companies would have until Jan. 1, 1948 when they were supposed to have all of their proposed workings in order and adopted by the states. The time proved to be too short and was extended to July 1, 1948. The important question involved in this matter is really the rate-making question, and it appears that some 35 states have passed rate laws and work remains to be done for the others to adopt their measures before July 1, 1948. To have accomplished what has been done is a matter of commendation to the states and the companies, and it may quite safely be said that the remaining states will then adopt the measures which will be approved by the state and the United States Government. Should, however, any state fail to do so and the time not again be extended, then in those states the United States Government may play a more important part in conducting the business than in those states where by mutual agreement requirements have been adopted.

The thought that is sought to be conveyed by a good deal of this report is that much remains to be done, and a year from now a more proper summary of what has been done will be available.

MARINE INSURANCE

By Henry C. Thorn

Manager, North America Companies, New York

GENERAL

The Marine market, in common with the Fire and Casualty markets, experienced in 1947 a tremendous increase in volume of business respecting both amounts insured and premiums. As this article is being written in December, it is too early to tell just what the underwriting results will be, but it is apparent to all that they will not be good, though probably better than the Fire or Casualty Companies experience.

The year was one of serious disasters such as *Texas City*, the explosion at Brest, and numerous ship accidents. In addition to all this, the losses from theft and pilferage were staggering. The whole moral let-down that followed the war continues, and in some parts of the world the seaports are reduced to a state bordering on anarchy. The political upheavals in Europe and the Far East added to the severe labor unrest that is worldwide, naturally presented thieves with opportunities that would not exist to any such degree in a more ordered world.

THE SECURITY BUREAU, INC.

This is not to say that nothing is being done about this serious situation. Early in the year the Marine Underwriters, in conjunction with the shipowners of all nationalities operating out of the Port of New York, including Towboat, Stevedores, Motor Truck Operators, Warehousemen, Dry Docks, Shipyards, Watching Services and other Maritime interests, set up at considerable expense The Security

Bureau, Inc., an organization composed entirely of former experienced F.B.I. agents and headed by a former chief agent. It has made great progress in cooperating with various law enforcement agencies, Federal, state and city, to the end that port thieves are prosecuted vigorously and other protective measures installed that are bound, as time goes on, to make pillaging of cargoes in the Port of New York, at least, far more difficult than in the past.

This Bureau is attracting wide attention in other ports of the United States, and it is likely that somewhat similar organizations will be created. It has also been most favorably discussed in the great London Marine Insurance market as well as being brought up at the meeting of the International Union of Marine Insurance held at Cannes, France in September. All of this is a healthy sign. While the perils of the sea, fires, wars, and like perils are more or less beyond the control of man, losses due to theft, and poor packing, too, can very definitely be controlled, at least to a certain extent.

EXPORT PACKING FACTOR

As to the question of packing for export, American shippers, with certain notable exceptions, are far behind the exporters of the other leading maritime nations. The situation has been troubling the carriers quite as much as it has the underwriters. Progress is being made toward educating exporters, but some scheme must be worked out, and one with teeth in it, if we are to stop the terrific losses that our commerce has to bear traceable to breakage, thefts, water damages, and other sundry injuries that improperly packed merchandise is subject to. There is obviously no comparison in the stresses, strains, and risks that overseas shipments are subjected to in comparison with moving goods by land conveyances in our domestic trade. It will cost much money, time, and effort to improve packing generally, but it will be well worth the effort and expense if our goods arrive in good shape overseas. Obviously, not only will customers be better satisfied, but as results improve, so will the Marine Insurance premiums be reduced. The rates are largely based on the underwriting results—this should be obvious to all who are engaged in overseas trade.

PREMIUM RATES

As to premium rates, these are very materially higher than they were in pre-war days. One notable achievement of the year was the amalgamating of the Marine Extension Clause and rates with the basic coverage and premiums. In spite of the higher scale now prevailing, the rates are not sufficiently high to offset the steady stream of losses occurring in nearly all trades and in all parts of the world.

Strange as it may seem, the volume of War Risk carried is greater even than during the war itself. Naturally the rates are lower, for the risks of capture, seizure, and destruction by men-of-war, submarines, and planes no longer exists, but the risk of ships hitting unswept mines is still serious and will probably continue for a long time. Many casualties have occurred since the cessation of hostilities, and practically all cargoes are insured against this hazard.

POST-WAR MINE LOSSES

It will probably be somewhat surprising to the average person how real a hazard these mines are, in spite of the vast amount of sweeping that has been done by the Allied Navies. The *Liverpool Journal of Commerce,* April 30, 1947, reported that since the end of the war up to that time, there had been 246 casualties. It is not the loss by flags that counts in this post-war mine loss, but the casualty areas. As might have been expected, the North Sea accounted for 37, the South Baltic for 30, and other Scandinavian waters next, with the Mediterranean, English Channel, and Adriatic following in close order. Naturally this does not mean that these vessels were all totals, as a large percentage were able to get into port. It is also interesting to note that in July 1947 the United States Coast Guard reported that a First World War mine was sighted in the vicinity of Cape May, New Jersey. It was blown up by the Philadelphia Navy Demolition Unit.

According to the best records available in the American market there have been approximately 100 vessels total losses, 106 damaged, and on the remainder the information is not complete. The latest casualty occurred to a Panamanian tanker which struck a mine off Denmark on Dec. 10, but succeeded in reaching port. It should be made clear that the figures quoted above are for merchant vessels only, of the seagoing type, and do not include naval vessels, minesweepers, and similar craft.

HULL INSURANCE

Premiums are naturally very much greater than in pre-war days, owing to the great increase in shipbuilding in America as a wartime measure, and not only is the fleet tremendously enlarged, but the values of the vessels far exceed pre-war figures. The losses have been heavy, and the bad weather, especially in the Western Ocean, continues. It is too early to foretell what the combined underwriting results will be, but the profit if any, is bound to be small. Not only have the major casualties been great, but the wartime "Liberties" especially have developed severe rudder and propeller claims in numerous instances. Competition with London continues to be severe.

One can not view the Maritime labor situation, as it exists in the American Merchant Marine, without concern, not only to the present day operations of ships but the probable bad effect on our future as the world's greatest Maritime nation. This is the position our country faces as a result of the war.

There are some favorable factors, however, that must not be overlooked and that will have a direct bearing on future hull underwriting. Some of these are the great technological advances in ship and engine building, the tremendous possibilities of Radar, Loran, and other modern gadgets that will eventually be in common use. There is also the great human element involved, and this refers to the very superior type of young ships' officers being trained and highly educated by the Government and states, the chief institution being the United States Merchant Marine Academy at Kings Point, New York. Several thousand of these young graduates are now manning the Merchant Fleet. The importance of this scientific four-year training can not be exaggerated, for when all is said and done, the safety of a sea venture rests finally in human hands.

The American Market for Marine Insurance is much more internationally minded than in the past. It is encouraging foreign business to come here, and many of the local companies are expanding their underwriting to foreign fields. This trend has been gaining impetus and, unless all signs fail, will continue.

NATIONALISTIC LAWS

One of the outstanding events of the year that gave all Marine underwriters, of whatever nationality, great concern was the enactment of strict nationalistic laws governing Marine and other insurance in Argentina. This philosophy has been spreading and may continue to do so. It is most unfortunate for all concerned, assured as well as underwriter, for if any business is international in character it is surely Marine Insurance. Such restrictive legislation is bound to have an adverse effect on overseas commerce and at a time when the world needs the free flow of goods, services, etc. between nations. In this connection, it is very significant that foreign insurance companies may, after complying with the laws of our various states, do business in America on a free competitive basis with domestic companies. When we refer to the American Marine Insurance market we always include the admitted foreign companies. It happens during this time that these foreign companies are mostly British, but in past years German, Italian, French, Japanese, Scandinavian and others have operated freely in the United States. It is the earnest hope and desire of many companies of American origin to be permitted the same privilege throughout the world, but while some foreign countries welcome the idea, a great many countries have enacted restrictive legislation that prevents this.

CASUALTY INSURANCE AND CORPORATE SURETYSHIP

By William Leslie

General Manager, National Bureau of Casualty Underwriters

STATE LEGISLATION

During 1947, the legislatures of 44 states and of Alaska, Hawaii, and Puerto Rico, met in regular session. An unusual volume of important regulatory legislation affecting casualty insurance and corporate suretyship was enacted.

Continuing the program of legislation growing out of the United States Supreme Court's decision in 1944 holding insurance to be commerce, and the enactment by Congress of Public Law 15 in 1945 declaring that continued regulation of the insurance business is in the public interest and that the Federal anti-trust laws will be applicable to the business of insurance after the moratorium period (Jan. 1, 1948) to the extent that the business is not regulated by state law, 30 * additional states and Alaska and Hawaii adopted casualty and surety rate regulatory statutes. With similar laws enacted in 1945 and 1946 and several laws enacted prior to the Supreme Court decision, only six states—Idaho, Missouri, Oklahoma, Rhode Island, Virginia, and West Virginia—the District of Columbia, and Puerto Rico do not as yet have comprehensive casualty and surety rate regulatory laws. These rate regulatory statutes are designed to meet the impact of the Sherman Antitrust law.

Additional legislation, having in mind the other Federal Anti-trust statutes, was also considered. Thus, with respect to the Federal Trade Commission Act, 17 states (Florida, Indiana, Maryland, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Jersey, New Mexico, Pennsylvania, South Carolina, South Dakota, Tennessee, Utah, Washington, and Wisconsin) passed State Fair Trade Practice measures; to meet the possible application of the Robinson-Patman Act, state statutes specifically authorizing payment of commissions to brokers and prohibiting unfair discrimination and rebating were adopted in nine jurisdictions (Arkansas, Colorado, Connecticut, Hawaii, Maryland, Massachusetts, New Hampshire, North Dakota, and Pennsylvania); and to meet the possible effect of the Clayton Act, laws regulating interlocking directorates and investment in stocks of other insurance companies, were passed in three states (Connecticut, Illinois, Pennsylvania).

Special statutes regulating accident and health insurance were enacted in 19 states: Colorado, Connecticut, Delaware, Florida, Indiana, Maryland, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Mexico, New York, Ohio, Oklahoma, South Carolina, Vermont, Washington and Wisconsin.

Most of the above statutes were

---

* Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Georgia, Illinois, Indiana, Iowa, Maine, Massachusetts, Michigan, Minnesota, Montana, Nebraska, Nevada, New Hampshire, New Mexico, North Dakota, Ohio, Oregon, Pennsylvania, South Carolina, South Dakota, Utah, Vermont, Washington, Wisconsin and Wyoming.

based in whole or in part upon standard bills formulated by the All-Industry Committee representing all segments of the insurance industry in cooperation with a committee of the National Association of Insurance Commissioners.

Supreme Court decisions in 1946 *Prudential v. Benjamin,* 328 U. S. 408, and *Hobbs v. Pacific Mutual,* 328 U. S. 822) dispelled the fear that the tax imposed upon foreign companies by retaliatory laws and the favored tax treatment of domestic companies, violated the Commerce Clause of the Federal Constitution. Hence, three states (Maine, Maryland, Oregon), which had repealed their retaliatory laws, now re-enacted them, and six states (Arkansas, Maine, North Carolina, Oklahoma, Oregon and Washington) again amended their premium tax laws to restore exemption of or lower the rates for domestic companies.

Other important state legislation included amendments of the Workmen's Compensation laws of some 25 states increasing benefits thereunder. Several additional states brought occupational diseases under their workmen's compensation laws. The problem of payment of compensation under the Workmen's Compensation laws to partially disabled employees sustaining subsequent injuries continued to have attention, and seven additional states (Alabama, Nebraska, New Hampshire, South Dakota, Texas, Vermont, West Virginia) enacted laws setting up special Second Injury Funds to take care of such compensation.

New or completely revised and strengthened financial responsibility laws were enacted in nine states (Alabama, Colorado, Florida, Idaho, Iowa, North Carolina, North Dakota and Wyoming). The effective date of the 1945 new Pennsylvania Financial Responsibility Law was postponed for two years until July, 1949.

Multiple line legislation was adopted in 13 additional states: California, Colorado, Idaho, Indiana, Iowa, Michigan, Minnesota, Montana, New Hampshire, New Jersey, New Mexico, New York and Utah.

FEDERAL LEGISLATION

The most important bill, insurancewise, passed by Congress was an amendment to Public Law 15 to extend the moratorium thereunder for six months, until June 30, 1948. Casualty and surety rate regulatory legislation for the District of Columbia was introduced in the first session of the 80th Congress but was not finally acted upon and will be considered in the second session beginning in January, 1948.

WORKMEN'S COMPENSATION INSURANCE

Marked progress in the development of an adequate system of rating plans for workmen's compensation insurance was made in 1947. Two important new plans were promulgated by the National Council on Compensation Insurance: Interstate Experience Rating Plan and Retrospective Rating Plan D.

The Interstate Experience Rating Plan will help solve the rating problem for risks with multiple locations in different states, which has been augmented in recent years by the industrial trend toward decentralization of operations. As a matter of sound governmental policy, as well as sound economic policy, businesses are diversifying their operations into multiple locations. It is obvious that such a plan is necessary if interstate bus, trucking, and air transport risks, for example, are to be properly rated. Moreover, contracting concerns take on projects in different states and do not confine their operations to a particular state or area. This decentralization of industry and growth of interstate operations, together with an accompanying increase in premium volume, created a demand on the part of insureds for a method of rating which will effect an over-all adjustment based on the combined interstate experience of the risk. The experience of a risk operating two or more plants within a single state has always been subject to combination for experience rating purposes, and it was difficult for insureds to understand why a combination of experience for rating purposes should be denied merely because one or more locations happened to be in a different state. Further, interstate rating is consistent with the new legal status of insurance as interstate commerce.

Briefly, the Interstate Experience Rating Plan provides that a risk shall qualify for interstate experience rating if it qualifies for rating on an intrastate basis for any one state that has approved the Plan. The average experience modification developed on the basis of the individual risk's combined experience will be applicable in all states in which interstate rating applies. Such modification will also apply to any new operations undertaken in states where the Plan is approved.

Retrospective Rating Plan D provides for the optional combination for retrospective rating purposes of third-party liability insurance with workmen's compensation insurance in the states where Plan D is approved. It is a formula plan under which the maximum and minimum premium ratios are not rigidly fixed, but may be selected in advance by the insured and the carrier to fit the requirements of each risk, with the proper insurance charge for the selected values and the proper allowances for expenses and contingencies being provided for in the basic premium ratio and loss conversion factor established. The eligibility requirement is a standard premium of $5,000 or more for the coverages rated under Plan D. For many years, underwriters have considered the over-all experience of a risk for all third-party liability lines in passing upon it. The majority of insurance buyers take the same view; they are concerned with the various types of coverage but, in the final analysis, the important question is whether or not the total cost for third-party liability insurance properly reflects the hazards of the risk's own operations. With the advent of rate regulation for liability insurance, in addition to workmen's compensation insurance, the need for an actuarially sound and practicable plan, more closely relating insurance cost to the requirements of the individual risk, became of increasing importance, and Plan D was developed to fill this need.

In 1947, the National Council completed its comprehensive field analysis for the purpose of determining whether a satisfactory substitute for payroll as the exposure base could be found, and whether it is feasible to incorporate a limitation of payroll for premium computation purposes. The conclusion was reached that total payroll offers the only universally available exposure base, and is the most readily verifiable of any base that has been found. Furthermore, employers are strenuously opposed to any increase in record keeping or to any increase in the expense involved in record keeping. The adoption of any new exposure base, or further payroll limitation, would undoubtedly require employers to increase and further refine the records now maintained, with attendant confusion and added expense.

Recognizing that it is to the best interest of the public and insurers to establish rates that will be as accurate as possible for the period during which the insurance is afforded, it was concluded that present rating methods might be improved if a way could be found to give over-all recognition, state by state, to the aggregate effect of factors that produce underwriting results either better or worse than those contemplated by the present rate-making procedure. The National Council, accordingly, made a new effort to develop a rate level correction factor based on underwriting results within a specified period in the recent past and limited in its effect to a moderate percentage decrease or increase in the rate level otherwise determined. It was felt that this would be far superior to the impractical alternatives of modification of the premium base or application of wage factors in the determination of rate level.

The program developed by the National Council provides for the application of an over-all rate level correction factor for each state which will produce a 1 per cent change in rates, subject to a maximum departure of 5 per cent, for each two percentage points that the earned-incurred loss ratio for the state for the two latest calendar years combined is above or below the state's permissible loss ratio by more than a neutral zone of two percentage points.

GENERAL LIABILITY INSURANCE

The first comprehensive revisions since 1939 in the rates, rules, and classifications for general liability insurance were completed during 1947. In general, the revisions resulted in reductions in rates, broadening of coverage without additional premium charge, clarification of language to express underwriting intent more clearly, the adoption of many new classifications, particularly for product liability insurance, and revisions in existing classifications.

The rates for all classifications of risks for all lines of general liability insurance, except contractual liability, were reviewed in connection with the revisions. The effect of the revisions countrywide was a reduction in the bodily injury and property damage liability rates for basic limits. The results, however, differed substantially from line to line and even more substantially from classification to classification within line. Further reductions were effected through revisions of the increased limits tables for manufacturers' and contractors', owners' or contractors' protective and contractual liability insurance. The reductions in the increased limits tables resulted in uniformity in these tables for the several kinds of general liability insurance.

One important change affecting all manuals related to limits of liability. Factors for limits in excess of $500,000 per person and $500,000 per accident for bodily injury liability insurance and in excess of $100,000 per person and $500,000 aggregate for property damage liability insurance were eliminated. Such factors will now be determined for each risk individually. In cases where aggregate limits apply for property damage insurance, a new rule was adopted providing that such limits are determined for each risk individually where the estimated annual premium for basic limits is $2,000 or more. For product bodily injury liability insurance, a similar rule applies where the estimated annual premium for basic limits is $5,000 or more.

An outstanding feature of the revisions was the introduction of a complete medical payments rating program for risks rated on an owners', landlords' and tenants' liability basis, and for elevators in such risks. Medical payments insurance had been available previously on a manual basis for residence and farm risks only and was written on a limited basis for other types of risks. The rates for this coverage are a percentage of the owners', landlords' and tenants' or elevator bodily injury liability basic limits premiums and apply on a per person per accident basis, basic limits being $250 per person and $10,000 per accident. A standard provisions endorsement for the coverage for use with the standard comprehensive general liability policies was also made available.

Included in the significant classification changes was the adoption of new classifications for owners', landlords' and tenants' liability insurance for drug stores. These classifications exclude, both on and off the premises, the handling or use of or the existence of any condition in products sold, after possession is relinquished to others. For product liability insurance, many new classifications were adopted and other classifications were reworded and clarified. Examples of these are classifications relating to air conditioning, heating and refrigerating equipment, clothing, millinery and other wearing apparel, retail drug stores, frozen food, radio, television sets, and phonographs.

Revisions of the national policy

program were also adopted in the latter part of the year. Affected were the standard provisions for the comprehensive general and comprehensive general-automobile liability policies, and endorsements for use with such policies.

AUTOMOBILE LIABILITY INSURANCE

In 1947 it was recognized that the post-war automobile liability rate increases announced in 1945 and 1946 had proved to be insufficient to make it possible for companies to meet the mounting loss costs and the greater accident frequency which had prevailed since the termination of gasoline rationing. Accordingly, on Feb. 17, 1947, the third post-war rate increase was promulgated in most states with similar rate increases in other states after approval by the supervisory authorities.

Companies continued to feel the pressure brought upon surplus by higher loss costs, increasing unearned premium reserves due to greater premium volume, and the depressed investment income resulting from stock market conditions. One company which operated in 26 states was forced to discontinue, with the result that the insurance industry had to assimilate numerous additional automobile liability risks required by law to purchase such insurance. Several states requested Automobile Assigned Risk Plans in order to meet the needs of risks which were unable to purchase automobile liability insurance. The National Advisory Committee on Automobile Assigned Risk Plans initiated steps to develop a simplified plan for adoption and use in all states having such plans.

On Dec. 1, 1947, the Fourth Revision of the Standard Provisions for Automobile Liability Policies was announced. This revision accomplished considerable simplification and clarification of policy language with some further broadening of coverage.

Simultaneously with the announcement of the Fourth Revision of the Automobile Liability Policy a complete revision of the Rules Section of the *Automobile Casualty Manual* was promulgated. In addition to rule changes necessary to place the manual in complete accord with the policy revision, many improvements in and clarification of rules were incorporated in the manual, including medical payments rates for all types of automobiles and additional increased limits tables designed to facilitate the use of the manual by manual holders. This revision constitutes the first complete revision of the manual rules since before the Second World War.

BOILER AND MACHINERY INSURANCE

The year is notable in the annals of Boiler and Machinery Insurance as having produced a minimum of Manual and policy changes. The coverage formerly known as "Off Premises Explosion," which provided indemnity for loss on the property of an assured resulting from an explosion of boilers, pressure containers, or machinery not owned or controlled by the assured, was extended to provide indemnity for an assured's liability for loss on the property of others in his care, custody, or control, resulting from such an explosion. The name of the coverage was changed to "Non Ownership Insurance" as more adequately defining the coverage, and provision was made for affording this coverage by use of an endorsement attached to the General Boiler and Machinery Policy rather than providing it under a separate policy as heretofore.

The year also saw the introduction of the Premium Adjustment Rating Plan for Boiler and Machinery Insurance. This is a retrospective rating plan for optional application to boiler and machinery risks developing standard premiums of $25,000 or more ($5,000 or more in Texas). The object of the Plan is to afford a basis of insurance for large risks for which the Manual rates do not adequately reflect the variations in conditions from risk to risk, and it is a formula rating plan similar to the Automatic Premium Adjustment Rating Plan in effect for the liability lines. The rating values consist of a fixed charge ratio, minimum and maximum premium ratios, and a loss conversion factor.

BURGLARY, THEFT, AND ROBBERY INSURANCE

It is anticipated that the premium volume for the burglary insurance lines for 1947 will substantially exceed the record high of the previous year. However, losses were of grave concern to the companies, particularly with respect to the Residence and Outside Theft and Mercantile Safe Burglary Policies. As a result, a program was developed to curtail some of the coverage under the Residence and Outside Theft Policy which was substantially broadened in 1943. Because the difficulty is principally due to the outside theft coverage, the policy limitations will be largely applicable to this feature. Owing to the fact that substantial rate increases were recently effected, it is believed that further increases would price the policy out of the market in most areas and therefore would not be a practical solution to the problem.

Another major event was the broadening of the Safe Depository Liability Policy to give effect to the recommendations of the banking business. Among the principal changes adopted is an automatic retroactive restoration provision which will provide retroactive reinstatement of the limits of liability following a loss without the payment of an additional premium. The policy also covers, without additional premium to the insured, property of customers stored in the bank's vaults which is too cumbersome to place within safe deposit boxes. By reason of these and several other changes designed to suit the coverage to the customary practices of banks in conducting a safe deposit business, it is felt that the revised policy will prove popular and will materially enhance its sale.

A fact of particular interest was the apparent turning point in the rate of criminal activity throughout the country. According to the figures released by the Federal Bureau of Investigation, covering offenses known to the police during the first six months of 1947, the increases in robbery and burglary, particularly sharp during the past two years, showed some leveling-off tendencies with increases of only 1.5 and 2.1 per cent, respectively. Larceny too, which was showing marked increases during the war, rose only 1.1 per cent during January-June, 1947, over the same period of 1946.

GLASS INSURANCE

The outstanding development in the glass insurance field was the decision of the majority of the insurance companies to limit the term of policies to a period of not more than one year. This action was brought about by the uncertainty of glass replacement costs which were increased considerably during the year. It has been found that the increase in replacement costs of certain types of glass has not been in proportion to the increases of plain plate glass; therefore, a program has been developed to adjust the rate scale for such glass to conform with the general rate increase which was put into effect during the past year.

ACCIDENT AND HEALTH INSURANCE

The remarkable growth of this branch of insurance, so noticeable during the past few years, continued, particularly in the field of group insurance and hospitalization. Accident and health premium volume for all types of carriers, including life insurance companies, reached a new high of over $750,000,000 in 1947, making it the foremost casualty insurance line by premium volume. An estimated 60,000,000 persons were insured by insurance companies and Blue Cross plans. Loss ratios, favorably affected the past several years by wartime full employment and greatly restricted use of the automobile, now threaten to climb appreciably with the full scale and increased use of the automobile, increased medical, surgical, and hospital costs arising out of the generally increased cost of living, rapid development of an increase in air travel, and expected fluctuations in the economic cycle.

Public interest in accident and health insurance continued its unprecedented growth, and insurers increasingly tried to meet the demands with desired coverages. Medical, surgical, and hospital expense coverages appeared to increase in popularity, as did the franchise or wholesale method of underwriting and family expense insurance. The growth in the development of medical insurance is of interest in its adaptability to the insuring of children of all ages and women not employed for monetary compensation. The development of students and campers group insurance has also served to make this type of protection available to an increasing number of young persons.

Despite predictions of greatly increased air travel in the years immediately ahead, accident policies were again broadened, so far as aviation hazards are concerned, to cover passenger airline travel anywhere in the world and to cover passenger travel in private planes within the bounds of North America, all without additional cost to the policyholder. Coverage was further extended to include ground coverage for insured engaged in the aviation industry. The extension of individual accident and health policies to members of the Armed Forces within the continental United States, without additional premium and despite policy exclusions to the contrary, was continued on the same basis as it had been since the outbreak of the war.

In the latter part of 1946 the task of revising the *Occupational Classifications Manual* was begun, such revision being made necessary by changes in the hazards of industry brought about principally by improved industrial methods developed during the war. New occupations were classified, many were reclassified, occupations now obsolete were omitted. The task was completed in 1947 and the new *Manual* will be ready for distribution early in 1948.

In 1947, a vast body of legislation affecting accident and health insurance was enacted, the purpose of which was to eliminate from the business publicly unconscionable practices and to increase the degree of state regulation. Simultaneously, industry and state officials approached the task of revising the Uniform Standard Provisions law, recommended by the National Association of Insurance Commissioners in 1912, and by the year's end the task had been completed. Of interest from the regulatory viewpoint also is the interest displayed by several states in those accident and health policies producing abnormally low loss ratios.

Of additional importance during 1947 were efforts on the part of the industry to satisfy public demands, expressed in part by legislation being introduced into many state legislatures and the Congress, for health insurance coverage spread over a larger segment of the population. Studies were made, the purpose of which was to give a clearer and more accurate picture of the degree of coverage already in force. Studies were also made of the problems surrounding the granting of coverage to a larger portion of the rural population. Insurers also established points of cooperation with the medical profession with a view to writing minimum medical, surgical, and hospital costs coverages, all to the end of supplying basic protection to a larger proportion of the population.

SURETY BONDS

Contrary trends manifested themselves during 1947 in fidelity and surety lines. While volume generally was moderately good there were deviations from the pattern of progress. Losses under blanket bonds for financial institutions increased during the year, while premium volume, largely because of rate reductions over the past several years, was off. Accentuating this decline in volume was the comparatively small number of new financial institutions which began business in 1947, and although many institutions increased their bond amounts, new premiums failed to make up the differential.

Fidelity bond volume also was affected in similar degree by rate reductions over the past several years and by the three-year premium rule which was inaugurated two years ago. A large number of new, if small, blanket fidelity bonds, however, were written in 1947. Blanket bonds also were written extensively to supplant schedule bonds, thereby providing greater protection for assureds.

The Towner Rating Bureau made available in September 1947, a complete revision of its fidelity and blanket fidelity sections of the manual. They have been consolidated into a single section which enables manual holders to readily determine the correct rate and classification. The balance of the manual is in the course of revision.

Surety volume, on the other hand, gave promise of reaching a higher level. While the contracting business did not fully emerge during the year from wartime urgencies and restrictions, there was more bonded building construction in 1947 than in the preceding year. Highway construction programs showed signs of acceleration, and multiple housing developments mushroomed, with many more in the blueprint stage.

High construction costs, however, had an adverse effect in many instances. A number of large contracts, in which competitive bids were received, were not awarded because of the wide difference between the dollar amounts appropriated for completion of the work and the estimates of the lowest bidders. Many such estimates so far exceeded appropriations that too frequently all bids were rejected and the building programs were postponed indefinitely.

Costs of material and labor were unduly high in 1947, but if there is a leveling off of the price range the broad construction program, which got off to a fair start in the past year, may be broadly activated in the forthcoming years.

The number of bonds written on private construction projects was not inordinately large, but there were many substantial contracts bonded. However, the new private construction performance and payment bond forms are but one year old, and an immediate expansion of bond business through the use of these forms was not generally anticipated. At the same time, private owners are learning of the value of these bonds from their brokers, agents and architects. When restrictions on building materials for private construction are lifted all along the line and with a more plentiful stockpile of available material, a substantial bond volume in this field can be expected.

While underwriting results in 1947 were favorable, it is well known to the students of the business that fidelity and surety experience can not be measured by the experience of a single year but requires a sufficiently large enough cycle so as to embrace periods of low and high loss ratios.

AVIATION LIABILITY INSURANCE

The continued introduction of new type high-speed aircraft, with their large passenger capacity, by the scheduled airlines resulted in severe losses which were reflected in an unsatisfactory experience by the aviation underwriters. Non-scheduled airlines also experienced an unsatisfactory loss ratio. This, coupled with more aggressive participation by non-admitted insurers and increased cost of claim settlements, has taxed the ingenuity and caution of the domestic underwriters.

In the personal plane field, broader coverages were introduced, and rates continued to go down during the first half of the year. Because of the frequency of accidents and inflated claim costs, however, a substantial increase in rates was dictated, but enough time has not elapsed to determine whether this increase will be sufficient. Aircraft production in the small personal plane field is going through a period of transition from the two-place type to the larger four-place type. Although this has resulted in a reduction in the number of units manufactured, there has been an increase in premium income because of the increase in rates and the larger passenger capacity per aircraft.

The unfavorable experience in aviation insurance has resulted in the withdrawal of some companies which entered the field after the war. One of the oldest groups has discontinued its underwriting activities as a group. Some of the member companies of this group contemplate entering the field on an independent basis, while others have announced their association with the remaining aviation groups.

As experience is gained with the new equipment that has been in use, though still newer equipment is yet to be placed in service by the scheduled airlines in 1948, it is hoped that the 1947 experience of the underwriters will be improved upon, but it is apparent from the size of the equipment now being used in commercial aviation that the cost of an airline crash is going to be expensive.

NET PREMIUMS WRITTEN

(By kind or type of insurance, by all U. S. casualty companies, including state funds, in the calendar years 1943–1946)

Kind of Insurance	Net Premiums Written in Calendar Years			
	1943	1944	1945	1946
1. Workmen's Compensation	$650,417,182	$641,518,082	$613,693,798	$638,601,261
2. Automobile Bodily Injury	284,627,763	320,079,518	365,142,136	511,448,483

DIVISION XI

AGRICULTURE AND ALLIED INDUSTRIES

CONDITIONS IN AGRICULTURE

By Arthur P. Chew
Information Specialist, Department of Agriculture

GENERAL

Production of food on United States farms in 1947 was a new high record. Tremendous crops of the food grains were more than sufficient to offset a reduced output of vegetables caused by an unfavorable spring. The corn crop was short; but the effect of that was not felt at once. It will be more evident in 1948, when tight feed supplies will curtail livestock production. Mounting foreign production of some food items contributed to the United States food supply. Our imports of certain agricultural products, notably sugar and bananas, were larger in 1947 than in any year since the beginning of the Second World War.

Food supplies for domestic consumption in the United States were about as large in 1947 as the previous record total of 1946, and were distributed more evenly throughout the year. Consumption per person was about 17 per cent above the pre-war (1935-39) average. Food prices at retail fluctuated considerably but became significantly higher in the later months. The demand for foods was exceptionally strong both at home and abroad. About the same proportion of the total food supplies went into domestic consumption as in 1946. Our sustained high production permitted heavy shipments to occupied areas and to our former allies.

The consumption of individual foods per capita differed somewhat from that of 1946. It was lower in chicken and turkey, fluid milk and cream, canned fruits and fruit juices, fresh vegetables, dried beans, and canned soups. There were some increases in the consumption of sugar, meats, eggs, cheese, evaporated milk, butter, lard, margarine, rice, and fresh fruits. Some foods continued to be in smaller supply on a per capita basis than before the war, but in most cases even these were more plentiful for United States consumption than in other years since the pre-war period 1935-39. This group of foods included butter, canned fish, and sugar.

In nutritive value the food supply available to United States consumers in 1947 was substantially higher than before the war.

GRAIN PRODUCTION

Farmers met with unusual obstacles in an extremely adverse spring. Corn was the chief crop which could not overcome the early adversities. The outturn of corn, slightly above that of 1940, was otherwise the smallest since 1936. With barley and sorghum grain also below the average, the tonnage of feed grains was relatively small. The carry-over from previous seasons was fairly large. Partly because livestock numbers on farms decreased, the supply per animal unit was only about 10 per cent below the average of the previous 10 years, though higher than in most years prior to 1937. Hay was a larger-than-average crop and the carry-over was large. Hence the supply of hay per animal unit was the most liberal of record, though much of it was of poor quality.

Output of crops in the United States in 1947 was near the average of the 1942-46 period, the best five years in the country's history. It was only about 5 per cent less than the record set in 1946, on the basis of preliminary estimates. Although corn production was relatively small and held down the feed-grain total, food grains were produced in record volume. Hay, oilseed, fruits, sugar crops, tobacco, and truck crops ranged from above average to near record in volume. Only a few crops, in addition to corn, were below average to near record in volume. Only a few crops, in addition to corn, were below average. Livestock products reached a relatively high level, much above that of any prewar year, though less than that of any of the last five years.

The season was favorable for winter wheat, and for the first time the country harvested more than 1,000,000,000 bushels. Augmented by a relatively large spring wheat crop grown despite adverse planting conditions, the production of all wheat was about 1,400,000,000 bushels—a new record. Rice reached a new high mark. Rye production was one-third larger than in 1946, though only two-thirds of the average. Buckwheat production was well above average. As mentioned, total food-grain tonnage was the largest of record.

COTTON AND OTHER CROPS

Oilseed production included relatively large outturns of soybeans and peanuts, the third largest flaxseed crop on record, and production of cottonseed one-third above 1946 though below the average. Altogether, the oilseed crop yielded a tonnage about 11 per cent above that of 1946 and one-fifth above the average.

Cotton acreage was about one-sixth larger than in 1946, and yields were better than average; production was more than one-third larger than in 1946 and nearly up to average.

RECORD CROPS

Record crops included wheat, rice, pears, and sugar beets. Outturns of flaxseed, soybeans, hay, buckwheat, tobacco, peanuts, sugar beets, peaches, grapes, citrus fruits, and truck crops were relatively heavy. Production of oats, potatoes, beans, peas, and apples was above average. Production was below the average in barley, rye, and cotton though these crops were well above the production of 1946. Production of corn, sorghum grain, sweet potatoes, sugarcane, and broomcorn was smaller than in 1946.

The August 1 estimate of the combined acreage of all crops for harvest was 347,300,000 acres, slightly (0.5 per cent) more than in 1946. With the exception of 1943 and 1944, this total exceeds that of any other year since 1932. Planted acreages totaled 357,400,000 acres. The loss of 10,100,000 acres was less than that of any other year since 1930 except 1946. Acreage planted fell short of acreage planned, largely because light abandonment of winter wheat provided less acreage than usual for replanting to corn and sorghums. In addition, adverse weather prevented farmers from planting intended acreage of oats and corn.

Crops for which goals had been set fell below goals by a total of 10,400,000 acres, or 3 per cent. Plantings of wheat, rice, dry peas, and peanuts exceeded the goals, in each case by a relatively wide margin, but corn, oats, barley, rye for harvest, flaxseed, sorghums, potatoes, sweet potatoes, soybeans for beans, sugar beets, and dry beans were far below the goals. Tobacco, sugarcane, and all hay for harvest were below the goals in a lesser degree.

FRUIT PRODUCTION

Deciduous fruit production, according to preliminary estimates, was about 6 per cent less than the 1946 record. Apple production was about average; peaches and grapes were slightly smaller crops than 1946 records; pears were a record. Prospects for the new citrus crop were favorable in all areas except Arizona, where hot dry weather caused much damage. This crop in 1946-47, set a high record. Truck crops for fresh market and for processing were well above average though below the record tonnages of 1946.

LIVESTOCK AND DAIRY PRODUCTS

Production of livestock and livestock products was about 2 per cent less than that of 1946, about 6 per cent less than that of 1945 and that of 1944, and 10 per cent less than the peak production of 1943. Most of the decline was in meat animals and in wool and mohair. Output of dairy and poultry products was nearly at the 1946 level. Estimated at 42,000,000 pounds liveweight, the production of cattle, hogs, sheep, and poultry was about 1,700,000 pounds less than that of 1946, about 9,600,000 pounds less than the 1943 record, but greater than in any year prior to 1942.

The number of hens on farms had been steadily declining since the peak year 1944; it seemed likely, as 1947 drew to a close, that production of eggs would be only about 2 per cent less than in 1946 and 7 per cent less than in 1944. Egg production was well above that of any year previous to 1946. Total milk production was only about 1 per cent less than in 1946 and 2 per cent less than in 1945. Production per cow, at a record level throughout most of the year, was high enough nearly to offset the smallest number of cows milked.

FOOD SCARCITY ABROAD

The food outlook for 1947-48 in many parts of the world was more serious than in either of the previous two seasons. Delayed spring planting and summer drought caused serious reduction in the United States corn crop which more than offset the increase in the wheat crop. The 1947 wheat production in the principal importing countries was considerably smaller than in 1946. The deficit in western European countries alone was expected to total over 200,000,000 bushels. In addition, western Europe had a very dry summer which greatly reduced the production of hay, potatoes, and other root crops and dried up pastures. Sharp reduction occurred in the output of dairy products, and there was some liquidation of livestock.

Production of cereals in the Soviet Union and other eastern European countries in 1947 was somewhat larger than in 1946 and seemed likely to permit some exports.

Crops in the Far East indicated a slight improvement for the coming year though price production in the surplus-producing countries was still far below pre-war and exportable supplies were only about one-third of the pre-war average. In consequence, the Far East required large imports of bread grains.

In the Far East food supplies were still very low in early 1947 though a rice crop larger than that of the previous year had been harvested. Supplies of rice available for export were only about one-fourth the pre-war average. This meant that the rice-deficit countries in the Far East would have to continue obtaining their food imports from the United States and other food-surplus countries outside the Orient.

Prospects for consumption levels in continental Europe in 1947-48 depend largely upon imports. In the 1946-47 season, food production for the Continent as a whole rose to between 85 and 90 per cent of the pre-war average. Supplies of domestic origin were supplemented by large imports which included some 12,000,000 short tons of grain for food, more than 500,000 short tons of fat for food (including oil equivalent of oilseed), about 200,000 short tons of sugar, and some dairy products, meat, and pulses.

Food production for 1947-48 is expected to be less than 85 per cent of pre-war volume. The severe winter of 1946-47, followed by a summer drought in much of western Europe, reduced 1947 grain production much below that of the previous year, curtailed the output of milk, and threatened the potato, sugarbeet, and fall fodder crops. Some countries expected to increase the food use of domestically grown grain at the expense of feed. Temporarily, abnormally heavy slaughtering may increase the meat output, but such increases can not offset the reduced output of food crops and dairy products in western Europe.

Probably the farm population will continue to eat at near the 1946 level; hence the decline in supplies for the non-farm population, unless imports increase, will be greater than the decline in production.

AMERICAN FOOD EXPORTS

This nation exported more than 19,000,000 long tons of grain and other food in the year ended June 30, 1947, mostly to countries left hungry by the war and its aftermath. That was more food than any country had ever before shipped abroad in a single year; more than the United States itself exported in the immediately preceding record food export year.

Our exports, plus those of other food-surplus countries, did not, however, fully meet the needs of war-devastated countries. Millions of people in both Europe and Asia still were hungry and looking to the food-surplus countries for continued food relief. Accordingly, the President asked the Cabinet Committee, that he had appointed on World Food Programs, to carry on in 1947-48 with the continued help of the Coordinator of Emergency Export Program.

In the 1946-47 marketing season the zones occupied by American and British military forces in Europe received 3,210,268 long tons of United States food. The United Kingdom received 1,700,446 tons; Italy, 1,464,286 tons; France and French North Africa, 830,357 tons. All other European countries combined received 4,491,517 tons. Exports to the Far East provided 1,708,482 long tons of American food for Japan and Korea under the American military feeding program. Exports to India totaled 1,027,232 tons; to the Philippines, China, and Netherlands East Indies 1,030,357 tons. Latin-American republics received 2,050,000 tons, and other countries 1,671,875.

Food grain was the backbone of the export program. Easily shipped and stored, and high in food value, food grain was of supreme importance in the world food crisis. Altogether the grains, including rice, provided slightly more than 15,000,000 tons of the total shipments. Of this total, wheat and flour, calculated as wheat equivalent, accounted for 10,600,000 tons. Corn, oats, barley, rye, and grain sorghums accounted for slightly more than 4,000,000 tons; rice for 500,000 tons. Other shipments included 501,786 tons of dairy products, 213,839 tons of fats and oils, 231,696 tons of meat, and nearly 3,000,000 tons of other foods such as dry beans and peas, eggs, fish, sugar, potatoes, vegetables, fruits, and nuts.

PROSPECTIVE REQUIREMENTS

World relief needs will continue in 1948, but to maintain record grain shipments in the face of greatly reduced supplies of feed grains it will be necessary for the United States to conserve grain in every way possible. This underlines the need for war-stricken countries to increase their own farm production. Our help to them for this purpose has been substantial and will continue. For example, the United States Army in 1947 (calendar year) is supplied fertilizer material containing about 143,000 long tons of nitrogen to the occupied zones of Europe, produced in plants under Army jurisdiction. Nitrogenous fertilizer has gone to other devastated areas, in line with recommendations by the International Emergency Food Council. Exports of farm machinery will increase. Ultimately, this country in farm as well as non-farm business will prosper more surely from restored self-help abroad than from abnormal requirements for relief.

In the fall of 1945 the world estimated a pressing need for about 35,000,000 tons of grain exports. Exportable supplies in sight amounted to only about 25,000,000 tons. By

July 1946, the United States had gathered together and exported 11,747,000 long tons of grain. It had to reduce its production of livestock products, reduce its own consumption of cereals, offer special incentives to the farmers, and deplete its reserve stocks of wheat to the lowest level in two decades—about 100,000,000 bushels. Other exporting countries sharply reduced their supplies. Accordingly, the world entered the 1946-47 crop year with very little grain in reserve. Excellent United States grain crops in 1946, with prospects at the year end that the 1947 wheat crop would be large, enabled the United States to lift its export goal for 1946-47 beyond the expectations, but increased shipments again brought carryover stocks to a very low level.

LIMITATIONS OF U. S. HELP

Against this background United States officials sketched the export prospects. Low carry-over stocks of wheat had a big offset in another record United States wheat crop. Even after allowing for an increase in carry-over stocks to a safer level, it seemed we might still be able to export more wheat than we exported in 1946-47. The wheat export possibility for 1947-48 remained, however, subject to the reduced production for other grains, especially corn. Total grain output of the United States in 1947 was smaller than that of 1946. These facts about the United States position, along with comparable facts from other grain-exporting countries, indicated clearly that avoidance of a third year of intense crisis and suffering in the grain-importing countries would necessitate careful management of rations, along with increased production and collection of grain from their own farms.

The problem of developing production to meet long-term world needs looms larger. World population is increasing by 15,000,000 to 20,000,000 each year, and in the United States and other high-producing countries demand is at a peak that corresponds with employment and wages. People want more and better food than before the war. On the other hand, despite the current pressure on supplies, the prospect of economic surpluses worries producers. Shortage of international exchange in needy countries may inhibit exports and imports, and the recovery of farm production in war-damaged areas that formerly satisfied their own needs will eventually reduce the import demand. In non-food products, the synthetics and other man-made materials disturb old patterns of production, as in the case of rubber and silk, and millions of small producers may find themselves without a livelihood.

RESPONSE THROUGH FAO AND OTHER AGENCIES

The situation is far too complex and difficult for individual nations to attempt to deal with it by themselves; indeed, unilateral action for the benefit of one country may adversely affect other countries and, by increasing international tensions and difficulties, may recoil on the initiator. Economic action is necessary in which the Food and Agricultural Organization, the International Bank, the Monetary Fund, the proposed International Trade Organization, and other appropriate agencies will all play a part and complement one another.

The Food and Agriculture Organization, under the leadership of Sir John Boyd Orr, has been addressing itself to such problems. Chief effort at the moment centers in equipping the organization to deal more effectively with the vast problems it was set up to handle. The Preparatory Commission on World Food Proposals, headed by Lord Bruce and including delegates from 17 countries and observers from many others, met in Washington for three months (October 1946-January 1947) and drew up recommendations primarily—

(1) To establish a Council of FAO (or World Food Council), consisting of official representatives of 18 nations, which would meet at suitable

intervals between the annual sessions of the FAO Conference, keep the world situation under continuous review, and apply policies set by the Conference to current problems; and

(2) To turn the Conference of FAO into a full-scale review of the world situation and outlook in food, agriculture, forestry, and fisheries, at which national programs and plans would be examined annually and mutual adjustments worked out to fit world production more closely to world needs and to reduce economic conflict between nations.

The United States Government proposed amendments to the FAO constitution which would put the Preparatory Commission's recommendations into effect.

In effect, the Preparatory Commission proposals are a modified version of those made by Sir John Orr in 1946. Whereas Sir John had suggested the setting up of a World Food Board with funds and authority to establish world stocks of major agricultural commodities and mitigate violent price fluctuations by direct buying and selling, the new proposals would leave actual operations in the hands of governments.

Agricultural missions from the United States have visited countries of the Western Hemisphere, of the Middle East, and of the Far East. Sent in every case by invitation, the missions have consulted with the foreign agricultural authorities, made agricultural tours and surveys, recommended research projects, suggested lines of action for agricultural improvement, and in some cases offered programs for necessary administrative organization and procedure. Also, the missions have indicated ways in which the governments of the countries visited might collaborate more or less permanently with the Government of the United States, and have suggested what projects, personnel, facilities, and organizations would help. Some missions have suggested action programs to cope with emergencies. Usually the missions have drawn on trained agricultural personnel from state agencies and from private industry as well as from the Federal agencies.

AGRICULTURAL MISSIONS TO FOREIGN COUNTRIES

Altogether, over a number of years, 17 agricultural missions from the United States have visited American countries. They have completed surveys in Bolivia, Colombia, Ecuador, Haiti, Mexico, Nicaragua, Paraguay, Peru, and Venezuela. Missions are now in Colombia and Panama. After the Second World War, this country sent an agricultural mission to the Middle East. It visited Egypt, Lebanon, Iraq, and Saudi Arabia, and drew up recommendations in cooperation with local experts and authorities. Chiefly, the recommendations looked toward the improvement of agricultural practices, the provision of more healthful diets to low-income groups, and the raising of living standards in general.

Similar missions visited China and the Philippines. Jointly with members appointed by the host governments, both studied long-range as well as immediate agricultural problems and made recommendations for a comprehensive national agricultural program and the services required to implement it, keyed to practical possibilities. Besides the mission, some individual technicians from the United States visited China by invitation of the Chinese authorities and studied special problems, for example, the problem of designing the proposed gigantic Ichang Dam and power plant on the Yangtze River.

Conversely, the United States has invited foreign agricultural scientists, economists, and other technicians to study problems of production, marketing, and so forth in the United States. There is a double benefit. The visitors often throw a fresh light on American problems and simultaneously they learn from us. Such cooperation among the United States, the United Kingdom, France, and The Netherlands brought a wide range of knowledge and experience to bear on agricultural problems in the Caribbean area. The Bureau of Reclamation accepted sponsored visitors who wished to study irrigation; it also accepted some foreign engineers for in-service training. Training programs for foreign students of agricultural science and economics have been under way in the United States for several years under the direction of the Office of Foreign Agricultural Relations in cooperation with other governmental agencies both Federal and state and in cooperation also with foundations and private institutions.

Our agricultural cooperation with other countries includes an important program started in 1942 by the Institute of Inter-American Affairs. This agency is a corporation of the United States Government, founded especially to assist other American republics in alleviating agricultural hardships caused by the war. In each country aided it established a special Inter-American Cooperative Service, financed and also staffed by the United States Government and the host government. The two governments adopted cooperative programs and administered them jointly, usually under the direction of the chief United States technician. Projects have been completed in land utilization, livestock and pasture management, food storage and distribution, home improvement and nutrition, and training and education. The countries aided include Brazil, Paraguay, Peru, Venezuela, Costa Rica, El Salvador, Haiti, Honduras, and Panama.

FOOD CONSUMPTION IN THE UNITED STATES

Since 1940, civilians in the United States have eaten more and better food than before the Second World War, though this country has sent enormous quantities of food abroad, and has experienced shortages of manpower and of farm machinery and other agricultural supplies. In 1944, when the war effort was at its peak, civilian consumption in the United States, though about 10 per cent above the pre-war average, accounted for only about 80 per cent of the food disappearance. The remainder went in the proportion of about 12.7 per cent to the United States military forces and 7.7 per cent in lend lease and other exports. This was possible because the food output was about one-third above the pre-war level. Food supplies of civilians in the United States are continuing at the high level reached in 1946; they will probably hold there into 1948, even with food shipments abroad maintained at a high rate.

Average supplies of most nutrients for United States civilians should be almost as high throughout 1948 as they were in 1946. Possibly the per capita consumption of fluid milk and cream will decline a little, with some small resulting decrease in calcium and riboflavin. Supplies of carbohydrates will be slightly larger, especially in the form of sugar. Supplies of thiamine, riboflavin, niacin, and iron will remain high as a result in part of the continued enrichment of grain products with these nutrients. It is not yet possible to forecast 1948 supplies of vitamins A and C, since these depend considerably on the production of fruits and vegetables, but we know that since 1935-39 the consumption of leafy, green, and yellow vegetables, and of citrus fruit and whole milk, has increased substantially. There is no reason to suppose it will fall off.

Yet nutrition can not be gauged exclusively from data on nutrients available. Such data are national averages, subject to very unequal distribution. Supplies adequate enough, when viewed as averages, do not prove that everyone has enough to eat. Satisfactory averages give no assurance that all groups, in all sections of the country, at all income levels, and at all seasons, can have good diets. Probably the distribution of the food supply was more even during than before the war. In the war years, unemployment was absent and price controls, rationing, and other controls were in effect. It may be less even now. Nationwide data for various groups within the population are wanting, but reduced evenness in distribution is to be expected from the termination of rationing and from the removal of price-controls, with resulting rise in living costs.

The nutritive value of the United States food supply from 1935 to 1945 rose from the low levels characteristic of a depression period to the high levels characteristic of full production and relatively higher consumer purchasing power. Nevertheless, even in 1945 some of the nation's families had less of various nutrients than the average which the aggregate food supply would afford. How far below the average some families were is shown in studies made in two states in the summer of 1945.

In one of the low-income counties studied, half of the families had diets rated unsatisfactory. Their diets furnished less than two-thirds of the recommended allowances of the National Research Council for calories and for eight specified nutrients. Calcium, vitamin A, and ascorbic acid content of the diets of the Negro farm families studied was 125 per cent of the recommended allowance, yet 43 per cent of these families failed to get as much as the allowance, even in the summer months. In fact, in this sample of families, about twice the recommended allowance as a group average for a nutrient appeared necessary to insure that practically every family would be getting at least the allowance. When the average value for most nutrients was about 150 per cent of the recommended allowance, almost every family diet contained at least ⅔ of the allowance.

It has been proposed that in planning the distribution of world food supplies a margin of 15 per cent be allowed to cover maldistribution. These data on dietary levels of Negro families suggest that this might be insufficient. At the level of 115 per cent of the average, 40 per cent or more of the diets were unsatisfactory in the various dietary factors.

U. S. WHEAT IN THE WORLD FOOD SITUATION

Carry-over stocks of wheat in the United States declined to a low level —83,000,000 bushels on July 1, 1947, but the tremendous 1947 wheat crop made this not dangerous. In fact it was possible in late 1946 to drop restrictions on the domestic use of wheat. A War Food Order, effective March 1, 1946, which required 80 per cent extraction of wheat flour as compared with the normal rate of about 72 per cent, became inoperative Sept. 1, 1946. Shortly afterward the Department of Agriculture suspended limitations on the quantity of flour and wheat food produced for domestic distribution. Such limitations had been in effect since April 1, 1946.

Significant changes occurred during 1946-47 in the exportation of wheat and flour. The most important were discontinuance of UNRRA and an increase in shipments of wheat, including flour, to the occupation zones. Exports of wheat and flour by UNRRA in the marketing year totaled 56,000,000 bushels or 35 per cent less than in the preceding year. On the other hand shipments by the military authorities for civilian relief overseas (including United Kingdom Zone, Germany) totaled about 119,000,000 bushels or an increase of about 42 per cent. Exports to "paying countries" were about 222,000,000 bushels, about the same as in 1945-46. When active UNRRA operations supported by donations from member nations ceased May 31, 1947, the task of supplying deficit countries fell increasingly upon the United States.

Wheat prices to United States growers for the 1947 crop have been about those of 1946-7, when they averaged $1.91, the highest since the 1919 average of $2.16. Accordingly, growers expected to seed about as much land to wheat for the 1948 crop as they did for that of 1947. With the foreign demand larger, another large United States crop is desirable. Prices in 1948 with just average yields should again be above the support levels. Above-average yields on the expected large acreage might put some pressure on the price supports. Price support at 90 per cent of parity will apply to the 1948 crop until Dec. 31. Thereafter support at that level will give place to other arrangements. Existing law provides for loans beyond 1948 at from 52 to 75 per cent of parity.

FAVORABLE POSITION OF COTTON

The favorable position of cotton is a result largely of the war and its aftermath, and it poses problems which may become pressing within a very few years. Cotton is responding now to certain influences of an obviously temporary character. Export demand, for example, has been strengthened in the last two years by the wartime depletion of cotton stocks in many cotton-manufacturing countries. Simultaneously, the United States demand for raw cotton is very high.

Among the causes are the wartime and early post-war reduction of cotton textile inventories, the high level of American buying power, large exports of cotton textiles to meet war-created shortages abroad, and the continuing general scarcity of other goods that otherwise would compete vigorously for the consumer's dollar. Thus, durable goods such as housing are difficult to get. Moreover, some factors on the supply side tend to keep production of American cotton from catching up with disappearance. Labor is relatively scarce and expensive in the cotton fields; moreover, other farm enterprises have been giving favorable returns. In consequence the acreage in cotton has been exceptionally small, and the domestic disappearance (consumption and exports) has greatly exceeded production during the past two seasons.

Two of the smallest United States crops in 50 years, in combination with some recovery in exports and a continued high domestic consumption, reduced the domestic carry-over by 8,600,000 bales in the two years ended July 1947. Cotton textile mills in the United States used more cotton in the 1946-47 season than in any other peacetime year; they used 45 per cent more than the 1935-39 average. Need for cotton goods throughout the world was almost as urgent as the need for foods, and exports of domestic textiles increased to record levels, thus contributing to the high consumption. Also, the government continued, up to Feb. 13, 1947, to make export payments on raw cotton at the rate of 4 cents a pound, and at lower rates since that date. It took other steps to dispose of American cotton in foreign countries, among them Germany and Japan. Cotton benefited as well from the fact that the production of synthetic fibers in foreign countries was much below the level of the early war years.

THE TOBACCO PROBLEM

Production of tobacco in the United States in 1947 may run a little above 2,000,000,000 pounds. It will be smaller than the record crop of 1946, but well above the pre-war average. Consumption in the United States continues far above the pre-war level. Output of cigarettes in the year ended June 30, 1947 was about 360,000,000,000, as compared with 332,000,000,000 in the preceding 12 months and an annual average of 169,000,000,000 before the war. Cigarette consumption reached its new high despite an increase in prices; the number of cigarette smokers increased, and also the consumption per person. Cigar consumption was moderately higher than in 1945-46 and higher than in pre-war years, though toward the end of the fiscal year it declined. Consumption of chewing and pipe tobacco declined during most of the year and was well below the pre-war and war years. Snuff consumption fell below the level of 1945-46 but remained higher than before the war.

Naturally, with a progressively restricted export market the prevailing high level of tobacco production causes some uneasiness. Europe, the traditional market for American-grown tobacco, took in pre-war years almost 74 per cent of the unmanufactured tobacco exported from the United States. Its ability to continue taking our tobacco will decisively influence our production. Most of the tobacco produced on American farms in 1947 will be subject to marketing quotas authorized under the Agricultural Adjustment Act of 1938, as amended. Currently, however, the acreage allotments are high, with most growers producing to the authorized limit. With export supplies backing up, it would not be feasible to maintain production at so high a level.

Growers may store their surpluses under government non-recourse loans, but if tobacco continues to pile up in excess of domestic requirements, the benefit of that operation can be only temporary. In that event the tobacco growers must have either a larger market, a smaller production, or some combination of the two. The best solution is a larger market, but that means chiefly a larger export market, because our tobacco crops for several years now have greatly exceeded the domestic disappearance, though that is growing.

DAIRY PRODUCTION AND DAIRY INCOME

Besides meeting an increased domestic consumer demand and providing for all United States military requirements, our milk production near the wartime peak of 121,000,000,000 pounds provided also for a considerable export movement. Shipments of dairy products to foreign countries were the equivalent of 3,500,000,000 pounds of milk. They went to occupied and other areas for relief purposes. Production was also sufficient to restore stocks of cheese, evaporated milk, and to some extent butter for domestic distribution. In the United States, civilian consumption of dairy products was about 810 pounds (milk equivalent, butterfat basis). This was nearly 2 per cent above the average of the five war years 1941-45 and about 1 per cent above the pre-war (1935-39) average of 801 pounds. Moreover, continued heavy sale of whole milk from farms permitted an increase in the supply of non-fat milk products for both domestic and export needs.

Cash income from farm sales of milk, cream, and butter in 1947 was about the same as the $4,117,000,000 received by dairymen in 1946 from markets plus dairy production payments. The return from marketings in 1946 was $3,716,000,000 and the return from dairy production payments was $401,000,000. Farm marketings in 1947 were only moderately greater in volume than the 98,600,000,000 pounds of milk (equivalent) sold the previous year. The total income from dairy production was about the same in the two years, despite the elimination of the dairy production payments in mid-1946, because dairy prices were substantially higher during part of 1947 than during the corresponding period of 1946.

LIVESTOCK AND MEATS

The removal in late 1946 of price controls and of most other wartime regulations led to marked readjustments in the livestock industry, in the meat price structure, and in the marketing, processing, and distribution of livestock and meats. Export and import controls affecting livestock and meats continued in 1947. Domestic consumer demand for meats once more operated under competitive conditions, and distribution of livestock products throughout the country tended to return to normal patterns. Demand was much stronger than had been generally expected; it reflected high incomes and purchasing power of consumers. The disposable income per capita in 1947 was more than double that of 1939, and lower income groups received a larger share of the total income than before the war, with the result that these groups competed keenly for consumer goods.

Meat prices at retail rose to a new all-time high, though the available supply of meat per capita was considerably greater than in pre-war years. Prices in 1947 up to August were about 103 per cent above the average of 1937-41, and 72 per cent above the wartime ceiling prices of

1945-46. Livestock prices reached new record levels. Hog prices made the greatest relative advance, rising to nearly four times the 1939-40 level. Cattle prices rose to more than double those of 1939-41, and unusually large numbers of cattle and calves moved to market. Marketings were large in relation to the number of cattle on farms, and the total slaughter of cattle and calves exceeded that of any other year.

READJUSTMENT IN THE POULTRY INDUSTRY

The poultry industry made progress in readjustment of peacetime conditions. In the fiscal year 1947, supplies of poultry products were adequate, except in the short period during which price ceilings were restored under the amended Price Control Act at June 30, 1946 levels. This legislation exempted certain items, among them poultry and eggs and poultry and egg products. Since other livestock products, especially meats, were then scarce, the prices of hens, chickens, turkeys, and eggs rose sharply. On Oct. 15, 1946, administrative orders removed price ceilings from all livestock and livestock products, and thereafter the prices of chickens and turkeys declined considerably; egg prices declined though not to the same extent. By early 1947, prices of turkeys and also of eggs had declined to a level that required price-support programs. Under peacetime conditions the poultry industry, like other branches of agriculture, often has problems of surpluses; poultrymen experienced this aspect of "normality" in 1947.

U. S. POSITION IN FATS AND OILS

As in most branches of agriculture the position of the United States was relatively favorable in fats and oils. Consumption per capita improved over that of 1946. Action by the Department of Agriculture overcame a shortage of drying oils. Production in 1946 was insufficient for domestic needs, and imports of flaxseed for crushing were unobtainable, while linseed oil was available only at a high price and in a very limited quantity. The Department assured United States growers a price of $6 a bushel for flaxseed grown in 1947. The response indicated an adequate supply for the coming year and made our industry independent of foreign supplies. Production of peanuts and likewise of soybeans continued in excess of domestic requirements. Exports of peanuts and soybeans, either as oil or as seed, account for only a small proportion of the output. An output above the domestic need is desirable, however, both to guarantee an adequate domestic supply and to alleviate world needs.

FARM INCOME

Farm income in 1947 was the highest on record. Cash receipts from farm marketings were about $29,700,000,000, 21 per cent above 1946, the previous record year. Government payments, however, totaled only about $350,000,000, less than half of 1946, and total cash receipts, including government payments, may reach $30,000,000,000, 18 per cent over 1946. The difference between the government payments in 1947 and 1946 was due largely to the discontinuance of production-payment programs for dairy products, beef cattle, and sheep on June 30, 1946. In general, the gain in receipts from farm marketings in 1947 was due to a substantial increase in prices, with most of the gain occurring in the first half of the year compared with 1946. Cash receipts from livestock and products are up to about 23 per cent, crops about 19 per cent.

Cash receipts in 1947 were higher than in 1946 for all the important commodity groups except fruit and nuts. Wheat, corn, cotton, hogs, and cattle showed significant gains. Wheat made the greatest percentage increase of any of the major commodities. Relatively high prices were paid for the record wheat crop, and total receipts from wheat seemed likely to be as much as 75 per cent above 1946. Higher prices of corn, plus larger sales the spring of 1947, from the large 1946 crop are more than enough to offset smaller marketings in the latter part of 1947, and total receipts for the year may be about one-third above 1946. Receipts from meat animals increased sharply largely because of higher prices. Cash receipts from hogs and cattle were up about 40 per cent and 35 per cent, respectively.

Production expenses in 1947 are about 16 per cent above 1946, when they amounted to slightly over $14,000,000,000. This was the largest percentage gain over the previous year since 1942. Increasing prices for nearly all commodities and services used in farm production were the principal reason for higher total costs.

COTTON, GRAIN, AND OTHER FIELD CROPS

By Paul L. Koenig
Vice Chairman, Crop Reporting Board, Department of Agriculture

GENERAL

All-crop production in 1947 was only slightly below the average of the best five years in the nation's history. Only in 1942, 1944, and 1946 was the all-crop outturn larger. The corn crop was disappointingly small, but the generally high level of production of most other crops, particularly food and oil crops, held the volume up. The aggregate volume of all crops was 120 per cent of the 1923-32 average used as a base, 6 points below the record set in 1946, but less than 2 points below the 1942-46 average. The highest indexes before 1942 were 112 in 1937 and 110 in 1941.

The total harvested acreage for 52 important crops was 348,355,000 acres, one per cent more than in 1946. With the exception of 1944, this acreage is the largest since the 1928-32 period when totals ranged from 351,000,000 to 362,000,000 acres. Yields per acre for many crops were above average, although below the high level of 1946, and only a few were below average. As a result the composite yield of all crops was 129 per cent of the 1923-32 average, compared with 134 in 1946 and the peak of 136 set in 1942.

The 1947 production of four food grains is the largest of record, totaling about 43,636,000 tons. Contributing to this were record crops of wheat and rice, an above-average crop of buckwheat, and a rye crop only two-thirds of average. Feed grains totaled about 96,060,000 tons, compared with 124,253,000 tons in 1946. Corn and barley were below average crops, but oats and sorghum grain were above average. Oilseeds totaled nearly 12,400,000 tons in 1947, compared with about 11,200,000 tons in 1946. Soybeans contributed the largest tonnage to this total, but production was less than in 1946. Cottonseed production considerably larger than in 1946, the third largest flaxseed crop, and the largest peanut crop of record helped to swell the total. An abundance of hay—102,500,000 tons—2 per cent more than the ample 1946 crop, was harvested in 1947.

COTTON ACREAGE

The 21,387,000 acres of cotton in cultivation in the United States on July 1, 1947 was 3,197,000 acres or 17.6 per cent more than the 1946 planted acres. Despite this substantial increase over 1946, the 1947 acreage was 12.8 per cent below the 10-year (1936-45) average and was less than half as large as the peak of 45,968,000 acres planted in 1925.

The increase in acreage was general throughout the Cotton Belt. However, nearly two thirds of the total increase occurred in Texas where the 1947 planted acreage was 33 per cent higher than in 1946. Other states for which increases of over 25 per cent were reported are Missouri, Florida, and the three far western states. Acreage in Alabama, Mississippi, and Oklahoma remained about the same as in 1946.

Abandonment of acreage in cultivation on July 1 of 1.1 per cent left 21,148,000 acres for harvest, compared with 17,615,000 acres in 1946. Percentage abandonment was well below the 10-year average of 1.9 per cent (excluding cotton plowed up for AAA compliance) and was less than in any year since the early 1930's. In Alabama, Louisiana, and Texas, percentage abandonment was particularly light, about half of average. Above-average abandonment, however, occurred in Missouri and in New Mexico.

American Egyptian cotton in cultivation on July 1, 1947 was 1,300 acres, again less than half of the previous year's acreage and less than one per cent of the peak of 193,000 acres grown in 1942.

COTTON YIELD

Lint yield in 1947, computed at 265.4 pounds per harvested acre, was 30 pounds above the preceding year and 15 pounds above the 10-year average. It was the fourth highest yield on record being exceeded only by 1937, 1942 and 1944. The California yield was the highest ever recorded except for 1940. Yields in Alabama and New Mexico have been exceeded only twice. The Texas yield was but two pounds lower than the 1937 yield which was the highest since 1912. Louisiana produced almost twice as much cotton per acre in 1947 as the near record low of 1946 but this yield has been exceeded six times in recent years.

COTTON PRODUCTION

The 1947 cotton crop of 11,694,000 bales of 500 pounds gross weight was 3,054,000 bales, or 35.3 per cent, larger than the small production of 1946 but almost 700,000 bales less than the 1936-45 average. Louisiana and Texas more than doubled their 1946 production and all other states except South Carolina, Tennessee, and Arkansas produced as much or more cotton than in 1946. However, the 10-year average production was exceeded only by Texas and the three far western states. Production in California hit a record high of 760,000 bales, 22,000 bales larger than the bumper crop of 1937. In New Mexico and Arizona, the production was exceeded only by 1937 and in Texas production was the highest since 1933 except for 1937.

In Texas, Arkansas, and Louisiana, weather was generally favorable at planting time. In Oklahoma excessive early spring rains held the acreage in check. East of the Mississippi River frequent rains interfered with planting, and periods of unseasonably cool weather prevailed through late June, delaying germination and retarding early growth. Cool weather continued through late July, especially in the Central and Eastern Belts, and the weevil population increased rapidly. During August and early September, however, dry soils and high temperatures checked weevil damage and hastened maturity of the crops in most areas. Heavy weevil damage continued in south Georgia, south Alabama, and the eastern Carolinas. Severe drought and a prolonged period of high temperatures materially reduced earlier production prospects in Arkansas and caused excessive shedding and some premature opening in Texas and Oklahoma. In northwestern Texas, subsoil moisture at the beginning of the season was very favorable, and a record crop was produced even though virtually no rain fell from planting to harvesting. Except in the Carolinas, weather was generally favorable for harvesting the crop.

VALUE OF COTTON PRODUCTION

The combined preliminary value of cotton and cottonseed of $2,234,485,000 is the second highest on record, exceeded by the crop of 1919 by about 5 per cent. The value of the 1947 crop is 34 per cent higher than for the previous year's crop. Of the

[2] Included in state and United States totals. Grown principally in Arizona, New Mexico, and Texas.

combined value $1,829,506,000 is for lint and $404,979,000 is for cottonseed computed at preliminary prices. The average price to Dec. 1 of lint is 31.30 cents per pound, 1.34 cents less than in 1946 but higher than for any other crop since 1919. For the second consecutive year, a new record high has been set for cottonseed prices. The preliminary price of $85.40 per ton for cottonseed is $13.50 above the 1946 price. The value of cotton lint placed under government loan and unredeemed at the end of the crop marketing season is included in the above value at average price. On Aug. 1, 1947, only 5,000 bales, of the 142,000 bales of the 1946 crop placed under loan, had not been redeemed. Prior to Dec. 1, loans had been made on 175,000 bales of the 1947 crop.

WHEAT

Wheat production in 1947 exceeded 1,000,000,000 bushels and established a new record for the fourth consecutive year. Production totaled 1,364,919,000 bushels, 18 per cent more than in 1946. The spring wheat crop was one-fourth larger than average; the winter wheat crop was the largest of record by a wide margin.

Supplies of wheat for the 1947-48 season—about 1,448,592,000 bushels—were exceeded in only two other seasons, 1942-43 and 1943-44. In those seasons the carry-in stocks were over 600,000,000 bushels, whereas only about 83,673,000 bushels were carried over into the current season to bolster the record new production. Disappearance of wheat in the 1946-47 season, nearly 1,170,000,000 bushels, was relatively large and reduced carryover stocks to one of the lowest points of record, but still was not up to the record disappearance in the previous season. Of this total, about 492,300,000 bushels were processed for civilian and military food uses, about 87,500,000 bushels were used for seed, less than 50,000 bushels for industrial uses, about 189,400,000 bushels were fed to livestock and poultry, and 400,300,000 bushels exported. These exports were the largest of record, but it is hoped to exceed them out of the current supply. With food use estimated at 510,000,000 bushels, seed at 88,000,000 bushels, industrial use negligible, and about 250,000,000 bushels to be fed to livestock and poultry, about 600,000,000 bushels will be available for export and carryover.

This was an outstanding year for wheat, especially for winter wheat. Growers planted the largest acreage since 1938 in response to the world demand, favorable prices, ample soil moisture, and excellent planting conditions. Of the 77,947,000 acres planted to wheat, acreage losses were very low, and 74,186,000 acres were harvested, the most for any year of record. Harvest began later than usual because cold, wet weather delayed maturity, and wet fields prevented operation of combines, but when started, harvest progressed rapidly, taxing labor, machinery, and transportation facilities. Much wheat was piled on the ground temporarily and later moved to cover with a minimum of loss.

Nine states had record-breaking wheat crops in 1947, among them such heavy producing states as Kansas, Oklahoma, Texas, and Colorado. Kansas alone produced 21 per cent of the nation's total and was followed in rank by North Dakota, Texas, Oklahoma, Nebraska, Washington, Montana, Colorado, South Dakota, and Ohio. These 10 states accounted for over three-fourths of the total.

Ranking second in value among American crops, wheat in 1947 is valued at $3,288,905,000, compared with $2,203,246,000 in 1946. Value is computed at the preliminary season average price of $2.41 per bushel for the 1947 crop and $1.91 for the 1946 crop. These season average prices represent prices received by farmers for the portion of the crop sold, usually 75 to 85 per cent of the wheat produced. When such prices are applied to total production, the computed values afford a measure of the relative importance of each crop in the agricultural economy.

---

[1] Yield of dry beans and peas is expressed as pounds per acre and production as thousand bags of 100 pounds, each, uncleaned.
[2] The unit of yield and production of hay is tons.
[3] The unit of yield and production of popcorn is pounds of ear corn.

WINTER WHEAT

The 1947 winter wheat crop of 1,067,970,000 bushels is the first to top the billion-bushel mark. This record production resulted from the largest planted and harvested acreages in history and a yield per acre equaling the best. Of the 58,068,000 acres sown, 54,780,000 acres were harvested, with the abandonment of 5.7 per cent, the lowest since 1931. The yield per acre was 19.5 bushels, compared with 18 in 1946 and an average of 16.1 bushels.

Soil moisture and weather conditions in the fall of 1946 were almost ideal for seeding. In only Alabama, Arkansas, Iowa, Washington, and Oregon—was a smaller acreage planted than a year before. Germination and stands were good. Growth was strong and vigorous and, before going into dormancy, excellent pasturage was available for lambs and cattle. Losses from winter killing and wind erosion were lighter than usual, but floods caused abandonment in local areas of Illinois, Iowa, and Missouri. Large volunteer acreages were left for harvest in Kansas, Texas, and Oklahoma. Spring weather was mostly favorable and cool, wet weather resulted in well-filled heads, though delaying harvest. The top-ranking states of Kansas, Texas, Oklahoma, Nebraska, and Colorado produced almost 62 per cent of the total winter wheat crop on about 65 per cent of the total acreage. Their 661,492,000 bushels in 1947 exceeded the 1936-45 average for the entire country. The next states in rank as to production were Washington, Ohio, Indiana, Michigan, and Illinois.

SPRING WHEAT

The spring wheat crop of 296,949,000 bushels, about one-fourth above average, includes 43,983,000 bushels of durum and 252,966,000 bushels of other spring wheat. More durum wheat than in 1946 was harvested in all three durum wheat states, totaling 2,925,000 acres or nearly one-fifth more than in 1946. This acreage was in an area where conditions were fairly favorable, and the yield of 15 bushels exceeded the 14.6 in 1946 and the average of 13.1 bushels. The 16,481,000 acres of other spring wheat was only slightly more than in 1946, the planting difficulties due to the late, wet spring resulting in some shift to durum wheat and flax, which could be sown later. Yields were adversely affected by a late May freeze and summer heat, but the favorable moisture situation carried the crop through to a fairly good yield of 15.3 bushels per acre, slightly above that of 1946 and average. The harvesting season was favorable and abandonment was unusually light.

RYE

An upturn in rye production occurred in 1947, following declines for several years which had brought 1946 production nearly down to the low level of the drought year 1934. The 25,977,000 bushels produced was 38 per cent more than in 1946, but still nearly one-third below the 1936-45 average. Diversion of the planted acreage was 46 per cent of the 1947 total, compared with 53 per cent in 1946. Thus the acreage harvested was larger than 1946 and the yield of 12.8 bushels per acre was also above that of 1946 and the average. Rye was harvested from 2,022,000 acres.

South Dakota regained the lead as the chief rye-producing state, with North Dakota second. Nebraska dropped to third place after leading for two years, as the May freeze and hail storms in July took a heavy toll. More than three-fourths of the nation's rye crop is annually harvested in the North Central States. At the preliminary season average price of $2.43 per bushel, the 1947 rye crop is valued at $63,180,000, compared with $1.92 per bushel and a total of $36,169,000 in 1946.

Stocks of rye in all positions, on July 1, 1947, were only 2,346,000 bushels, slightly above the extremely low level of a year before. Added to the new crop, this results in a supply of 28,323,000 bushels for the 1947-48 season, compared with 21,156,000 bushels for the 1946-47 season, which were augmented by imports of about 1,500,000 bushels. In 1946, about 5,500,000 bushels of rye were used for food, 5,200,000 bushels for feed, 4,700,000 bushels for seed, 4,200,000 for alcohol and spirits, with about 600,000 bushels exported. In the previous season, a record 7,200,000 bushels were exported. With demands for feed increased because of the short corn crop, the quantity for export is likely to be small in this season. Slightly more rye acreage was seeded in the fall of 1947 for 1948 harvest than was sown in the fall of 1946 for 1947 harvest.

RICE

The expanded level which rice production has attained in recent years was exceeded in 1947 when 79,345,000 bushels were harvested, 10 per cent more than the previous record set in 1946. Record acreages were planted and harvested with abandonment negligible. The yield of 47.3 bushels per acre, while higher than in 1946, is not quite up to the average of 47.4 bushels.

Of 1,687,000 acres planted, 6 per cent more than in 1946, only 10,000 acres were abandoned and 1,677,000 acres were harvested. The increase was all in the southern area, for California acreage was curtailed by limited irrigation water for rice. In the southern area, the early season for seeding was favorable, and the crop made a good start. Irrigation water became short in Louisiana, and a tropical storm in September flattened much of the late rice there and in Arkansas. In California, most of the acreage reduction was in low-producing areas. Relatively high yields resulted from a favorable growing and harvesting season, so that production was slightly above that of 1946, the previous record for the state. Production in the southern area was 61,485,000 bushels; in California 17,860,000 bushels.

The 1947 rice crop was sold at an average of $2.71 per bushel, at which price the total production was valued at $215,081,000, compared with $2.25 per bushel and $162,726,000 in 1946.

BUCKWHEAT

A buckwheat crop of 7,334,000 bushels, 3 per cent more than in 1946 and 5 per cent above average, was harvested in 1947. A relatively large acreage was planted to buckwheat, for it is used in many areas as a catch-crop when conditions have been unfavorable for planting earlier-sown crops, as was true in 1947. The 518,000 acres harvested were nearly one-third more than in 1946 and one-fourth above average. The yield was only 14.2 bushels per acre, compared with 18.2 in 1946 and the average of 16.8 bushels. Much of the planting was late, which made the crop susceptible to both the excessive heat which blasted blooms in some areas and the early freezes which killed immature fields in parts of New York, Pennsylvania, Ohio, and Minnesota.

Valuing the crop at the preliminary season average price of $1.97 for the portion sold, 1947 production of buckwheat was worth $14,484,000, compared with $1.48 per bushel and $10,517,000 in 1946.

FEED GRAINS

The relatively small tonnage of feed grains produced in 1947 was a disappointing factor in the agricultural economy. The total of 96,060,000 tons of corn, oats, barley, and sorghum grains is nearly 23 per cent below the record 124,253,000 tons produced in 1946. With the exception of 1939, it is less than in any of the preceding 10 years; however, it is more than in most years prior to 1937. The small total results from below average crops of corn and barley, though oats and sorghum grain were above average.

By far the greater proportion of the total feed grain supply is used for feeding livestock and poultry on farms where grown. Added to that is the quantity sold to other farmers and feeders of livestock and poultry. Thus the proportion reaching commercial users and processors is relatively small, though the demand from this source has increased in recent years. Farmers realize the greater part of the income from the feed grains they produce by way of the livestock they feed these grains to, from sales of dairy and poultry products, meat animals, wool, and other animal products. Bolstered by relatively large carryover stocks of corn and oats, the current feed grain supply on farms provides an average supply per animal unit which, though smaller than in nine of the past 10 years, is larger than in most years prior to 1937. Supplies of hay and roughage are ample and well distributed. As in other years of relatively low feed grain supply, this will be a significant factor in stretching grain supplies and in this will be fortified by relatively large supplies of by-product feeds. Grazing of pastures and crop residues also contributed feed later than usual. It is likely that these factors and the price relationship will tend to hold feeding of wheat to a relatively low level in the 1947-48 season.

CORN

The 1947 corn crop, as the result of adversities from planting to harvest, was the smallest since the drought year 1936. The total of 2,400,952,000 bushels was less than three-fourths as much as produced in 1946 and nearly one-tenth below average. The acreage harvested was the smallest since 1894 and the yield per acre the lowest since 1938. About the usual proportion, 2,153,326,000 bushels or 89 per cent of all corn was harvested for grain, with 6 per cent utilized as silage and 5 per cent as fodder hogged and grazed.

Only 86,168,000 acres were planted to corn, because of unfavorable conditions in the spring, 4 per cent less than in 1946. Of this, 83,981,000 acres were harvested for all purposes, the abandonment being relatively low at about 2.5 per cent. The average yield of 28.6 bushels per acre was eight bushels below that of 1946 and nearly a bushel below average. Hybrids were planted on 71 per cent of the total acreage, on 93 per cent of the Corn Belt acreage. These were a major factor in obtaining production, not only because their superior germination performance under adverse conditions resulted in good stands, but also because farmers could select varieties best suited to the season's widely varying conditions and the length of growing season available. Power machinery enabled farmers to plant swiftly when fields could be worked. Nevertheless the effects of cool, wet, and cloudy weather and floods in the northern corn areas, and cool, dry weather in the southeast, could not be entirely overcome. The net effect was a late-planted crop which faced the hazard of frost damage before maturity.

Mostly favorable weather in July enabled farmers to cultivate fields, and corn made good progress. In the Mississippi Valley, hot, rainless weather continued through most of August, resulting in sharp declines in yield prospects, but rapid development of plants. Some corn was irreparably damaged, some pollinated poorly, resulting in poorly filled ears or barren stalks. Corn moved rapidly to maturity during September, but killing frosts occurred one to two weeks early in northern sections, resulting in some "soft" corn in adjacent parts of Ohio, Indiana, and Michigan. Other areas were not seriously affected, and growing weather continued during October, enabling most of the small crop to mature well and be ready for harvest at about the usual time. But the unfavorable weather had reduced Corn Belt production so that it was only 72 per cent of the total, compared with 79 per cent in 1946. Iowa's crop was only a little over half that of 1946. Record yields were obtained in the southeast, however, and North Carolina had its record crop.

The small 1947 corn crop still was the country's leading crop by a wide margin. Valuing all corn by the average price farmers received for the quantity they sold, $2.35 per bushel, the value was $5,640,283,000 compared with $1.56 per bushel and $5,081,927,000 for the much larger 1946 crop.

Stocks of corn in all positions Oct. 1, 1947 were 285,254,000 bushels, compared with 172,926,000 bushels a year earlier. Total supplies in 1947-48 were thus about 2,439,000,000 bushels, in 1946-47 about 3,124,000,000, in 1945-46 about 2,909,000,000.

OATS

An oats crop about one-fifth less than in either of the two preceding years, but still above average, was produced in 1947. The 1,215,970,000 bushels were harvested from 38,648,000 acres. The 42,501,000 acres planted were 9 per cent less than in 1946. Abandonment and diversion to uses other than grain accounted for 9.1 per cent of the total planted, compared with 7.2 per cent in 1946. The yield of 31.5 bushels per acre was 3.2 bushels less than in 1946 and only slightly above average.

Only 89 per cent of the intended acreage was sown in the North Central region, the main producing area, and only 80 per cent in the North Atlantic region, because of cold, wet weather at seeding time. In the fall-seeding areas the acreage was increased over 1946. Oats could not successfully compete with wheat and flax for acreage in the spring wheat section. The growing season was relatively unfavorable, and disease reduced yields in the north.

The value of the 1947 crop, at the preliminary season average price of $1.03 per bushel, was $1,249,451,000, exceeding the larger 1946 crop at $.81 per bushel and a total of $1,213,755,000. Oats rank fifth in value among 1947 crops.

Stocks of oats in all positions on July 1, 1947 were 276,289,000 bushels, which though less than the 291,712,000 bushels on July 1, 1946, were larger than any other carryover stocks of oats. Adding carryover and new crop, supplies were about 1,492,000,000 bushels for the 1947-48 season, compared with the record 1,790,000,000 bushels for 1946-47.

BARLEY

The downward trend in barley production of the preceding four years was checked in 1947 with a crop of 279,182,000 bushels, 6 per cent more than in 1946, but 3 per cent below average. Not only was the acreage larger, but yields were better than in 1946.

Of 12,030,000 acres sown to barley, 4 per cent more than in 1946, about 10,947,000 acres were harvested. Some barley is sown for hay, particularly in Pacific Coast states. Seeding conditions were adverse in most northern areas, plantings were later, and the growing season less favorable than usual. Nevertheless, the acreage harvested in North Central states was larger than in 1946 and accounted for much of the national increase. In the fall-seeding area ideal seeding weather favored acreage increases, and yields equaled or exceeded those obtained in 1946 in most South Atlantic states. Acreages were also increased in the West, and yields were mostly satisfactory.

At the preliminary season average price of $1.71 per bushel, the 1947 barley crop is worth $476,870,000, compared with $1.36 and $356,657,000 for the 1946 crop.

Stocks of 55,544,000 bushels of barley were carried over from previous crops compared with 58,570,000 bushels on July 1, 1946. Combining these with new production, total supplies were about 335,000,000 bushels in the 1947-48 season, compared with 321,000,000 bushels in the 1946-47 season, both well below the three previous years.

SORGHUM GRAIN

The 95,609,000 bushels of sorghum grain produced in 1947 is the smallest production since 1940, but still is slightly above average. It is 11 per cent less than in 1946. Material expansion of wheat acreage in the Great Plains area, and light abandonment, provided less acreage than usual for replanting to sorghum. Also expansion of cotton acreage in northwestern

Texas reduced the acreage available for sorghum.

Moisture conditions were favorable at planting time, but the weather was hot and dry through the summer and early fall in Great Plains areas. The crop did not deteriorate materially, however. and with favorable conditions before harvest, the yield was better than 1946 and average. The 5,606,000 acres harvested for grain was only five-sixths as large as in 1946 and below average, but this was 48 per cent of the acreage of sorghum for all purposes, a percentage which tends to rise each year as increased proportions of improved combine varieties of sorghum are planted. About 88 per cent of the total production was harvested in Texas, Oklahoma, and Kansas.

In addition to the grain, about 6,070,000 tons of forage and 3,445,000 tons of silage were produced. The acreage harvested for all purposes—grain, silage, forage and sirup—totaled 11,297,000 acres. This was about 2,500,000 acres less than in 1946, with most of the reduction in Texas. Oklahoma, and Kansas.

Sorghum grain, at the preliminary season average price of $1.78 per bushel for the portion sold, was valued at $170,446.000 in 1947, compared with $1.37 and $146,571,000 in 1946.

HAY

Gauged by its value, hay is the fourth crop in importance in our country, following corn, wheat, and cotton. It has ranked as high as second, in 1944. The 1947 hay crop amounted to 102,500,000 tons, nearly 2 per cent more than the ample 1946 crop. This was harvested from 75,291,000 acres, also 2 per cent more than in 1946. Yields both years were 1.36 tons per acre, exceeding the average of 1.30 tons. The season was mostly favorable for hay, aside from late freezes in northern Mountain areas and a dry summer in some Mississippi Valley and southwestern states. In the northeast and southeast, rains interfered with harvest, so that some hay was spoiled, much became coarse and over-mature and was of poor quality.

Of the total production nearly one-third was alfalfa hay, nearly as much was clover and timothy. Of the remainder over 13.000.000 tons were wild hay, nearly 7.000,000 tons lespedeza, about 3,500.000 tons soybean, cowpea and peanut hay, 3,000,000 tons grain hay, and 10,000.000 tons of miscellaneous other kinds. At the season average price of $17.30 per ton received for that sold, the 1947 hay crop was valued at $1.776.272.000, compared with $16.70 and $1,678,505,000 in 1946.

The total hay supply, including a large carryover, totals about 118,500,000 tons, about 10 per cent above average. With fewer livestock on farms. the supply per hay-consuming animal unit was the most liberal of record.

DRY BEANS

Production of 17,164,000 bags (100 pounds) of dry beans in 1947 exceeds that of any year since 1943 and is equivalent to 15,726,000 bags cleaned. About 1,839,000 acres were planted to beans and 1,759,000 acres harvested, each about 8½ per cent more than in 1946. In the west, the season was favorable throughout and yields were good, but in the northeast beans were planted late, also in Michigan, and yields were below 1946. For the whole country the yield was 976 pounds per acre. compared with 981 pounds in 1946 and the average of 889 pounds. At $12.10 per bag the 1947 crop is valued at $190.837.000. compared with $10.60 and $156,550,000 in 1946.

OILSEEDS

Oilseeds totaling nearly 12.400.000 tons were produced in 1947. compared with 11.200.000 tons in 1946 and the average of about 10,200.000 tons. The decrease in soybeans from the high point in 1946 was more than offset by the increase in cottonseed, while the peanut crop was the largest of record and flaxseed the third largest.

Soybeans have been the leading oilseed crop in recent years, outranking cottonseed in tonnage. The 1947 production of 181,362,000 bushels, while 10 per cent below the record 1946 crop of 201,275,000 bushels and the smallest since 1941, is still far above pre-war production and maintains the leading position among oilseeds.

Planted under adverse conditions over most of the soybean area, and delayed until late June or early July, the acreage nevertheless was an eighth larger than in 1946. Dry summer weather lowered yields. But the fall was favorable for maturing and harvesting the beans and the crop was practically all combined by Dec. 1. The yield of 16.3 bushels per acre is the second lowest in a decade, and well below the 20.5 bushels in 1946 or the average of 18.2 bushels. Of the 13,654,000 acres planted to soybeans, 11,125,000 acres or 81 per cent, were harvested for beans, with about 1,372,000 acres cut for hay and 1,157,000 acres used for other purposes.

The 1947 soybean crop, at the preliminary season average price of $3.29 per bushel, is valued at $596,702,000, compared with $2.57 and $516,387,000 for the larger 1946 crop. Stocks of only 5,354,000 bushels remained in all positions on Oct. 1, 1947, which, with new production, provides a supply of less than 187,000,000 bushels for the 1947-48 season. In the 1946-47 season the supply was nearly 206,000,000 bushels, of which over 170,000,000 bushels were processed for oil.

Flaxseed production in 1947 was 39,763,000 bushels, three-fourths more than in 1946. The 4,026,000 acres harvested has been exceeded only twice before, and the yield of 9.9 bushels per acre was the highest since 1915. Planting was delayed by wet weather, but the spring moisture carried the crop through a dry summer to a favorable harvest period.

Peanut production for the sixth consecutive year topped two billion pounds and the 1947 crop set a new high mark at 2,251,640,000 pounds. Some harvesting loss occurred in the Virginia-Carolina and southeastern areas because of fall rains, while yields were held down by dry, hot weather in the southwestern area.

Flaxseed, at an average price of $6.23 per bushel was worth $247,876,000, compared with $4.04 and only $91,183,000 in 1946. Peanuts were valued at 10.2 cents per pound and a total of $229,810,000, compared with 9.1 cents and $185,399,000 in 1946. Cottonseed averaging $85.40 per ton and a total of $404,979,000 exceeds by far the smaller 1946 crop worth $71.90 per ton and a total of $252,674,000. The four oilseeds totaled $1,479,367,000 in value, compared with $1,045,643,000 in 1946.

SEED CROPS

Over 705,600,000 pounds of clean seed were harvested in 1947 from 5,400,000 acres by farmers in the United States. These totals include 24 kinds of legume, grass, and cover crops seeds, and compare with 778,400,000 pounds harvested from 6,700,000 acres in 1946, and with the 1941-45 average of 702,800,000 pounds from 5,700,000 acres harvested. The aggregate farm value of the 24 kinds of seed produced in 1947 was $128,000,000 compared with $157,600,000 in 1946.

The 1947 production of the five major legume-hay seed crops (alfalfa, red clover, alsike clover, sweet clover, and lespedeza), totaling 309,400,000 pounds, was 25 per cent smaller than in 1946 when record crops of alfalfa and red-clover seed were produced. The decrease from 1946 was due entirely to a sharp reduction in acreage harvested. In the winter cover crop group, consisting of vetches, Austrian winter peas, blue lupine, ryegrass, and crimson clover, the 1947 production of 234,600,000 pounds was 5 per cent smaller than the 1946 total of 245,700,000 pounds, but exceeded the 1941-45 average by 15 per cent. In spite of a record crop of lupine and more hairy vetch and Austrian winter peas produced in 1947, the total for this group fell below that of 1946 as a result of smaller crops of other vetches, ryegrass, and crimson clover. Production of the pasture and lawn grasses was sharply larger in 1947 than a year earlier. Timothy-seed production was one-fourth larger, Kentucky-bluegrass production was nearly three times larger, and more bromegrass, crested wheatgrass, redtop, and meadow fescue were produced in 1947 than in 1946. These increases were, however, partly offset by smaller crops of Sudan grass and orchard-grass seed.

The 1947 production of alfalfa seed at 1,699,400 bushels, thresher-run seed, was the second largest crop of record, exceeded only by the record 1946 crop of 1,822,400 bushels. It was 44 per cent larger than the 1936-45 average of 1,179,040 bushels. The 1947 acreage harvested of 1,021,200 acres was 13 per cent smaller than the record of 1,174,200 acres harvested in 1946.

Production of red-clover seed in 1947 was the smallest in five years, and a little more than half as large as the record 1946 crop. The 1947 crop of 1,194,800 bushels compares with 2,141,800 bushels in 1946 and the average of 1,435,290 bushels. The large decrease from 1946 was due entirely to the 47 per cent reduction in acreage, which was offset only in part by the slightly larger yield per acre in 1947. Out of 18 producing states, production in only Kentucky, Kansas, Washington, and Oregon was larger in 1947 than in 1946.

The 1947 crop of alsike-clover seed of only 366,200 bushels was 18 per cent smaller than the 1946 crop of 446.200 bushels, but 14 per cent larger than the average of 320,420 bushels. Production in each of the states, except Oregon and California, was smaller in 1947 than in 1946.

The production of only 564,400 bushels of sweet clover seed in 1947 was the second smallest in 24 years of record. It was 10 per cent smaller than the 1946 production of 628,000 bushels and about one-third smaller than the average of 873,650 bushels. Decreases from 1946 were most marked in South Dakota, Nebraska, and Iowa. Increases were largest for Ohio, Kansas (leading state in 1946 and 1947), and Michigan.

The 1947 production of lespedeza seed, smallest in seven years, was 153,960,000 pounds of thresher-run seed. This is about one-fourth smaller than the 1946 crop of 206,800,000 pounds, but 2 per cent above the average of 151,164,000 pounds. Smaller crops than in 1946 were harvested in all producing states except Illinois, Indiana, Kentucky, and Georgia. Wet weather during November caused some shattering of seed and delayed harvesting.

The 1947 production of timothy seed, at 1,641,400 bushels, was 24 per cent larger than the 1946 crop of 1,319,000 bushels and 10 per cent above the average of 1,487,540 bushels. Larger crops than in 1946 in Iowa, Illinois, Indiana, and Ohio more than offset the smaller crops in Missouri, Minnesota, Wisconsin, and Pennsylvania.

Production of Sudan-grass seed in 1947, of 20,740,000 pounds of clean seed, was the smallest on record (since 1929) except in 1934 when 17,050,000 pounds were produced. The 1947 production was 11 per cent smaller than the 1946 crop of 23,300,000 pounds.

Production of Kentucky bluegrass seed in 1947 was over three times as large as the small 1946 crop, and 73 per cent above average. Of the 4,537,000 bushels (63,518,000 pounds) of cured seed produced in 1947, Iowa accounted for 19.1 per cent; Missouri, 18.8 per cent; Nebraska, 18.2 per cent; Kentucky, 14.8 per cent; Minnesota, 13 per cent, and the Dakotas, Kansas, Wisconsin, and Illinois made up the remaining 16.1 per cent. Production of clean seed, weighing 21 pounds per measured bushel or having a purity of about 85 per cent, was 30,235,000 pounds in 1947, compared with 7,666,000 pounds in 1946, and the 1941-45 average of 18,604,000 pounds.

A record crop of 48,300,000 pounds

SEED CROPS—UNITED STATES

Kind of Seed	Acreage Harvested			Yield per Acre			Production		
	Average 1936–45	1946	1947	Average 1936–45	1946	1947	Average 1936–45	1946	1947
		Acres			Bushels			Bushels—Thresher-run

[1] Yield per acre in pounds and production in thousand pounds.
[2] Short-time average.

of blue-lupine seed was produced in 1947 in Georgia, Alabama, and Florida. Since 1943, when only 5,100,000 pounds were produced, the use of lupines for soil building and winter cover has spread each succeeding year into suitable areas of the deep South. The 1947 crop compares with 38,900,000 in 1946, and with the 1943-45 average of 8,600,000 pounds.

THE DAIRY INDUSTRY

By Gerson G. Levin
Bureau of Agricultural Economics, Department of Agriculture

GENERAL

The year 1947, the first full post-war year that the dairy industry was free of all controls, found it in a substantially different position from pre-war. However, except for prices and income the dairy industry during 1947 was not much different from recent years.

Radical changes of the war years in milk production and utilization were continued into 1947. These were a 15 per cent increase in milk production above pre-war and significant changes in the utilization of the milk supply and in the consumption of dairy products. Among the changes which occurred during the war the most outstanding were: (1) a distinct shift in the methods used by farmers in disposing of milk; (2) sharp increases in the domestic consumption of nonfat solids in milk for food; (3) a shift from a net importer to a net exporter basis.

Average prices received by dairy farmers in 1947 and cash receipts were at record highs. This reflected exceptionally large consumer incomes and the substantial rise in the price level which in part was due to exports of agricultural products. Readjustments occurred during the year among the prices of dairy products; sharp fluctuations occurred, particularly for butter.

The probable future pattern of utilization of the milk supply was becoming fairly evident in 1947 with consumption of butter much lower and fluid milk and cream and whole milk products (canned milk and cheese) remaining substantially higher than in pre-war years. (Estimates for 1947 are partly forecast.)

COW NUMBERS AND MILK OUTPUT

During the last 23 years, milk cow numbers have not kept pace with increases in population. Cow numbers during 1947 were about 12 per cent higher than in 1924. During the same period the population increased about 25 per cent.

In the 23-year period from 1924 through 1947 three declines in cow numbers occurred—one from 1925 through 1929 and another during the drought period 1934-38. Neither of these declines was large. The third decline in cow numbers began in 1944. During that year the all-time high in cow numbers—26,000,000 average—was reached. Since then a decrease of 7 per cent has occurred, and in 1947 the average number was about 24,000,000 head, 2 per cent below the previous year.

Despite the reduction during the last few years in cow numbers, total milk production has changed little. The smaller number of cows has been offset by higher output per cow. In 1947, milk production amounted to about 120,500,000,000 pounds, nearly 1,000,000,000 pounds more than in 1946. Output per cow in 1947 exceeded 5,000 pounds for the first time on record.

Short time factors which accounted for the increases in production per cow during the last three years were large feed supplies, good pastures due to favorable weather, and culling of the lower producers from dairy herds.

In 1947, an additional factor was the improved labor supply which resulted in a larger percentage of cows milked than in recent years. In the long run, improvements in methods of feeding, in breeding, and in better management practices contributed to the upward trend in production per unit.

RECORD PRICES AND INCOME

Dairymen in 1947 received about $4,200,000,000 from sales of milk and dairy products. In addition, the value of milk, cream, and butter consumed on farms during 1947 was equivalent to about $800,000,000. Hence, gross farm income from dairying totaled $5,000,000,000, exceeding the 1946 record by about 20 per cent and trebling that of the pre-war years. Since 1920, except for 1942 and 1943, dairying has been the largest contributor to farmers income.

With total milk production only slightly above 1946, increased prices were largely responsible for the higher cash income in 1947 than a year earlier. Farmers received record high averages of about $4.30 per cwt. of whole milk sold, and 75 cents per pound of butterfat. However, relative to feed costs and returns from alternative enterprises, returns from dairying were not so favorable as in recent years.

In addition to the effects of record high prices, a part of the increase in cash receipts over pre-war years was accounted for by a shift from selling cream skimmed from milk to selling whole milk. The latter provides a cash outlet for the nonfat solids in milk, and in almost all instances affords higher unit returns per unit of milk sold. In 1947, sales of whole milk amounted to almost 71,000,000,000, a figure slightly above 1946, and nearly double the 1935-39 average, in contrast to an increase in milk production of only 15 per cent. On the other hand, sales of cream skimmed from milk declined about 30 per cent. In 1947, such sales were the equivalent of 22,000,000,000 pounds of milk compared with 33,000,000,000 pounds in pre-war years.

The United States Department of Agriculture purchased about 200,000,000 pounds of nonfat dry milk solids (dried skim milk). Consequently, except for nonfat dry milk solids, no price support purchases were necessary. The Steagall Amendment to the Price Stabilization Act provides that, if funds are available, the price of whole milk and butterfat received by farmers shall be supported at not less than 90 per cent of parity through Dec. 31, 1948. Unit returns for both whole milk and butterfat during 1947 exceeded parity by about 18 per cent.

FLUCTUATIONS IN BUTTER PRICES

In making the readjustments to a full peacetime basis, prices of manufactured dairy products fluctuated widely. Many of these fluctuations, particularly in the case of butter which is the largest residual claimant of the milk supply, were owing to the lapse and later the removal of price controls in the second half of 1946. Sharp increases occurred in late 1946. In early 1947, prices declined sharply (February through May), but in late 1947, butter prices again fluctuated widely. Although prices of cheese and evaporated milk also fluctuated more widely than in the years prior to 1941, these fluctuations were not so great as in the case of butter.

Retail prices of dairy products in general were about two to three times above pre-war. Butter averaged about 82 cents per pound, cheese over 60 cents a pound, and evaporated milk was about 13 cents a tall can. Fluid milk prices averaged about 19 cents a quart.

UTILIZATION OF MILK SUPPLY

The 124,000,000,000 pounds of milk produced on farms and in cities and villages were utilized and consumed in a variety of ways. About 3,000,000,000 pounds were used in feeding calves on farms, 12,000,000,000 pounds more were consumed by people living on farms as fluid milk and cream. In addition, about 8,000,000,000 pounds went into farm products. Thus, almost 24,000,000,000 pounds, or approximately one-sixth of the total output, did not enter into commercial channels. The urban population consumed the equivalent of 45,000,000,000 pounds of fluid milk and cream. Total consumption of fluid milk and cream, consumed by both farm and urban, amounted to 57,000,000,000 pounds, or approximately 45 per cent of the total production. In contrast, during pre-war years, only 45,000,000,000 pounds were used in fluid milk and cream.

Utilization of milk in whole milk products (cheese, canned milk, and dried whole milk) was at a record level of about 22,000,000,000 pounds compared with about 12,000,000,000 pounds pre-war. Of this quantity, production of cheese took 13,000,000,000 pounds, and nearly 7,000,000,000 pounds went into production of canned milk. Dried whole milk and other miscellaneous items utilized about 2,000,000,000 pounds. Ice cream production utilized about 7,000,000,000 pounds of milk. The quantity of milk used for production of creamery butter, however, was among the lowest on record and totaled about 27,000,000,000 pounds. During 1946, the year with the lowest utilization, about 24,000,000,000 pounds were used for that purpose. In contrast, creamery butter output in immediate pre-war years utilized about 35,000,000,000 pounds of milk.

The quantity of skim milk used for manufacturing purposes was at a record of 15,000,000,000 pounds. Of this volume, nearly 8,000,000,000 pounds went into the production of nonfat dry milk solids for human consumption. The quantity of skim milk used for nonfood purposes or wasted was about 40,000,000,000 pounds, milk equivalent basis. This was slightly larger than the previous low in 1946, but it was substantially less than in the 1935-39 period when about 50,000,000,000 pounds went into this use.

CHEESE AND CREAMERY BUTTER PRODUCTION

A stronger domestic demand, accompanied by large export requirements, continued to favor the production of dairy items other than butter. Accordingly, the output of whole milk manufactured products, was at or near record levels.

Production of American Cheddar cheese was at a record of 1,050,000,000 pounds, about 30 per cent above 1946 and more than double the 1935-39 average. Output of cheeses other than American types declined moderately but at 275,000,000 pounds was 75 per cent above pre-war. Output of condensed and evaporated milk was somewhat less than in 1946, but at 3,400,000,000 pounds, exceeded pre-war by 70 per cent. Production of dry whole milk declined from its wartime peak in 1945, but at 165,000,000 pounds still exceeded pre-war seven times. Production of nonfat dry milk solids for human consumption was at an all-time high of nearly 700,000,000 pounds. 7 per cent above the previous record in 1945 and more than triple pre-war. On the other hand, total butter output, farm plus nonfarm, in 1947 was about 1,600,000,000 pounds, 10 per cent above the previous low in 1946 and 25 per cent below that of the late thirties. Production of ice cream and sherbets was about 10 per cent below the previous year's all-time high and substantially above any other year.

EXPORTS OF DAIRY PRODUCTS

Since 1940 the United States has been a net exporter of dairy products. In contrast, during the period between the two world wars this country was a net importer of dairy products largely of foreign-type cheeses.

The proportion of domestic production exported reached a peak in 1944 when 5 per cent of the milk produced was shipped abroad. In 1947 a little more than 3,000,000,000 pounds of milk equivalent, or 3 per cent of the milk output, were exported. However, exports vary considerably among the manufactured products. Exports accounted for more than half of domestic output of dry milks, nonfat dry milk solids, and whole milk. Exports of canned milk and American cheese amounted to about 15 per cent of the domestic output. Very small quantities of butter were shipped abroad.

CIVILIAN CONSUMPTION OF BUTTERFAT AND NONFAT SOLIDS

In determining the milk equivalent of production and consumption of dairy products, conversion factors based on the relative amounts of butterfat contained in the various products have been used. On this basis, total civilian consumption of all milk and dairy products in 1947 was the largest in any year since 1930, the earliest year for which data are available. Consumption on a fat-solids milk equivalent basis totaled 116,000,000,000 pounds in 1947, compared with 113,000,000,000 pounds in 1946 and a 1935-39 average of 104,000,000,000 pounds. Because of the large increases in civilian population, however, the per capita consumption was 810 pounds milk equivalent, about equal to pre-war and 1946.

The consumption pattern among commodities varied widely compared with pre-war. The 1947 per capita consumption of butter was substantially below pre-war; that of fluid milk and cream was somewhat below the wartime peaks. Per capita consumption of butter in 1947 was 11½ pounds, somewhat higher than the previous year but substantially below the 16.7 pounds in 1935-39. Consumption of all cheeses, excluding cottage, pot, and baker cheese, for the first time exceeded 7 pounds per person, about 30 per cent above pre-war. Also, consumption of canned milk during 1947, in part due to the higher birth rate in recent years, exceeded 20 pounds per person, an all-time high. Fluid milk and cream consumption was about 400 pounds, nearly 5 per cent below 1946 but 20 per cent above the pre-war average.

The milk equivalent of production and consumption of dairy products also can be determined by using conversion factors based on the relative amount of nonfat milk solids (protein, minerals, and milk sugar) contained in the various products. Milk products that contain nonfat milk solids are among the more important nutritional sources of calcium and riboflavin. In view of the possible deficiencies of these two nutrients in civilian diets, this method of calculating milk equivalent is receiving increasing attention. Figured in this way, the civilian per capita consumption of all milk and dairy products on a milk equivalent basis in 1947 was about 550 pounds, compared with 580 pounds in 1946, an all-time high, and a 1935-39 average of 431 pounds. The difference between the civilian consumption of all milk on a fat and nonfat solids basis largely represents nonfat solids (skim milk, buttermilk, and whey) fed to livestock or used for industrial casein.

INSECT PESTS AND PLANT QUARANTINES

By P. N. Annand

Chief, Bureau of Entomology and Plant Quarantine, Department of Agriculture

---

GENERAL

Much emphasis has been placed on research to determine the value of new chemicals that show promise for possible use as insecticides and in improvements in methods and equipment for applying insecticides and fumigants. The principal problem at present relative to the use of the newer materials concerns the possible hazardous effect on man and animals of residues remaining on food and forage crops, and the possible harmful effects of continued application of these materials on soils. Prevention of plant-pest introduction through air commerce is still one of the outstandingly important problems. The use of new and improved materials, methods, and equipment has aided greatly in a number of large-scale insect and plant-disease control programs carried on in cooperation with state and other agencies, and has made possible some additional modifications in treatments required for certification of materials to permit movement under plant quarantine regulations.

FURTHER DEVELOPMENTS OF NEW INSECTICIDES AND METHODS OF APPLICATION

Experimental work of an extensive nature has been continued to determine the most suitable formulations and schedules for use of DDT on various crops against different insects, and a few additional recommendations have been made. Several of the newer organic materials have been tested extensively and showed much promise. They included benzene hexachloride (see the 1946 review), chlordane (previously designated as 1068), a chlorinated camphene (Toxaphene), hexaethyl tetraphosphate, tetraethyl pyrophosphate, and others.

Present experimental evidence indicates that some of these compounds are highly effective against pests not controlled by DDT and that some give even more effective control of certain pests against which DDT has shown considerable promise. Benzene hexachloride continued to show up well in experiments for the control of certain insect pests of cotton, and mixtures of this material with DDT were found effective against many cotton pests. The gamma isomer was found to be more toxic to insects than the other isomers. Chlorinated camphene (Toxaphene) showed promise against several different kinds of insects in laboratory and small-scale field tests. Chlordane was found to be very effective against cockroaches and grasshoppers and also showed promise as a soil insecticide when tested for the control of Japanese beetle grubs. Hexaethyl tetraphosphate in preliminary tests showed promise for the control of orchard mites. Aerosols containing this material gave unprecedented control of the two-spotted spider mite on roses in commercial greenhouse tests. Tetraethyl pyrophosphate was found to be more toxic than hexaethyl tetraphosphate in tests against several species of insects. An advantage of the newer insecticides lies in the extremely small quantities necessary to give good control of insect pests. However, it has not yet been possible to recommend the use of these newer materials. Much more must first be learned regarding their toxicological effects. Facilities for conducting such studies have been established.

Further progress has been made in improvements in methods and equipment for applying insecticides. Continued investigations on the chemical phases of aerosols have disclosed that carbon dioxide absorbed in acetone can be used as an inexpensive solvent and propellant for aerosols for field use. The use of liquefied-gas aerosols to destroy agricultural pests and insect vectors of disease in airplanes is under investigation. Additional progress has been made in the application of insecticides from the air.

SCREW-WORMS

The screw-worm survey was continued during 1946. Because of the shortage of turkey red oil used in Smear 62, a formula known as EQ Smear 82, in which *n*-butyl alcohol and a sodium salt of an alkylated aryl polyether sulfate are substituted for turkey red oil, was recommended during the year as an alternate treatment for screw-worms.

OTHER LIVESTOCK PESTS

A sucking louse, *Haematopinus quadripertusus* Fah., a serious pest of cattle commonly referred to as the tail louse, first found in this country in Florida in 1945, was found in several localities in that state and in Texas and Alabama in 1946. Chlordane and chlorinated camphene were evaluated in preliminary tests against several pests of livestock and show promise for the control of some kinds of ticks and lice on cattle. Little information is available, however, on possible toxicological effects of these materials to livestock. DDT sprays have been found to provide excellent control of horn flies and lice on cattle. Benzene hexachloride proved to be more toxic than DDT to sucking lice on cattle and biting lice on goats, and to lone star ticks. It does not, however, have residual effect comparable to DDT. Combinations of DDT and benzene hexachloride show promise for the control of certain ticks on livestock.

FRUIT INSECTS

DDT again gave outstanding control of the codling moth and deposits of it, even when as much as 10 days old, were toxic to the moths and reduced egg laying. It also showed promise against such major pests as oriental fruit moth, pecan and chestnut weevils, shot-hole borer, and sucking bugs on peaches. Preliminary tests indicated that benzene hexachloride, hexaethyl tetraphosphate, chlordane, and other newer insecticides may have value for specific fruit pests. Comstock mealybug populations were markedly lower than in 1945, and more so in DDT- than in lead arsenate-sprayed orchards. The mango fruit fly (*Dacus dorsalis* Hendel) was found in Hawaii in 1946.

JAPANESE BEETLE

The cooperative milky disease distribution program resulted in the treatment of approximately 9,500 acres with milky-disease spore dust during 1946 in 11 states. The application of DDT dusts to empty and then loaded refrigerator cars and trucks carrying white potatoes to make and keep them free of living Japanese beetles was authorized on May 17, 1947. This method not only permits immediate movement of the produce but costs less than fumigation with methyl bromide. The Federal Japanese beetle quarantine was amended, effective May 17, 1947, to include additions to the regulated area in New York and West Virginia.

WHITE-FRINGED BEETLE

Some additional areas have been found infested, and these insects are now known to be present on approximately 200,000 acres in Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, and South Carolina. Control measures were applied to locations where they were considered essential for reduction of populations and in situations presenting a hazard of long-distance or important local spread. In preliminary tests, chlorinated camphene showed some promise against these insects. State and Federal quarantines were revised to include new areas of infestation.

EUROPEAN CORN BORER

During 1946, two states, North Dakota and South Dakota, and 45 counties in previously infested states were added to the known infested area. Losses occasioned by this insect totaled about $37,000,000 in 1946. Substantial progress was made in developing suitable methods of using DDT against this insect. However, the major limitation to the use of DDT on forage crops continues to be the possible poison hazards to man or animals of residues remaining on treated forage. In cooperation with state agencies, over 400,000 parasites of this insect were released in 14 states.

GRASSHOPPERS

Chlordane is one of the most promising insecticides tested thus far for control of these insects when applied directly to heavy vegetation along fence rows, roadsides, and irrigation ditches. In the spring of 1947 the weather was favorable to a rapid hatching and development only in Arizona, California, Texas, and certain areas west of the Continental Divide. During 1946 cooperative control operations were conducted in 21 Central, Midwestern, and Western states, affording protection to more than 5,765,000 acres of crop and pasture lands valued at over $41,150,000.

STORED-GRAIN INSECTS

Several inert dusts were tested against these insects. Attapulgus clay, bentonite, silica gels, and diatomaceous earth gave good to excellent protection of stored seeds, pelleted and ground animal feeds, and powdered hand soap containing not more than 12 per cent moisture. Preliminary observations indicate that local application of fumigants to individual machines in flour mills can be dispensed with, if the entire dosage is fed into the flour stream at the breaker rolls with the machinery running a few minutes before the mill is shut down. Not only do results appear to be as good as when individual machines are treated, but the time required for the operation is reduced from several hours to a few minutes.

VEGETABLE INSECTS

Aerosol insecticides containing hexaethyl tetraphosphate have shown good results in the control of certain greenhouse pests not affected by those containing DDT. DDT aerosols have also shown promise in the control of aphids affecting canning peas. Against insects attacking beans a dust containing DDT, rotenone, and sulfur was found to be an effective all-purpose treatment. This mixture controlled the Mexican bean beetle and powdery mildew disease, as well as corn earworm. DDT was found to retain its toxicity to wireworms in the soil for at least three years, but to kill very slowly. Benzene hexachloride was found to be extremely toxic to wireworms, but even in quantities as small as ½ pound of the gamma isomer per acre affected the flavor of potatoes, carrots, and beets. Benzene hexachloride and chlorinated camphene were found to be very toxic to the tobacco hornworm. Chlordane and benzene hexachloride sprays were found to be toxic to some stored-tobacco insects. However, the disagreeable odor of benzene hexachloride precludes its use on tobacco. The use of DDT can be recommended for the control of pea weevil and the pea aphid, provided that until the residue situation is clarified the pea vines are not to be used as forage for livestock. An investigation of the control of the pea aphid on peas grown for processing in Washington and Oregon was initiated, and attention was directed towards the successful application of insecticides from the air.

In cooperation with the Federal Bureau of Plant Industry, Soils, and Agricultural Engineering, studies were initiated on the effect of DDT and benzene hexachloride accumulations in the soil on plant growth.

PINK BOLLWORM

New infestations in two Texas counties, Hockley and Wharton, represented the only spread of the pink bollworm during 1946. Infestation was extremely light. Although it is not possible to evaluate fully the results of DDT applications in June 1946 to heavily infested areas of the lower Rio Grande Valley of Texas and Mexico, those fields treated developed very little infestation. Administrative instructions, effective Oct. 28, 1946, modified requirements of certification of cottonseed for movement to points outside the heavily infested area by authorizing an alternate method of treatment involving fumigation with methyl bromide.

Cooperative work with Mexico has continued to be very worthwhile, and one outstanding achievement during the year was the adoption of fixed-planting and stalk-destruction dates in the Matamoros-Tampicos, area to conform with dates applicable to the adjacent area in the lower Rio Grande Valley of Texas.

OTHER COTTON INSECTS

In 10 of the 12 states where the boll weevil occurs it caused greater reduction in yields in 1946 than in 1945. Benzene hexachloride tested in the laboratory and under field conditions on the major cotton insect pests continues to give promising results. In cooperative field experiments conducted during 1946 in South Carolina, Mississippi, Louisiana, and Texas, dusts containing 5 per cent of the gamma isomer gave satisfactory control of the boll weevil and the cotton aphid. In laboratory tests, chlorinated camphene and chlordane gave promising results against a number of cotton insects, including boll weevil, cotton aphid, cotton flea hopper, and garden webworm; hexaethyl tetraphosphate gave excellent control of spider mite adults and nymphs on cotton in a greenhouse when applied as a spray at strengths of one pound per 100, 150, and 200 gallons of water.

FOREST INSECTS

The results of large-scale application of DDT by aircraft, blower apparatus, and knapsack sprayers to gypsy moth infested territory in northeastern Pennsylvania have been very satisfactory.

DDT sprays applied by airplane to valuable timberland in Idaho, Washington, and Oregon controlled a serious outbreak of Douglas-fir tussock moth. This program, conducted in cooperation with the Forest Service, the states, and private timber owners, involved the application of 390,881 gallons of insecticide, dispersed at the rate of slightly less than one pound of DDT to one gallon of solvent per acre, to 413,469 acres of timberland. C-47 and other types of multi-engine planes, as well as small planes, were used in these operations. It was important that spray applications be made while the young caterpillars were feeding; therefore, operations were begun on May 22, 1947, and completed on July 2, a record for such a large-scale operation. Inspections made shortly after the spraying disclosed no living tussock moth caterpillars in the treated area.

Preliminary experiments using a mist blower for the application of DDT to prevent the feeding by elm bark beetles on twigs of elm trees gave promising results. The large-scale field spray tests with DDT against sucking insects that may transmit the virus causing phloem necrosis are being continued. Tests of DDT and benzene hexachloride for control of *Ips, Dendroctonus,* and *Scolytus* beetles in various species of pine, spruce, and fir have given very encouraging results.

Chemical treatments for insulation of underground wire and cables in the Canal Zone have proven effective in giving needed protection against termites.

A 0.4 to 0.8 per cent gamma isomer concentration of benzene hexachloride in fuel oil gave satisfactory protection to green logs and lumber against attack by ambrosia beetles.

BEE CULTURE

An outstanding feature of the year's work was the demonstration that *Bacillus larvae,* the organism causing American foulbrood in honey bees, produces, not one, but four separate antibiotic substances, one of which is active against the bacillus responsible for an important disease of man. By appropriate chemical treatment the toxicity of these antibiotics has been greatly reduced. For the first time, only artificially inseminated queen bees were used in studies on resistance to American foulbrood.

FOREIGN PARASITE INTRODUCTION

Shipments of leaf-feeding insects from Australia for the biological control of the Klamath weed were continued. Field establishment in California has already been demonstrated in all the colonies of *Chrysolina hyperici* Foerst. and *C. gemellata* Rossi released during the last two years.

In cooperation with other Federal bureaus as well as state agencies, arrangements were made for forwarding three species of parasites of the Comstock mealybug to Canada; of *Macrocentrus ancylivorus* Roh. to Argentina and Italy for control of the oriental fruit moth; and of *Copidosoma koehleri* to Italy for use against the potato tuberworm.

DUTCH ELM DISEASE

There was considerable extension of the known limits of infection. The Federal quarantine to retard interstate spread of this disease was revoked on May 1, 1947. This action was taken because the bark beetles that spread the disease move considerable distances by natural means which can not be controlled by quarantine action. The quarantine prohibiting the importation from Europe of articles that may carry the disease fungus remains in force.

WHITE PINE BLISTER RUST

Since its separate introduction into the Northeastern and the Northwestern states, this disease has spread slowly but steadily, until it is now present in the principal commercial white pine regions. During 1946 more than 25,000,000 ribes bushes were removed from 1,891,809 acres, of which 663,382 were initial eradication and 1,228,427 were rework. Ammonium sulfamate, 2,4-D, and other new chemicals have improved eradication methods.

BLACK STEM RUST

Wheat losses from stem rust during 1946 were light. Several of the newer herbicides were tested on common barberry (*Berberis vulgaris*) with some success. During the 1946 season 13,545,204 barberry bushes were destroyed on 2,561 properties covering an area of 21,930 square miles, in the 18 states comprising the barberry eradication area.

FOREIGN PLANT QUARANTINES

Inspection of 38,530 ships during the fiscal year ended June 30, 1947 represents a decrease of 16 per cent below the number inspected in the previous year, but the number of ships arriving that carried prohibited material rose from 18 per cent to 22 per cent. During the year, 58,519 airplanes were inspected at 44 ports of entry. This total includes 4,666 arrivals from the mainland which were inspected in Hawaii by Federal personnel, and is substantially the same as the 1946 total despite the use of larger planes, the greater proportion of commercial flights, and the factors which tended at times to reduce air travel during the year. Prohibited plant material was found on 27 per cent of the planes, an increase over 1946. A total of 5,252 interceptions of insects and plant diseases was made from airplanes. The number of inspections of freight cars from Mexico totaled 68,675 of which 8,057 were fumigated as a condition of entry. A total of 7,044,096 other vehicles and 1,581,432 pieces of baggage was examined, in cooperation with United States Customs.

In Hawaii, the plant quarantine program is one of preventing foreign plant pests from being introduced into the Territory, or *via* Hawaii to the mainland and the plant pests of Hawaii from spreading to the mainland. This work is conducted jointly, under Federal supervision, with representatives of the Territorial government. All aircraft arriving in the Territory and surface vessels arriving in Pearl Harbor from the mainland are now inspected by Federal personnel. All aircraft from abroad are now disinsectized for agricultural pests on arrival in Hawaii. Inspection at Hawaii of aircraft departing for the mainland removes pest risk at or nearer its origin and also saves manpower on the mainland. During the year a laboratory was established at Beltsville, Md. for the study of the problem of "hitchhiking" insects and the development of aerosols and residual sprays that will kill all types of insects that may gain entry into the plane compartments, and of other treatment methods that will quickly eliminate insects that infest fruit, plants, etc., that are carried as cargo.

FISHERIES

By Albert M. Day
Director, Fish and Wildlife Service, Department of the Interior

GENERAL PRODUCTION

In 1947, as in each year since the United States entered the Second World War, the fishing industry was unable to increase the yield of fish and shellfish significantly above the average pre-war catch. The total production of fish and shellfish in 1947 was about 4,400,000,000 pounds, the same as in the previous year, and on a par with the 1935-39 average. At the beginning of the war, the requisitioning of a large portion of the fleet of fishing vessels by the Armed Services, and restrictions placed on the operation of fishing craft prevented an increase in the yield. Since the end of the war, failure of pilchard and salmon to appear in normal quantities off the coasts of California and Alaska, respectively, has held the catch near pre-war levels.

The 1947 yield of fishery products was notable for record catches of menhaden and tuna, which were responsible for maintaining the catch at the previous year's level, despite the continued failure of the pilchard fishery, a relatively small yield of salmon, and a decline in the catch of rosefish.

MENHADEN

In 1946, menhaden occupied first place in so far as volume of the catch is concerned. During that year, 916,000,000 pounds were taken by United States fishermen, which represents the largest catch of menhaden in the history of the fishery. In 1947, menhaden were even more plentiful, and the yield increased to about 1,000,000,000 pounds. Landings of these fish accounted for over 20 per cent of the total United States and Alaskan catch, nearly double the production of salmon, the second most important species. As in previous years, nearly the entire catch of menhaden was used in the manufacture of fish meal, which is used in animal feeding, and oil, which is used in industrial processes, such as the manufacture of soap, paint, etc., as well as in animal feeding.

PILCHARDS

The 1947 Pacific pilchard or sardine catch, which amounted to less than 250,000,000 pounds, was the smallest for over 20 years. The yield in the San Francisco district of California was a complete failure, amounting to less than 150 tons, compared with a 1941-45 average of over 130,000 tons. The Monterey, Calif. production likewise declined from a 1941-45 average of nearly 210,000 tons annually to less than 15,000 tons. In 1946, the San Pedro catch totaled 214,000 tons despite small catches in the San Francisco and Monterey districts. However, in 1947, the San Pedro production declined to 97,000 tons.

TUNA

Tuna landings in the Pacific Coast States during 1947 were even larger than the record yield in 1946, and a new pack record of about 5,700,000 cases was established. This was nearly 1,000,000 cases over the previous year's pack. A new development in the tuna fishery was the use of a large factory ship in Costa Rican waters to freeze tuna on the fishing grounds and deliver the fish to a plant in Astoria, Ore. for canning. Several additional floating freezers were expected to begin similar operations early in 1948. Expeditions also were preparing to explore the possibilities of developing the tuna resources of the South Pacific, in waters formerly fished by the Japanese.

SALMON

Salmon were more plentiful in both the Pacific Coast States and in Alaska than in the previous year. The canned pack totaled about 5,200,000 cases, an increase of nearly 600,000 cases over the 1946 production. Runs of salmon have been below normal since 1941. During the years from 1942 to 1947, the average annual pack of salmon was nearly 2,000,000 cases below the average yield in the previous six years. Although below normal in size, recent salmon packs have been the most valuable in history. The 1947 production yielded packers close to $100,000,000.

SEA HERRING

Sea herring support important fisheries in Alaska and in Maine. The Alaska catch in 1947 totaled about 195,000,000 pounds, slightly less than in the previous year. Nearly the entire Alaskan catch was used in the production of fish meal and oil. Small quantities also were used for salting and as bait. The Maine catch of sea herring was approximately the same as in the previous year, when 80,000,000 pounds were taken. The Maine catch and imports of these fish into Maine from Canada are used principally in the canning of sardines. The 1947 pack of sardines in Maine amounted to 2,400,000 cases, about 20 per cent less than in the previous year.

MACKEREL

The California pack of canned mackerel exceeded 1,000,000 cases for the first time since 1940. The catch of these fish in Maine and Massachusetts, which is marketed principally fresh or frozen, showed little change from the previous year's landings of 39,751,000 pounds.

ROSEFISH

Rosefish were the most important food fish taken on the Atlantic Coast in 1946, when the catch amounted to 180,000,000 pounds. Because of reduced demand for fresh and frozen fish during the early months of 1947, the catch of rosefish declined about 50,000,000 pounds, and the haddock resumed its normal position as the leading food fish taken on the East Coast.

PRINCIPAL FISH PORTS

The leading United States fishing ports in 1947, in weight of fish landed, were San Pedro, Calif.; Lewes, Del.; and Boston. San Pedro, which has held first place for the past four years, handled over 430,000,000 pounds in 1947, consisting principally of pilchards or sardines, tuna, and mackerel. Lewes, which is exclusively a menhaden port, maintained its position in second place with landings of about 250,000,000 pounds. Boston moved into third place, when it resumed its position as the principal New England fishing port with landings which totaled over 200,000,000 pounds. Prior to 1943, Boston had held first position in New England from 1908 to 1942. However, in 1943, and for the following three years, Gloucester had moved into first place. Landings at Boston consisted chiefly of cod, flounders, haddock, mackerel, pollock, and whiting. Because of the continued failure of the pilchard fishery in the San Francisco and Monterey districts of California, these ports, which are normally among the leading fishing centers of the nation, occupied relatively minor positions as United States fishing ports.

CANNED FISH

The 1947 production of canned fishery products was about the same as in 1946, when the pack amounted to nearly 700,000,000 pounds, valued at $227,000,000. However, the value of the pack was considerably greater. Five items accounted for over 75 per cent of the 1947 canned pack. These were salmon, tuna, California pilchards or sardines, Maine sardines, and mackerel. The packs of salmon, tuna, and mackerel were greater than in 1946. However, the production of Maine sardines declined about 20 per cent, while the pack of California pilchards or sardines fell off nearly 50 per cent.

FROZEN FISH

A total of 240,000,000 pounds of fishery products were frozen in 1947 by United States and Alaskan firms reporting their activities to the Fish and Wildlife Service. This was 40,000,000 pounds less than in the previous year. A reduction of 15,000,000 pounds in the freezings of rosefish, and 10,000,000 pounds in the quantity of salmon frozen during the year accounted for much of the decline. At the end of 1946, stocks of frozen fish amounted to 158,000,000 pounds, the largest in history. Since the market for frozen fish was sluggish during the first seven months of the year, the production of frozen fish was reduced, and freezings during this period amounted to only 116,000,000 pounds, compared with 152,000,000 pounds for the same period in 1946.

FISH MEAL AND OIL

Production of fish meal in 1947 totaled about 190,000 tons, slightly less than the 1946 yield of 199,555 tons. Fish oil yield declined from 19,000,000 gallons to about 15,000,000 gallons. The considerable decrease in the production of fish oils resulted from the failure of the pilchard fishery in California, and the unusually low oil content of the menhaden taken on the Atlantic Coast. The total yield of fish oils during 1947 was less than half the average production during the period from 1935 to 1939, while the production of meal was about 15 per cent below the 1935-39 average. The disastrous pilchard season in all districts of California was responsible for the major portion of the decline in the yield of meal and oil.

FUR SEALS

A total of 61,447 fur-seal skins were taken in the government-administered sealing operations on Alaska's Pribilof Islands during 1947. This represented a decrease of 3,276 skins from the 1946 take. The decrease was owing to earlier termination of sealing operations, which was made necessary by the early mingling of the young males with family groups. The take of seals is confined to young males which are segregated from the rest of the herd during the early part of the season. The seal herd numbered 3,613,653 animals when the annual census was taken in August. This was an increase of 6.72 per cent over the 1946 census of 3,386,008 animals.

The present value of the Pribilof Islands herd is estimated to be in excess of $100,000,000. When the Federal Government assumed active management of the fur seals in the Pribilofs in 1910, the herd contained only 132,279 animals. By careful conservation, the herd has been developed to its present size and, at the same time, has produced nearly 1,500,000 skins. At the public auctions held in St. Louis April 14 and Oct. 6, 48,712 fur-seal skins were sold for the account of the Government. The total amount received for the skins was $2,607,387, an average of $53.53 per skin. Because of the new fashion trend to longer coats, the large matara sealskins were in particular demand and sold at $123 each, the highest price paid in 27 years.

FISHING FLEETS

The construction of fishing vessels continued at an accelerated pace. About 1,275 vessels of five net tons and over received their first documents as fishing craft in 1947. This was about four times the number of craft added to the fleet annually prior to the Second World War. In the years from 1945 to 1947, inclusive, about 3,100 vessels joined the domestic fishing fleet, which numbered only 5,562 vessels in 1940. Since the new vessels are larger, more heavily powered, and better equipped than the craft they are replacing, the production capacity of the fleet has, in theory, been greatly increased. However, there are indications that fleets of vessels for certain fisheries have been overbuilt, since the construction of additional craft has not increased the total catch. During the year, a considerable number of shrimp vessels were sold to Mexican interests and taken to that country to engage in the Mexican shrimp fishery.

FOREIGN TRADE IN FISH AND FISHERY PRODUCTS

Both imports and exports of fishery commodities declined in volume during 1947 according to data covering the first eight months of the year. Exports declined over 10 per cent, compared with the same period in 1946, while imports declined 25 per cent. Imports of groundfish fillets from Canada, Newfoundland, and Iceland, which had increased from less than 10,000,000 pounds annually prior to the United States entry into the Second World War, to 49,200,000 pounds in 1946, declined sharply in the early months of 1947. At the end of August, imports of these fillets amounted to only 16,000,000 pounds, compared with 33,000,000 pounds for the same period in 1946. Imports of shrimp from Mexico, which totaled 12,000,000 pounds in 1946, likewise declined in 1947. Late in the year, the first shipments of canned crab meat from Japan since 1941, were received at Pacific Coast ports. Prior to the war, from 7,000,000 to 10,000,000 pounds of canned crab meat were received from Japan annually. The discontinuance of export restrictions on shipments of fresh salmon from Canada to the United States in the fall of 1947, resulted in millions of pounds of salmon being diverted from Canadian canners to packers in the United States, whose prices were above those offered in Canada.

SUPPLY AND DEMAND

Domestic and foreign requirements for canned fishery products continued to exceed the supply and grocers' shelves were bare of many varieties of canned fish for considerable periods during 1947. However, there was an apparent surplus of fresh and frozen fish during the first half of 1947. At the beginning of the year, stocks of frozen fish were nearly 30,000,000 pounds above the 5-year average, and prices for many items declined sharply. Fishermen were unwilling to operate at the prices offered and receipts fell off. Landings at Gloucester, the nation's leading fresh fish port in 1946, amounted to only 75,000,000 pounds in the first seven months of the year, compared with 130,000,000 pounds for the same period in 1946. However, in August, when it became apparent that supplies of meat would decline, and that increased quantities of food were required for export, prices improved and landings increased. The production of fish meal and oil was far short of requirements. When these items were removed from price control in 1946, fish oil was yielding producers about 68 cents per gallon, while meal was selling at about $70 per ton. By the end of 1947, the price of oil had increased to about $1.70 per gallon, and meal was yielding about $180 per ton.

FORESTRY

By Charles E. Randall

Information Specialist, U. S. Forest Service

INTERNATIONAL TIMBER CONFERENCE

An international timber conference was held in Marianske Lazne, Czechoslovakia, April 28 to May 10, 1947, with 26 nations represented, including the United States. The immediate subject of consideration was the acute post-war shortage of timber products in Europe. The conference recommended certain short-term measures to cover as far as possible the immediate timber requirements of Europe and non-European countries bordering the Mediterranean. These included a 10 per cent increase in cutting for production of sawn softwoods in 1948-49, increased exports from countries within Europe and the Mediterranean area, possible additional exports from Germany and overseas sources, and economies in the use of timber and limitations of its use.

The conference also gave consideration to worldwide, long-term forest problems. Its long-term recommendations included: establishment by all countries of rational domestic forest policies based on the wise use of existing forests, reforestation of denuded lands, and afforestation of waste land; and steps by European governments to control fellings, not only in forests under state control but also in private forests, with the object of obtaining a sustained and, if possible, increased output. The conference emphasized the importance of periodic surveys of forest resources and annual felling statistics. It urged the expansion of forest research, especially as regards the management and utilization of tropical timbers. It recommended that the Food and Agricultural Organization of the United Nations, in consultation with member governments, should investigate the possibilities of international control of forest pests, and of standard requirements for certification of forest seeds and plants. It also recommended that FAO should proceed further with the collection and distribution of information regarding technical progress in forest industries.

UNASYLVA

The first issue of *Unasylva,* an international periodical devoted to forestry and forest products, appeared in July, 1947. The magazine, to be issued bi-monthly, is published by the Division of Forestry and Forest Products of the United Nations Food and Agriculture Organization at its temporary headquarters in Washington, D. C. First issues were published in English and French editions; a Spanish edition was planned later.

FOREST PESTS

To control a serious outbreak of the tussock moth, which was threatening large areas of timber in northern Idaho, the United States Forest Service, in cooperation with the Bureau of Entomology and Plant Quarantine, in the late spring of 1947 carried out the biggest forest insect control project ever undertaken. The operation involved airplane spraying of DDT over 413,469 acres. More than 2,000 individual airplane flights were made, and 391,000 gallons of insecticide distributed. No living tussock moth caterpillars were found on treated areas after the spraying. The project cost approximately $600,000; the value of timber at stake was estimated at $60,000,000. Private land owners, the State of Idaho, and the Federal Government shared in financing the project.

In southern Idaho, more than 50,000 infested trees were felled in an effort to control an epidemic of bark beetles which threatened to wipe out all mature lodgepole pine over a vast area, including Yellowstone National Park. It was expected that follow-up work would be needed for several years to bring this infestation under full control.

During the year the Forest Service reported its findings in a nationwide study of losses caused by destructive forest insects and diseases. Although diseases and insects are causing greater losses in standing timber than does fire, the report stated much less progress has been made in controlling them. In most parts of the country, man's activities have upset the natural balance among native organisms in the virgin wilderness. Complicating the situation still further is the accidental introduction of a number of highly destructive foreign pests, such as the white pine blister rust, the Japanese beetle, the Dutch elm disease, and the chestnut blight which in 40 years destroyed the American chestnut over its entire commercial range.

During the decade 1934-43, the annual estimated timber loss from insects and diseases was 622,000,000 cubic feet. The average annual loss from fire during the same period was

460,000,000 cubic feet. The estimated drain caused by insects and diseases represents only the more obvious losses, usually timber killed as a result of epidemic outbreaks. Tremendous additional losses are caused by the less spectacular work of a myriad of disease and insect pests ever present in the forests—wood borers, bark beetles, weevils, cankers, wilts, rusts, and wood rots which cause reduced or deformed growth of trees or lower the commercial value of the timber.

Congress in 1947 enacted a Forest Pest Control Act (Public Law 104, 80th Congress) which recognized the Federal concern and responsibility in the control of forest insects and diseases on a nationwide basis, and on lands in all classes of ownership. It provided general authorization for the establishment of more adequate services and facilities for detection and suppression of incipient epidemics, and authorized Federal cooperation with the states and with private forest lands owners to combat outbreaks of forest pests.

WOOD WASTE

The Forest Service in 1947 also issued a report on wood waste in the United States, the first attempt to analyze the problem on a nationwide scale. The report stated that tree tops, limbs, and cull logs left to rot in the woods after logging, slabs, sawdust, and edgings at the saw-mills, materials lost in pulping liquors, and other wastage in primary and secondary manufacturing of wood products all added up to an estimated total of 109,000,000 tons in 1944. Only 43 per cent of all the wood cut winds up in useful products, other than fuel. Twenty-two per cent is used as fuel, much of it inefficiently. Thirty-five per cent is not used at all.

Research conducted by the Forest Service and by forest industries has developed much more knowledge of how to reduce waste than has yet been applied. It is possible, for instance, to convert waste wood into industrial alcohol and high-protein stock and poultry feed. Saw mill trimmings and short pieces that can not be sold as lumber can be made into small-dimension stock, or into many small articles that are now generally cut from standard-length lumber. Much logging and mill waste might be used for pulpwood or converted into chemical products. However, transportation costs, lack of plant facilities, and other factors make the problem difficult. Much of the waste wood is so scattered that it can not at present be economically salvaged.

The report recommended continuing research, looking to development of new techniques for harvesting wood and making products with less waste, and new ways of utilizing what is now wasted. To get the results of such research into use, it recommended increased technical assistance to woodland owners and wood processors, and, where necessary to establish the practicability of new waste-utilization processes, public aid in financing pioneering operations. A major need is greater integration of timber products industries, so that one plant could utilize the by-products and waste materials of another, the report stated. One-product operations, still typical of the forest industries, tend to be wasteful.

Waste reduction will not of itself solve the problem of balancing timber growth and drain at the desirable level, stated the report, but cutting down waste can make the timber supply go further; it can provide more wood products without increasing the drain on the forests.

WATER RESOURCES

In his annual report for 1947, Lyle F. Watts, Chief of the Forest Service, emphasized the importance of forests and other wild land vegetation in the control of streamflow and the conservation of water supplies.

"Conservation of water," he said, "is of the utmost importance. Lack of enough water can limit the growth of communities, industries, agriculture. Floods—too much water in the wrong places—can cause terrible damage and loss.

"Muddy streams, dried-up springs,

lowered water tables, eroding lands and reservoirs filling with silt, damaging floods every year—all these things are plain indications that much watershed land is not being handled as it should be.

"Billions have been spent on levees, dams, and other large-scale engineering works as downstream defenses against floods. But we can not expect to provide the permanent safeguards which the national welfare requires unless we give adequate attention to watershed conditions on the lands upstream—where the floods come from . . .

"Damaged watersheds can be repaired. Rampaging streams can be brought under control. Water sources can be kept in good condition. And to a large extent the kind of forest and range management that restores and maintains good watershed conditions will also make for increased timber supplies and increased livestock production. Recreation and wildlife also will benefit."

PULP AND PAPER FROM ALASKA

For many years the Forest Service has been endeavoring to encourage the development of a pulp and paper industry in southeastern Alaska. Nearly all of the commercial timberland of this Alaska "panhandle" region is within the Tongass National Forest, and the stands are sufficient to support a large-scale industry which could materially increase United States supplies of paper, now seriously short. The predominating timber species—Sitka spruce and hemlock—are suited for paper production, and the region has abundant potential water power resources.

In 1945 the Forest Service invited prospective operators to investigate the possibilities of establishing paper mills in Alaska. The situation was complicated, however, by a large number of Indian claims asserting ownership to extensive tracts of land within the national forest. In July, 1947, Congress enacted legislation which provided that purchasers of national forest timber may operate under sale contracts free and clear of all Indian claims based on possessory rights. All fees collected by the Government for stumpage on the Tongass National Forest will be held in escrow pending the determination of such rights.

Following the passage of this legislation, the Forest Service formally invited bids for two large timber tracts in the Tongass National Forest. It was stipulated that operators will be required to follow cutting practices that will insure continuous timber growth, so that the development of a pulp and paper industry in Alaska will be on a permanent basis.

COOPERATIVE SUSTAINED YIELD UNIT

Operations began during the year in the Shelton Cooperative Sustained Yield Unit, the first unit established under the Cooperative Sustained Yield Units Act of 1944. This unit was set up through an agreement between the Forest Service and the Simpson Logging Company of Shelton, Wash., which provides for the sustained yield management of 270,000 acres of forest land for 100 years.

Located in the southern base of the Olympic Peninsula, the unit includes 112,000 acres of national forest land and 158,000 acres of private land. The national forest land involved supports old-growth Douglas fir, western hemlock, and associated species. Logging company lands include mostly second growth not yet large enough for sawlogs. By combining the management of the old growth national forest timber and the more extensive second growth stands of the company, it will be possible to maintain essentially the present rate of cut. The old growth timber will be allotted for cutting in an orderly fashion, and growth accruing in the young stands will provide the desired annual harvests of sawlogs after the cutting of virgin stands is completed. New growth meanwhile will be coming along on the earlier-worked areas, so that operations may be continued indefinitely.

It is expected that the timber harvested from the entire acreage will supply local industries with about 90,000,000 board feet of raw material every year, continuously. These industries, thus assured of a regular supply of timber by the cooperative agreement, will provide stability for the towns of Shelton and McCleary, Wash., with populations of 4,700 and 1,400, respectively.

The Forest Service had under consideration a number of proposals for similar action to support other communities by a sustained flow of forest products.

DIVISION XII

MINERAL INDUSTRIES

GOLD, SILVER, AND PLATINUM

By Donald M. Liddell
Consulting Engineer, New York

GENERAL

Gold and silver have always been described as the precious metals. To them may be added the platinum group—platinum, iridium, osmium, rhodium, palladium and ruthenium, distinguished by a high degree of resistance to corrosion, and high melting points—the noble metals.

GOLD

The peak of the world's gold production was reached in 1940 at 40,925,000 oz., and has since had a general downward trend, 26,800,000 oz. in 1946, and probably about 26,000,000 oz. in 1947. These figures are estimates, even as far back as 1940, for the Russians have given out no statistics since 1936, and one can only assume that Russian and Siberian production has remained constant at about 4,000,000 oz. per year, and that Japan, Korea and Manchuria have produced about 1,300,000 oz. per annum.

One of the factors which tended to produce this falling off in gold production, a decline in copper and lead output producing a reduction in the by-product output of gold, was reversed in 1947, but the major factor is still present in intensified form. This is that there has been no post-war advance in gold price to enable the gold producers to meet the inflated wage scales of industry and of the base-metal mines. The gold mines have, therefore, been forced to confine operations to a higher grade of ore than was profitably mined before, leaving the lower grade ores as "rock," or else make a smaller profit per ton treated, or both, and with staffs depleted by the inroads of more profitable industries.

Some recognition of these factors is even entering official minds outside the United States, as South Africa is offering some relief to the gold miner through diminished taxation, and Canada, second to South Africa as a gold producer, has put a bounty on increased gold production over the 1946-7 (fiscal year) output (see p. 505).

ORANGE FREE STATE AND THE RAND

Gold developments in the Orange Free State are still exciting much interest, both on the stock market and in the field. The Odenaalrust field (St. Helena) continues promise of being of considerable size. A large extension of the Rand area has resulted from some good geophysical prospecting, based on the easy tracing of a magnetite bed overlying the gold bearing banket.

Much interest was aroused during the year by the news that two large New York investment banking firms had entered the South African situation through a $10,000,000 investment in Anglo-Transvaal Consolidated Investment Co., acquiring through it a working control of New Union Gold Fields, itself a far-flung investment trust supposed to hold and manage about 200 distinct corporate entities in South Africa. The ink was hardly dry on the newspapers announcing this when it became known that the auditors for New Union Gold Fields had refused to certify to the June 30 balance sheet, alleging the profits amounting to £270,000 which should, in their opinion, have belonged to the company, had gone into the accounts of the two managing directors; that these directors had sold shares owned by them to the company at more than the market prices; that they had bought shares from the company at less than the market price; that they had loaned over £500,000 to themselves without proper authorization; together with other, but minor, irregularities.

As a result of these charges, early in October, Anglo-Transvaal completely took over the management of New Union; in late October the entire enterprise was placed under judicial control; and in early November, the judicial administrators reported that the cash was down to about £400,000, with commitments in excess of this amount (Consolidated Gold Fields carries nearly £3,500,000 in cash). The Attorney General of the Union of South Africa was at the same time understood to be looking into the management from the possibility of criminal action. Romance and high finance have not gone out of the mining industry.

THE GOLD PRICE

The price of gold in 1947 remained fixed in the United States at $35 per oz. Troy, and at 172s. 3d. in London, Canadian exchange being officially at only ½ per cent under par, resulting in a Canadian price of about $35.17. On Nov. 17, the Canadian Government announced that it purposed attempting to aid the gold producers in order to increase its supply of foreign exchange. This was to be done by a payment of $7 per ounce of fine gold for any excess of production by any company over the amount of gold that it produced in the fiscal year ended June 30, 1947. Although it was attempted to keep negotiations discreetly secret, it was understood that the United States immediately protested that this would bring an additional burden on our Treasury as it would ultimately have to buy this gold at $35 an ounce, and it was also understood that the Canadian Government pointed out that a bounty of this sort on gold was exactly parallel with what the United States had done as to its price of silver, but eventually the Canadian Government announced that it had revised its plan because of objections raised by the International Monetary Fund.

Under the amended plan the Canadian Government will pay one-half of the amount by which a mine's cost of production exceeds $18 per ounce on any gold produced in excess of two-thirds of the mine's output in the year ended June 30, 1947. The assistance will run for three years and will apply to production beginning Dec. 1, 1947. With regard to new mines, subsidy payments will apply to the total output for the first year, but only on the excess cost of two-thirds of this output in the two succeeding years. U. S. Secretary of the Treasury Snyder was still not satisfied and publicly commented "that the United States did not favor any tendency for countries to be dependent on a subsidized gold production . . . . for maintaining . . . . their balances of international payments."

THE BLACK MARKET PROBLEM

In general the international gold situation is a fine example of trying to gallop in two directions at once. While the United States is understood to have protested to Canada on having to take more gold, when the American Smelting & Refining Co. in the middle of the year, began marketing in non-dollar non-sterling areas certain gold derived from foreign refractory ores, immediate steps were taken by the Government to stop the practice, and pressure was brought on both the British and the South African governments to stop "black market" operations in their gold.

At the same time, both the Federal, and the South African authorities assured the world that such a market was small, and that the exchange balances thus created and the profits to be derived by allowing such sales would be negligible. If so, why not let the gold vacuum in these foreign territories be filled up, as a step toward normal trade?

On Aug. 27, 1947, the last free market in gold in Europe was obliterated. In November 1946, the Swiss took off all restrictions on transactions in gold. But in March, in order to assist the International Monetary Fund in trying to curtail all "black market" operations in the metal (translation—"free market"), gold export licenses were no longer given except where national interests were concerned. The National Bank of Switzerland, however, continued over-the-counter sales subject to a brokerage of 5 per cent, and a sales tax of 4 per cent. These transactions were running about $2,500,000 weekly at the time of the interdiction of these operations on Aug. 27.

Great Britain and France both drew heavily on their gold balances during 1947, and the United States gold stock (mainly at Fort Knox) is over 20,000 tons. Restrictive legislation grows throughout the world on the possession of gold coins or bullion, so that one can look forward to a comparatively near future when the possession by private persons of gold coin or bullion anywhere will be a crime, and all transactions in them a black market operation.

REVALUATION OF THE PRICE OF GOLD

The year was marked by many rumors of revaluation by the United States of the price of gold to bring it in line with other commodities. While these have all been groundless, the mere existence of such a stock of gold as is now in our Government's hands, is almost a guarantee that sooner or later the Government will revalue gold and so partially offset the towering public debt. On Dec. 31, 1946, the United States gold reserve was about 586,000,000 oz.

While it has not amounted to a gold revaluation, the Russian devaluation of the ruble is an operation closely akin to this, though this has in addition been class legislation, in that bank balances under 3,000 rubles were undisturbed, on the next 7,000 rubles two new were given for three old, and on all balances over 10,000 rubles one new ruble for each two old. On cash in hand, which was what the farmers mainly had, one new ruble was given for each ten. On Russian bonds, holders of the 1938 issue receive one ruble for five, and on ordinary bonds one new ruble for each three.

SILVER PRODUCTION

Silver production, like that of gold, has been declining since 1940, when it was computed at 273,400,000 ounces. The 1946 production was about 124,895,000 oz., the 1947 is estimated at 110,000,000 oz. United States production was 21,377,000 oz. for 1946, and may be estimated at about 34,000,000 oz. for 1947. Mexican production was 48,298,000 oz. for 1946 and was probably about 48,000,000 oz. for 1947. Canada produced 12,870,000 oz. in 1946 and about 10,000,000 oz. in 1947. Outside of North America, the important production comes from Peru and Australia, 14,467,000 and 7,000,000, respectively, in 1946.

The impact of social security laws, of levies on gross production rather than on profits, and other restrictive legislation, together with an inability to find new ore-bodies of substantial size, led the United States Smelting, Refining & Mining Co. to sell its Real del Monte and Pachuca properties to the Mexican government for 10,000,000 pesos (about $2,000,000) in the latter half of 1947. These holdings almost deserve the overworked adjective of "fabulous." Their production to date is probably about 1,200,000,000 oz. of silver and 4,500,000 oz. of gold. They were discovered in 1522, and it was here that Bartolome de Medina developed the patio process in 1557, replaced by cyanidation in 1906. It may be surmised that there will be some sort of a subsidized operation there under Mexican Government management, but at any rate the 425 year-chapter of private management is closed.

COMMERCIAL USE AND PRICES OF SILVER

Consumption in the United States greatly exceeds domestic production, a large use being in photography where unfortunately there is a great permanent dispersion and loss of metal. (Our use, outside of coinage, is three to five times our production.) As a consequence there have been wide fluctuations in the price of foreign silver during the year. (Domestic silver has ruled unchanged since July 1, 1946, at 90.5c. per oz.)

Foreign silver opened the year at a price of 83¾c. in New York, and 55½d. per oz. in London. Handy & Harman made some very bearish forecasts as to its commercial use declining, and in three weeks the price had dropped to 70¾c. in New York, the London price remaining unchanged, but the price in New York was back, varying from 80 to 84½c. per oz. by early March, while London had fallen to 50d.

The Reserve Bank of India announced the prohibition of silver imports into that country at that time, causing an overnight break of 5⅜c. in New York and of 4¾d. in London, followed by a decline that carried the prices quickly to 70⅞c. New York; 44d. in London. On June 17, silver went to 68⅜c., the lowest price since Sept. 21, 1945, and continued its retreat until it was 61¾c. New York; 37d. London in late July. A revival of the jewelry trade in midsummer brought an upturn, resulting in a slow upward movement and finally a steady price of 74⅝c. New York; 45d. London in November and December.

The complete estimate of the use of silver in the United States in 1946, made by the American Bureau of Metal Statistics may be of interest; Coinage, 44,122,000 oz.; sterling ware, 50,000,000 oz.; plated, 6,800,000 oz.; nitrate (chiefly consumed in photography), 22,500,000 oz.; unclassified (brazing alloys, bearings, electrical contacts, dental and surgical use, jewelry, etc.), 25,700,000 oz.; total 149,122,000 oz.

The total stock of silver held by the U. S. Treasury on Dec. 31, 1946, was 1,950,520,000 oz. (66,874.2 tons).

PLATINUM METALS PRICES

Except for platinum itself, the platinum metals were comparatively quiet during the year. The prices quoted at the first of the year 1947 were: Platinum, $53 per oz., having been reduced $7 per oz. on Dec. 31, 1946; iridium, $110; rhodium, $125; ruthenium, $56; but by mid-January the price of platinum was $58-61 per oz., depending on the size of the lot, and ruthenium was up to $61. On April 14, platinum was marked up to $63-66, but on May 5 was reduced to $50-62, and on June 9 to $56-59. Iridium had during the period been slowly sinking to $85-90 per oz. An attempt was made to establish an option market in platinum on the Commodity Exchange in August, but the movement seemed to have no support and was formally abandoned in September. In late August, platinum moved to $63-66 and, in early September, it rose to $66-69. On Sept. 22, it dropped back to $62-65 and on the 29th to $59-62; but again rose on Oct. 20, to $62-65, and by mid-December it was again $66-69. Ruthenium by mid-December was also $66-69; iridium $80-85; osmium, $100 in a purely nominal market; palladium, $24; rhodium, $125.

PLATINUM PRODUCTION

What the platinum production of the world may be, only the Russians know. Russia was for a long period the largest producer of the metal, and possibly still may be, but no outsider knows. Canada had a peak production of 285,228 oz. in 1942, 130,400 in 1946. This is a by-product production and varies with International Nickel's base-metal output. Colombia in the 30's had a large alluvial output, reaching 115,100 oz. in 1937, but for the last few years it has been about 35,000 oz. (38,500 oz. in 1946). South Africa had an all time peak of 85,730 oz. in 1941; 55,490 in 1946. The United States had a peak production of 44,783 oz. in 1938, but produced only 24,600 oz. in 1946. This is mainly from placers, but is in part a by-product from refining copper.

What influence Russia can have on the market was shown in the second quarter of the year when the U.S.S.R. alone sent to the United States 60,981 oz. of platinum metals against a total from all sources of 74,749 oz. in the first quarter, of which 10,821 oz. came from the U.S.S.R. Total imports in the second quarter were 118,727 oz. Platinum and palladium are chiefly used in jewelry, though their uses in the chemical industry, in electrical manufacture, and in jewelry are important.

PLATINUM HOARDING

Apart from the fluctuations in platinum prices due to variations in the jewelry trade, there seems little doubt that platinum prices in 1947 have been somewhat the result of the rise and fall of a demand for the metal for hoarding. It is in several respects ideal for this purpose, as it is of high specific gravity and has a high price, so a good sized safe deposit box will hold $100,000 worth; it does not oxidize; is not affected by contact even with strong acids; and it is unaffected by an ordinary fire. On the other hand, there is not the universal knowledge concerning it that there is concerning gold, and undoubtedly its marketability to a great extent depends on industrial activity, which would not necessarily be present in an emergency. Nevertheless, the *Far Eastern Economic Review* believes that the increasing restrictions on the ownership of gold will drive more and more persons into hoarding platinum, and that from the long-range point of view, the platinum market is in a favorable position.

On this question of hoarding, it should again be pointed out that it is also a question what platinum stocks the Russians might suddenly throw into the world market. It is conceivable though unlikely that enough platinum might be in stock and might be thrown on the market seriously to affect platinum as an inflation hedge.

IRON AND STEEL

By Thomas C. Campbell
News-Markets Editor, *The Iron Age*

GENERAL

The public quarrel between steel leaders and government bureaus over steel capacity has led many people to believe that the industry is lying down on the job, that the gray market includes most steel sales, and that a big increase in steel capacity would solve every problem. There is no real basis for any of these impressions, but part of the responsibility for these widespread beliefs belongs to steel management.

At no time in history has the steel industry lain down less on the job than during 1947. The medal of merit goes to production men, engineers, and the sales force. The high officials have not done as well as they could in their official and public pronouncements. Perhaps the reason is that anything the Administration says releases an automatic "no" in the minds of most steel officials.

Most government men, however, have their automatic reflex, too. They seem inclined to think that steel heads do nothing but contrive ways to embarrass the Administration. This sideplay, which has gone on for years, and which has little or nothing to do with what is really happening in the industry, sometimes does harm.

In May 1947, it appeared from newspaper reports of steel leaders' statements that the steel industry was against expanding. The old studies were brought out, refurbished, and presented. The past was cited, the future was looked at through smoked glasses, and the industry was pegged, after its May annual meeting, as being opposed to expansion. The industry was accused of trying to keep supplies short in order to make more money and to contribute to another depression.

Taking the bait, more outbursts from steel officials cemented the idea in the minds of the public that steel had departed from the free-enterprise, American way of doing things. They gave credence to a belief that no more expansion was necessary; that we had arrived; that there never would be any demand that the industry could not take care of with present capacity.

Some of the industry's best friends began to feel that the steel leaders, if left alone, would put this country in the same plight as in England. Then the industry's "carpers" had a field day with such phrases as "more abundance," more for everyone, a greater national income, etc. All this was unnecessary because industry spokesmen did not mean what they said.

Too late to prevent harm, the industry heads came to the country *via* a Congressional hearing route with a story that the industry was expanding. It looked as though this was a yarn thought up to offset the unfortunate one circulated in May. It was nothing of the sort. Expansion, as usual, had been taking place long before capacity became a national issue.

Steel has always done things to bring more money into the coffers, more customers, and better customer relationships. It has always expanded year after year. The record proves it, and it is expanding now. It undoubtedly will expand next year, but it will not take advice as to how much or how little it will expand from people who, the industry feels, do not know anything about the business. Even that is beside the question.

There is no evidence that there is any deterrent to continual expansion in steel except possibly the high cost of buying new equipment, but that can be overcome. The contemplated East Coast plant of the United States Steel Corporation is now being held up because the cost of new equipment is far in excess of original estimates. Eventually that will be overcome by competitive conditions.

Along with the paradox of seeing steel leaders try to force their way out of the May maze is the mistaken notion that all steel men think alike. It took a Congressional hearing to bring out that they do not. It should have come out much before then. If it had, the tremendous pressure for allocations, price controls, and expansion plans would be far less potent than it is now.

An aroused public, an election-conscious Administration, and steel consumers who have gotten the short end of the stick have plenty of ammunition to fire at the industry, regardless of the truth or falsity of the charges. Below are the facts about steel capacity, steel production, and the gray market.

STEEL EXPANSION

Steel capacity is being expanded now. Part of this expansion will be by actual increase in open hearths, part by use of more blown metal from the bessemer, part by use of oxygen, cutting down melting time, and part by superior performance of existing equipment. Most of the remarks made by steel and government officials have little to do with the actual question of capacity. The engineers and workmen are taking care of it. Competitive conditions will add more zest soon to the capacity question. The drop in steel capacity after the war was a realistic elimination of equipment which was held in operation because of the war. It was obsolete, and there was no valid reason to keep it going during peacetime. New capacity from now on will be the kind that will mean more production, faster output, and better quality. There is no more reason to take the word of government experts on capacity than there is to believe some of the statements by steel die-hards. Somewhere in between is the answer —and that is the direction in which expansion is now heading.

PRODUCTION

Steel production in 1947, at about 85,000,000 tons, was the highest in any peacetime year. It is below the all-time high in 1944, but it should not be compared with that year. In wartime, there is only one customer—the government. The number of orders, the type, the size, and the destinations are far different in peacetime. They are more numerous and varied. On that basis performance in 1947 was the best in steel mill history. The men who did it would, 10 years ago, have raised their hands in horror if the same job had been handed to them. That is why 10 years from now the same thing will be true. Steelworkers, management included, are the most loyal, hardest working group of men in any industry. Generations stick to it, complain about it, consider other jobs, go on strike, but they stick to steelmaking.

GRAY MARKET

Steel leaders harmed themselves by, at first, closing their eyes to the existence of a gray market in steel. They knew little if anything about it a few years ago because they were not involved in it, but it existed long before OPA went out, and it broadened out as steel became tighter. Rumors had it much larger than it was. It was this fallacious view that steel officials were attacking. It looked to the public and to steel customers, however, as if they denied that there was a high premium market. Later, most steel officials in Washington did agree that a gray market existed and said they were doing everything they could to stamp it out.

~~In~~ peacetime it is no crime to sell what you have for more than you paid. That is what customers did in 1947. It is what many will do next year or until the demand for steel moderates. A survey by *The Iron Age* showed that about 4.3 per cent of the steel being used by consumers was bought in the gray market. Circulating inquiries received by many steel users gave rise to rumors of tonnages far out of line with what actually was bought and paid for at premium prices, but the existence of a gray market was serious because it supplied the ammunition for the charge that the industry was bungling the job of steel distribution.

GRAY MARKET PARADOX

First denying that the gray market was a factor, later admitting before Congress that it was a factor, steel leaders finally attempted to stamp it out as far as their products were concerned. Again the lag in clear-cut acknowledgment meant much shifting that was unnecessary. *Iron Age* men, searching diligently for more than a year, have found no evidence that steel producers were involved in gray market activities or countenanced them. There are a few companies well known for their premium priced ingots but this is no mystery.

One would think that with capacity troubles, irate customers, gray market charges, tight steel, high prices, and the Administration belaboring it, the steel industry would be thoroughly hated by most of its customers, yet the majority of steel customers think the steel industry is doing a good job.

There was much talk in the fall of 1946 about the coming recession, depression, correction. There has been little or no talk about it in recent weeks. Steel leaders, who a year ago felt that demand and supply would be in balance by July 1947, now think that it may be in October 1949. The sustained demand for steel has so puzzled all the experts and non-experts that predictions are worth little. No one knows.

STEEL DEMAND

There was a late surge in the fall for more steel because demand at the other end was holding up. How long steel requirements will keep ahead of the high level output is harder to guess at now than at any other time in history. Some half-hearted attempts have been made to view the near future as bringing a correction in present high prices. The long term outlook for steel firms is good.

Most people think that the industry is trying to take care of a potential demand that was unsatisfied because of war output. That is only half the story. Those who went through the late depression know that it is trying to satisfy a demand which has been growing since 1929. In the depression period, things wore out and were not replaced.

In 1937, the situation looked good, but in 1938 fabricators coasted along at a high rate of output—only they used the steel they bought in 1937 to support the coasting. Then came the war and another five years of waiting.

It seems hardly likely that two years of post-war activity will take care of a demand that has been pushed from pillar to post for 10 or 12 years. At least that is what some steel men think. It is their guess that when the reaction (correction, depression, or movement) comes, it will last only about a year. It will not be deep as far as steel is concerned, and it probably will be followed by at least three or four years of healthy steel output. It is as easy to believe this as the opposite, but a little more costly.

STEEL PRICES

Most steel customers have been so anxious to get steel they are not acutely concerned about prices. Some have paid so much in the gray market that they regard present mill prices with indulgence. Most of the furor about steel prices has come from the Administration. The government position is well taken but not when it thinks producers can make steel with no return for stockholders. Steel people have to take care of new mills, the price of which will scare the finance departments. It is true that the price of steel governs most prices of articles made from steel. Steel is the "rock," and it is easily the most vulnerable to attack. That is why the Administration seems ready to strike at the steel industry in every major crisis.

PIG IRON AND STEEL OUTPUT IN NET TONS

* Estimated.

Steel prices (that part which the steel companies get) are not high in relation to everything else. They are manifestly low. They are some 40 per cent higher than they were in 1939, but weekly wages in steel were 98 per cent higher in 1947 than they were in 1939. The gray marketeers blithely add $150 a ton to the mill price and succeed in getting it. It may well be asked why steel companies do not raise prices to what the traffic will bear. That is supposed to be free enterprise. If the steel companies are what some people say they are why are they so disturbed everytime price is mentioned. The people who buy steel are not the ones who protest high prices. In a survey made early in 1947 it was remarkable that only 68.7 per cent of those steel consumers who were questioned thought steel prices too high. Even in that case some meant gray market prices. About 31.5 per cent said they were not too high or that they were about right.

THE PRICE PROBLEM

There must be some reason why the steel companies have not priced themselves out of the market. There are several obvious reasons. If steel prices are too high, competitors may take away some of each others business. If the price is raised too high a long-term customer relationship may end. If the price of steel is raised too much, labor or the government may take a large part of it. Each steel firm knows that the moment it takes an unfair advantage of the present situation, people will stop buying steel, the mills will get less orders, men will be laid off. What some pugnacious steel men want to know, however, is why not let this happen quickly instead of prolonging it when the end will be the same anyway. The answer to that is the "end" might and probably would not be the same. Steel management will have a difficult time figuring out what to do—give a wage increase and raise prices again or take full advantage of the contract, knowing well that there will be trouble. Probably there will be a wage increase, and a moderate and selective increase in prices on items which are steadily losing money such as ingots, semi-finished steels, coated sheets, etc.

ALLOY STEEL OUTPUT

(Thousands of Net Tons)

	Open Hearth	Per Cent of Total	Electric	Per Cent of Total	Total
1939	2,459	76.7	749	23.3	3,208

COAL AND COKE

By R. Dawson Hall
Mining Editor and Author

BITUMINOUS PRODUCTION

Conditions were favorable to the bituminous coal industry in 1947. The bituminous and lignite mines together produced about 619,000,000 tons as against 533,922,068 tons in 1946, an increase of 15.9 per cent. The gain in output would have been still more had there been no *in memoriam* and safety suspensions, no shorter working days and no holidays, and if car service had been adequate. Some of the mines toward the end of the year were idle three or four days a week for lack of railroad cars, and some coal companies were stocking coal near the mines, despite the many unfortunate experiences with that practice recorded in coal history. This time, however, the export and domestic demand appears likely to absorb these stocks before fire destroys them, if railroad cars can be obtained to move them. Coal stocked in the winter usually gives no trouble until summer. Vacations also promise a favorable time for selling the coal out of storage, because railroad cars will then be available for transportation. Prominent among the stock piles established were those at the Blaine mine of the Lorain Coal & Dock Co. where the coal was trucked to a storage pile and at the Willow Grove and Dun Glen mines of the Hanna Coal Co. of Ohio whence the coal was hauled in trucks to an outdoor reservoir. The Pittsburgh-Consolidation Coal Co. moved some coal by truck to market.

ANTHRACITE AND COKE PRODUCTION

Anthracite production totaled in 1947 about 57,000,000 tons as against 60,506,873 tons in 1946, a decrease of 5.8 per cent. These figures include colliery fuel, coal from washeries which separate good coal from stored refuse and undersize, coal reclaimed from the river bottoms, and coal shipped by truck from authorized operations.

Beehive coke production was 6,536,900 tons in 1947 as against 4,568,401 tons in 1946, a gain of 43.0 per cent. The output of byproduct coke also increased. In the calendar year to November, 1947, the production was 60,490,899 tons and in 1946 for the same period it was 49,132,400 tons, a gain of 23.1 per cent. Figures for the entire year are not available.

Exports had much to do with the activity of bituminous mines. Statistics are not available for the full year but for shipments made from January to October 1947, they are as in the following table:

U. S. COAL EXPORTS

(January to October, inclusive, 1947)

Destination	Anthracite	Bituminous	Coke
North and Central America	3,700,383	22,629,273	504,518
South America	27,279	2,503,406	54,109
Europe	3,384,553	31,052,327	117,372
Asia	38,799	308,107	2,584
Australia and Oceania	—	96,969	—
Africa	13,139	1,843,190	3,513
Total (January to October Inclusive)	7,164,153	58,433,272	682,076

Probably, the United States in the course of the entire year exported about 37,000,000 tons of bituminous coal to Europe, Asia, and Africa. Figures for briquetted fuel in 1947 are not available but, in 1946, the output of the 35 plants operating was 3,004,027 tons. Only 653 tons were imported and 163,339 tons were exported. Tonnage has been increasing but exports declined in 1946, probably because of exchange difficulties.

LABOR MATTERS

At the start of 1947, all the nation's coal mine workers were fully employed, for John L. Lewis, president of the United Mine Workers of America, on Dec. 7, 1946, had ordered the bituminous and lignite miners in his union to go back to work and stay there until March 31, 1947, thereby all but ordering a strike at that latter time. This he did, as a result apparently of a judgment rendered, Dec. 4, 1946, by Judge T. Alan Goldsborough, of the U. S. District Court for the District of Columbia, which judgment imposed, on Lewis, a personal fine of $10,000 and, on his union, a fine of $3,500,000, for having disobeyed a restraining order issued by the former, on Nov. 18.

The strike had lasted 17 days, but its effect had been cushioned somewhat by the fact that the anthracite mines were not involved, nor were the workers in non-union strip pits nor the members of the Progressive Mine Workers of America nor some few non-union mine workers.

The prospect of peace during 1947 was overshadowed, however, by the knowledge that the bituminous-lignitic contract, which Lewis had declared terminated, (1) might be regarded by the union as void after March 31, the usual date for such soft-coal contracts to lapse, or (2) might be voided on June 30, under the terms of the Smith-Conally Labor Disputes Act, the Government, on that date, having held the mines for a full year, or (3) might terminate at any time, prior to June 30, should the Government decide to hand over the mines to their respective owners.

The miners were known to be seeking concessions, even more generous than those provided by the so-called Krug-Lewis contract under which they were so abundantly thriving. It had been imposed on the mine operators, much to their distress, by J. A. Krug, Secretary of the Interior and Solid Fuels Administrator. The operators objected to the terms of the agreement, not so much because they feared for their immediate profits and cash balances, which readily could be made secure by increased prices, but because they well knew that the high wages and liberal concessions thus granted would be a basis for a still higher increase in wages and privileges when future contracts had to be signed. In consequence, they visualized a wage structure that would make coal prices so high that the industry could not survive, being exposed to competition from rival fuels, competition that they, the operators, already had not been able to meet successfully and could certainly not meet when the demand for fuel in the United States and Europe should decline.

MECHANICAL ADVANCES

When the shuttle car with its rubber-tired wheels was introduced into underground bituminous coal mines, it displaced the tracks at the mine face and foreshadowed further advances in trackless face operations. This has gradually come about, though more such mines have room tracks than have the newer auto-truck service. Now, it appears that all facilities at the face will run on tires, including loaders, cutters, supply trucks, drilling machines, and the newest of innovations, the timbering machine. Many of them do so already.

However, another development may displace many of these rubber-tired machines, namely, the introduction of a system of mining with an all-purpose machine that will not leave a mine chamber until the pillars have been drawn. This machine will cut the face and drill it for shooting or break it down without shooting, will load the coal on a conveyor, will help to cross-timber the roof, and do anything else that may be necessary.

A piece of equipment known as a Shortwaloader undercuts the face like any ordinary shortwall cutter, but does it with a cutter bar of about twice the length of that provided with the usual shortwall machine. However, it cuts only to the usual depth. Then, the machine pulls away from the face and moves back to the original position, and the coal face is shot. All this is preliminary to the machine's first cycle of operation. Then the Shortwaloader moves across the face cutting a swath to usual depth as it goes. Meantime, two loading bars, half the length of the cutter bar and operating much as the cutter does, pull the product away from the fallen mass of coal at the face and deliver it to a room conveyor which in turn carries it to a car or to a heading conveyor. Thus, provision is made in one unit for both cutting and loading and in a smaller degree for transportation also.

New arrivals among all-purpose machines are (1) the Julian, or Crawford, machine which has, near its base (a) two undercutting units, each of which makes a quarter segment under the coal meeting in the center line of the heading to make a full semicircle cut, (b) two picks at the top to bring the coal down, and (c) a conveyor to take the coal away; (2) the machine designed by K. L. Konnerth, assistant to the president, H. C. Frick Coke Co., Pittsburgh, Pa., which is still in the experimental stage. It undercuts the coal with a pear-shaped cutter bar and uses pressure and the vibration of hammer blows (1,000 to 2,000 per minute) to bring the coal down. As the coal falls, the machine scoops it up and carries it away. The Konnerth machine is planned to move itself across the face by ropes and jacks like a shortwall cutter. Note that the machine is sponsored by the same steel-company affiliate as was the O'Toole machine. The finer the coal, the better suited for coke-making.

The coal planer or plow is used in a modified longwall face of great length, the plane being pulled along the bottom third or two-thirds of the coal bed, parallel to a conveyor into which the plane discharges the coal as it is cut. The plane cuts a swath 12 in. deep into the 670-ft. face and pushes the coal thus dislodged into the conveyor. The rest of the slice between plow and top of coal may fall likewise, but it may hang instead and have to be dislodged by crowbars and loaded on the return trip. It may not work as well here as in Germany, for anthracite is far less easy to cut than German coal.

TIMBERING IMPROVEMENTS

Another pressing problem in underground operation has been the placement of temporary timbers at the mine faces in such a manner as to save time and also afford maximum safety, despite the length and width of the space needed for the maneuvering of the huge machines now employed. After the machines have moved forward, posts can be set which will support the roof even more effectually, but that is impossible so long as machines are working at the face.

As 60 per cent of the fatalities at coal mines result from roof falls, timbering is one of mining's most baffling problems, to say nothing regarding the delays which the setting of timbers involves, the dangers also of such delays, and the costs thus incurred. Mechanical loading with its space needs, its noise that deadens the sound which a strained roof will emit, and the rush and mental absorption of the employees, has increased roof hazards materially.

At first, it seemed that reliance must be placed today on long timbers or metal beams supported either on posts at the ribs or resting in notches cut in coal or slate. Posts, however, (1) interfere with the machine, making difficult the final clean up of the fallen coal in the place, (2) may be knocked out by the mechanical loader's shovel or claws or by the shuttle cars, and (3) notches in the rib for beam support are not easily made, except by the introduction of another machine, with still more complication and delays, all of which spell loss of time and danger. Heavy pins that serve as brackets are driven into drillholes sunk by the same machine as is used to bore holes for shooting, which machine, however, is equipped with augers of less diameter and length when it has to be used for this special service. The pins serve the purpose almost as well as the more elaborate notches, and are easier to make because they can be drilled.

At Arkwright Mine, of the Consolidation Coal Co., Morgantown, W. Va., where the valueless roaf coal (8 to 12 in. thick), the draw slate (1 to 3 ft. thick) and the "wild" coal (8 to 12 in. thick) all need immediate support, if not taken down, steel pins (1½ in. in diameter and 15 in. long) are placed in the coal rib in holes drilled 2 ft. above the floor, so that they will project 1 to 4 in. from the rib. They serve as seats for pole-like steel jacks which, resting on their inverted U bases, support in turn the cross timbers by which the menacing roof is temporarily to be supported. Five wood cross beams are always positioned in front of the face, being moved forward, one by one, as the face is advanced.

In Federal No. 1 Mine, of the Eastern Gas & Fuel Associates, Grant Town, W. Va., steel pins are placed under the end of the center line of each cross beam, and a mine tie is laid on pairs of such pins. Two cross beams rest on the two ends of the opposing ties, being laid on them, immediately over the ends of the pins. Six cross beams are kept in front of each face. Sometimes, however, the pins are set at the middle of the coal bed and screw jacks are then set between pin and cross beam, much as at the Arkwright Mine.

At Ebensburg, No. 1 Mine, of the Ebensburg Coal Co., Culver, Pa., two holes are drilled near the roof near each other and a 1¼ in. pin, shaped like a bridle enters both holes and between the holes supports one end of a steel cross beam. Several variations have been devised at the many mines where pin supports have come into favor.

But all this has not met the difficulty that long cross beams are heavy and require many men to put them in place. The first proviso was to use lighter materials, and several aluminum beams have been used wherever long beams have been needed. These beams are expensive, but after all, only a few such beams are used in any working face, as they can be moved up and replaced by posts as the working face advances. Screw jacks also occasionally are made of aluminum.

However, quite recently mechanical timbering devices have been introduced. Of these, there are many kinds, some of crude design. A modern type has (1) an automatic hydraulically driven cable reel to supply power for locomotion for spotting the beam and for sawing the timber to the required length, (2) a telescoping jack that lifts the timber and holds it in place, (3) room on the truck for a day's timber supply, (4) a 24-in. circular saw for cutting posts and beams, and (5) a second jack which can be extended to the mine floor, if necessary, to prevent the tilting of the mechanism. Another machine has two pivoted arms in place of the jack which, when raised, lift the timber to any level desired. The employment of from one to four men in a timbering crew can be saved by such timbering devices.

MINING CONGRESS ACTIVITY

As in Great Britain, so in the United States, committees have been formed to study operational methods and to report on them. This is being done here under the aegis of American Mining Congress. These committees are studying (1) conveyor mining, (2) haulage roads, (3) mechanical loading, (4) power, (5) roof action, (6) safety, (7) surface preparation, and (8) ventilation. Two of these committees, (3) and (5), have combined to study (9) pillar recovery. The suggestion has been made that speedy extraction is desirable with a weak roof and a slower extraction with a stronger roof, but the strength of the immediate, or lower, roof, or "ceiling," whatever it should be termed, is usually the only matter considered until, under undue weight, the pillars collapse, and a bump or coal burst occurs. No artificial support, says the report, can prevent the movement of the main roof; complete backfilling only limits it and makes it more regular and less evident on the surface. At a mine in Illinois with a strong main roof and a thick but weak ceiling, an effort is being made to hold the ceiling by hanger rods anchored with expansion sleeves to a strong overlying stratum.

VENTILATION

As it has been found that an ignition of methane often is a prelude to a coal-dust explosion and that methane renders rock dust less potent as a means of controlling coal-dust explosions when they occur, interest in ventilation is increasing. Many mines are returning the air from their live workings through abandoned sections (goaf) so as to keep the methanized air as far as possible from sparking trolley wires and to carry the air back toward the surface with less resistance. So-called "bleeder headings" for removing the air from the goaf are driven on three sides of that area to bleed off the air from these abandoned areas to the untraveled return headings of the main level entries.

In some instances, it is necessary to erect temporary stoppings and, for this, 4x8x16-in. cement-blocks with tongue-and-groove ends are used to make a 4-in. wall. A thin spread of weak mortar is laid on the horizontal joints and then one side of the wall is plastered, also with thin mortar. Where a section of wall, still more impermanent, is desired, as for the passage of a pan line through the wall, it is laid without broken joints and with ¾-in. wooden strips at the ends and, when the pan line is installed, a thick brattice is hung from a crossbar laid over the section when the stopping is constructed. The blocks can be used four or five times.

A plastic film, such as was used by the Navy to protect airplanes, anti-aircraft guns, naval vessels and machine tools has recently been applied by spraying to a leaky stopping by the Lorado Coal Mining Co., Lorado, W. Va. Two films were used, one containing a webbing agent which produced long cobweb-like filaments that adhered to the stopping and then one without the agent that converted the web into an even film. Being very flexible, the film will stretch about three times its length and still be airtight. Its tensile strength is 1,750 to 2,000 lb. per square inch, and mildew, many molds, salts and acids do not attack it. Unfortunately, its solvents are flammable and open lights must be kept away until sometime after the job is completed. Application to mine equipment, overcasts and curtain walls is suggested.

In methanous mines, at the end of every working place, a row of posts supports a strip of wood near the roof from which is suspended a line of brattice cloth reaching to the floor. This so divides the place that the air can be compelled to travel up to the face and back again. Instead of posts, a line of spads recently has been used over which the line of brattice cloth is laid and held by nails which are thrust through the cloth about an inch from its upper edge. The brattice cloth can be attached in the same way at its lower edge or for other applications, its edges also.

At the Lancashire No. 15 mine, Barnes & Tucker Co., Barnesboro, Pa., undercasts have been used where the air had to cross a heading in which a belt was operating. Common enough in Europe, they are almost unknown here. Barnes & Tucker proved them to be successful and much less expensive than overcasts.

When Willow Grove No. 10 Mine,

Hanna Coal Co. of Ohio, near St. Clairsville, O., put in a new shaft for the entry of men, it was necessary to screen the haulway or the air would pass down the shaft into the mine. Accordingly, a collapsible revolving door was provided to permit of the entry of persons without the admission of air. The shaft is 175 ft. deep, so the roof pressures on the frame of the door are not extreme.

SHAFT SINKING

For better ventilation, greater safety and to shorten the underground-travel time of employees, which is important now that such time, under the portal-to-portal provision, has to be compensated. At the Hubbard mine, Greensburg-Connellsville Coal Co., McKeesport, Pa., for instance, underground travel time has been shortened 1¾ hours. At this mine, the main haul is over 4½ miles long, and the employees have been spending 2 hours and 12 minutes on their way to and from work. The old fan was driven by a 150-hp. motor at a 5.5-in. water gage, a high pressure for an American coal mine. Now two propeller fans, with 60- and 25-hp. motors respectively, will ventilate the mine at a water gage of 1.5 in., reducing the horsepower to be imposed on the air 61.3 per cent.

Vesta No. 5 mine, Jones & Laughlin Steel Corporation, Fredericktown, Pa. which will ultimately take over the operations of Vesta No. 4 is being reconstructed and a shaft, 550 ft. deep, is to be constructed when the mine has progressed sufficiently beyond that point. The length of the main haul in No. 4 to the slope bottom is 10 mi., but to reach it from No. 5 portal is only 7 mi., because the Monongahela River on the banks of which both mine mouths are located puts in a deep salient on the flank of No. 4. Ultimately, the length of the main haul will be 12 mi. and to the remotest corner will be 13 mi. A distance of 2 mi. between shafts is the Vesta standard. In aggregate, in Vesta Nos. 4 and 5, there are no less than six shafts, three for air, one for slate and two more, each of which is for passage of both men and supplies. Another shaft, either completed or nearly completed, the Greenlee, is for air, men and supplies, and yet, as stated, the plans for reconstruction call for a future shaft 550 ft. deep toward the rear of the property.

SAFETY PRECAUTIONS

Six disasters in 1947, each causing more than five deaths, include the following: Jan. 15, Nottingham colliery, Glen Alden Coal Co., Plymouth, Pa., 15 men killed, methane explosion; March 25, No. 5 mine, Centralia Coal Co., Centralia, Ill., 111 men, coal-dust explosion; April 10, Schooley colliery, Panzitta Coal Co., Exeter, Pa. 9 men, methane explosion; April 30, Spring Hill mine, Terre Haute, Ind., 8 men, explosion; July 24 No. 8 mine, Old Ben Coal Corp., West Frankfort, Ill., 27 men, methane explosion; Dec. 11, Franklin colliery, Lehigh Valley Coal Co., Wilkes Barre, Pa., 8 men, methane explosion. In the case of the Centralia Coal Co., the owners were fined $1,000 on charges of "wilful neglect," July 8. The Spring Hill mine had been closed down on orders of the Secretary of the Interior. An air shaft was being sunk and other corrective work done when the explosion occurred.

To increase safety in operation at Royalton Mine, No. 7, Franklin County Coal Corp., Royalton, Ill., vertical holes have been drilled from the surface into old workings, so that the methane there generated can pass out to the external atmosphere direct and promptly rather than slowly by way of live operations, where men and locomotives are present. Like many other companies, it has replaced tracks and mine cars at the face by shuttle-car haulage, thus keeping trolley locomotives away from the major sources of methane. Instead of using explosives for bringing down the coal, high-pressure air has been substituted.

Because of the drill holes, any leakage of air into old workings sweeps the methane out of the abandoned workings and to the surface, *via* these holes which are of 6 in. diameter. In each hole is a 4-in. pipe encased in cement mortar, which pipe extends 20 ft. above ground with a solid cap at the end. The last 3-ft. section is perforated with ¼-in. holes. A copious flow of methane leaves the pipe, especially at times of lowering barometer when the air in the mine expands rapidly. Now, near the abandoned areas, the air never contains enough methane to cause a safety lamp to show a methane cap, and percentages of methane in the return air have been reduced 70 per cent. Eventually, every sealed area will be provided with at least one vent pipe—a worthwhile innovation.

Shooting several shots at the same time is a safe and desirable practice, but it has been disapproved by the U. S. Bureau of Mines Code, because until recently, every method that pronounced itself absolutely synchronous resulted in shots that were exploded at different times as measured in milli-seconds. In that brief period, some coal might have detached itself and weakened a wall of another, and later, shot in one or more directions and an ignition might result from the escape of uncontained flame.

The Bureau, in R.I. 4136, announced, Nov. 6, 1947, that its engineers had designed a multi-shot blasting unit which could be designated "permissible" and yet one that would fire ten detonators in series. Known as of a "capacity-battery type," it can be used with either battery or generator. Tested at the Bruceton (Pa.) Experimental Mine it appears that, with a current of 50 volts or less, a multiple shot fired with such a battery would not ignite an 8-per cent mixture of methane and air. A cap-lamp battery producing a 4-volt current or less proves a reliable source of energy for the unit.

Several single shots generate more noxious gases and put more dust in suspension than would a multiple shot, which latter shot would also require less powder. Firing one shot at a time reduces speed of operation, because the fumes and poisonous gases have to be carried away between shots, and an examination of the roof must be made by the shotfirer for his own protection and a safety-lamp test made of the air to assure him that its methane content is low enough that it will not ignite or explode.

PREPARATION OF COAL

The preparation committee of the American Mining Congress is tackling "full-seam mining," in which all that comes in mining goes to the preparation plant—coal, bone, pyrite and shale. Less selection of good from bad at the face and greater convenience in loading are matched against more material to transport and more cleaning in the preparation plant. Then also, it is necessary to consider whether the coal will be as clean with full-seam mining as with more preparation at the room face and closer selection as to what coal should be loaded and what left.

New types of equipment are invading the coal-preparation field. The Hudson Coal Co. at its Powderly Colliery, near Carbondale, Pa. has introduced 48 Humphreys' spiral concentrators, which equipment has been quite successful in cleaning heavy minerals, but has never before been tried as a means of cleaning coal. At Powderly Colliery, the plant cleans 750 tons of anthracite daily, 75 to 85 per cent of which passes through a 28-mesh screen. Some of the coal comes from storage and some from the thickener underflow of the Powderly plant. Nothing coarser than 3/16 in. is treated in these concentrators.

An oil-flotation plant at No. 7 colliery, Susquehanna Collieries, Nanticoke, Pa., put in commercial operation in February 1947, is cleaning, in 18 Steffensen flotation cells with light-fuel and pine oils, 320 tons daily of minus 28-mesh silt of which 65 per cent is recovered with 13 to 14 per cent of ash. At the Pittsburgh-Consolidation Coal Co.'s Champion No. 1

plant, Champion, Pa., a heavy-medium cleaning pilot plant is operating. Magnetite in water is that medium. To remove the magnetite in the washings, which consist of water, magnetite, fine coal and fine refuse, these washings are passed through magnetizing blocks, which concentrate the solids into flocs. The magnetite is then removed from the thickened washings by magnetic separators and passed through a demagnetizing coil to deflocculate the material, thus making it ready for reuse.

Four washeries are using Baum jigs so designed as to fill the interstitial spaces in the jig bed with ⅛x0-in. coal, thus providing heavy-medium washing. They give, it is said, recoveries at least equaling those shown possible by laboratory float-and-sink tests. A type of jig stroke is provided in which the entire separation occurs in the suction stroke, which holding the medium in the bed prevents the jig from washing it over with the larger coal. This medium is obtained by screening and crushing the product of the last refuse elevator and feeding to the washer the ⅛x0-in. product thereby resulting. The float in the first compartment automatically rejects any excess.

More and more coal is being recovered from mine and tipple refuse. To clean such coal in one Winding Gulf operation, all the plus 3-in. refuse was crushed to minus 3-in., thus splitting the coal from the bone. This product was washed in an 8-ft. Menzies cone with 3x½-in. coal. The Hydroseparator was used to clean the 3x½-in. refuse from this cone. The product, which contained 20 per cent ash was sent to the power plant. This practice displaced nine slate pickers.

Operating a Crescent washer with calcium chloride as heavy medium, though fireclay and garden soil also can be used, the Six K Coal Corporation plant, Clarksburg, W. V., has been preparing picking-table refuse, road cleanings and bank material for market, so effectively that the product equals or excels its natural deep-mine output.

STRIPPING PROGRESS

Many earth-moving contractors—road makers, foundation excavators, etc.—were attracted to the coal-stripping industry during the war, their own particular branch of earth moving having failed them. They had no previous stripping experience and no big excavators, and accordingly they went to the work with a prejudice in favor of the tools they had available, but they made good and have given the industry many new ideas. One would hardly have anticipated the boldness and success with which they assailed deep cuts with small machinery. For the most part, they chose the jobs with light cover—outcrop strippings—and becoming bolder tackled even deeper cover, but almost always they chose places where they had easy access to areas suitable for depositing spoil.

At Clarksburg, W. Va., a 10-ft. bed of outcropping steam coal, lying under up to 60 ft. of cover, consisting of both earth and rock, is being stripped by bulldozers and diesel-powered tractors. The crawler tractors also push back the earth they have carried. At Punxsutawney, Pa., 62 ft. of cover is the maximum. There crawler-mounted tractors and rubber-tired scrapers and bulldozers are used, but the rock is not hard and the outcrop not far distant.

At another stripping, this one in Ohio, the yawning space left when the 3 to 6 ft. of stripped coal has been loaded out, is overfilled with spoil to a depth of 12 ft. to form a berm, or platform, from which the stripper's 2½-cu. yd. diesel shovel can operate. Though the shovel has a boom only 45 ft. long, it can remove 45 ft. of cover, because the berm is at a higher level than the top of the coal.

But perhaps a strip pit at Big Horn, 12 mi. east of Sheridan in the Powder River field of Wyoming is the most amazing of all strippings with light equipment. This is not an outcrop stripping. Two sub-bituminous coal beds each 10 ft. thick separated by a foot of barren material are covered by 30 ft. of tough springy gray shale, and over that lies a bed of scoriae from the burning of an upper coal bed and from the dehydration of the shale cover that resulted. The total overburden is 55 to 85 ft. thick and the pit includes in its equipment only a single shovel which, with only a 3-cu. yd. dipper, loads the coal and most of the shale. There are also Tournapulls, caterpillar tractors, rooters, trucks and the like that transport the spoil and the rest of the shale. This equipment will be returned to construction work, and a diesel-powered walking dragline will replace it, but meantime it has shown what such small units can do. Of course, scoriae are easily scraped, the coal beds are thick and markets favorably located, but such an operation nevertheless is phenomenal.

Forty-cu.yd. shovels are still the largest in the strip-pit fields, doubtless the largest in the entire world, though the 50-cu.yd. shovel is likely at any time to emerge from the drafting board, a shovel that with one gulp will take a chunk of earth 11x11x11 ft. At least, three 40-cu.yd. buckets were installed in 1947. A 30-cu.yd. dragline bucket, said to be the world's largest, was put in service by the Northern Illinois Coal Co., Wilmington, Ill. Draglines have such long booms (150 to 200 ft. long) that their bucket sizes have lagged, and will lag, behind those of the shovels, the booms of which never exceed a length of 120 ft.

One strip mine has installed a tower excavator to reduce the height from which the shovel must take its spoil and to increase the distance the upper cover is transported, and thereby reduce both high-wall and spoil slides. The tower excavator consists of a drag scraper traveling between two self-propelling towers, one on the bank beyond the high wall and one well back on the spoil. The scraper cuts down into the bank, carries the surface material over to a point toward the rear of the spoil and dumps it there, reducing the height of the high wall and so fitting the height of that wall to the capacity of the shovel.

In the Mansfield area of Arkansas, a stripping exposes three benches of coal successively. The lowest of these benches, 2 ft. thick, is not shot but is broken apart by a scissors device termed an "air breaker." The lower end of the tightly closed shears is thrust to the bottom of a 3½-in. hole drilled vertically into the coal bench. The top ends of the scissors' legs above the pivot are then thrust apart by admitting air at 90- to 120-lb. pressure behind a piston in a cylinder of 10-in. diameter and 12-in. long, thus opening the shears. The legs below the pivot are thus also thrust apart, breaking down the coal. As two men can "air-break" 600 tons of coal daily, a big saving over powder shooting is attained.

STRIPPING LEGISLATION

Despite proofs that bituminous strippings in the not-so-long run revive and beautify rather than destroy land, anti-stripping bills were numerous in 1947, spurred by the activity of this branch of the coal industry during the war and thereafter. Stripping mines now produce nearly 20 per cent of the coal tonnage, and the appearance of strippings immediately, and for some time after completion, is distressing because the top soil no longer has either nitrogen or seeds for the re-creation of vegetal life.

At the turn of the year, the attorney-general of the State of Indiana ruled that the county planning commission of Daviess County could not be given the desired authority over mining licenses superseding the state statutes. Had the Daviess County commission been successful, other commissions in Indiana might have followed suit.

An amendment to the State Senate bill No. 17 prohibited any ordinance, which, outside urban areas, would prevent the owner from alienating or making a complete use of any mineral resources or forests. During a hearing by the State House, the operators declared that mining would extract more value from the land in a few months than the farmers would in 300 years, rich as the soil is at the junction of the overflowing forks of the White River.

An Ohio stripping bill, after receiving 14 months of study by a special commission, was introduced in the legislature of that state, Jan. 11, 1947, and was then made even more drastic and finally was whittled down, passed and signed, June 28. It provides for (1) the licensing of all operators who mine more than 250 tons a year, (2) the posting of a bond of $100 an acre to guarantee compliance with restoration provisions, (3) the leveling of spoil-bank peaks to a top width of 15 ft., (4) the covering of all exposed coal with 15 ft. of cover, (5) the sealing of all breakthroughs into underground workings and (6) the planting of trees, grasses and shrubs at a cost not to exceed $50 per acre, unless the director of the agricultural experiment station decides the land is of no value and need not be restored.

On June 30, 1947, Governor Duff signed the Pennsylvania Anthracite Strip Mining Law. A license fee of $25 has to be paid per acre for the area which the stripper expects to uncover during the year ahead. In no case shall this be less than $100. The fee is not recoverable. He must also file a bond with the Department of Mines for $200 per acre (minimum bond $2,000) as a guarantee that the ground will be backfilled for 75 ft. from the centerline of any public highway, 200 ft. from any dwelling and also enough to cover any exposed coal bed.

Peaks and ridges of all spoil banks are to be so leveled and rounded that trees, shrubs and grasses can be planted on them. This must be done within a year. The stripper may arrange to do the planting himself or he may pay the Department of Forests and Waters to do it for $60 per acre, with the understanding that he will not be asked to pay more if the work can not be done for $60.

RESEARCH

Four highlights in the research history of 1947 were (1) gasification of coal in tests made in its natural bed at Gorgas, Ala., (2) the letting of a contract for a $500,000 pilot plant at Library, Pa. by the Pittsburgh Consolidation Coal Co., to be used for coal gasification, (3) the assurance that a Federal Anthracite Laboratory would be completed by about July, 1948, and (4) the preparations for the establishment by the Government of a coal-to-oil plant at Louisiana, Mo.

The experiment at Gorgas was made in the Pratt coal, a good coking bed, 35 in. thick and practically level, underlying an irregular hilltop, measuring 350x450 ft. Two trenches were cut in the 20-ft. cover over the coal bed and, in each trench, the coal was removed for a width of 6 ft., thus simulating a 6-ft. heading. One "heading" was 143 ft. long and the other 171 ft. On the inby end, a crosscut similarly was trenched joining the "headings" and creating a pillar, 150 ft. long and 40-ft. wide. The headings and crosscut were narrowed by depositing bags of rock dust on the outer edges of these passages so as to reduce the "heading" width to 2 ft., thus speeding the flow of the combustion gases and preventing the fire from passing to the rest of the coal in the hillock. Five rows of four drillholes were sunk through the cover to the coal bed at 10-ft. centers and lined with 4-in. pipe. The pillar coal was ignited, Jan. 21, 1947 by dropping a Thermit bomb down one of the boreholes in the crosscut where the coal had been broken and where other Thermit bombs had been planted. Air and gas were circulated through this "mine" and the ventilation was reversed periodically.

The following conclusions were reached: (1) that combustion can be maintained, using up nearly all the oxygen, in a passage 300 ft. long or less, (2) that the precombustion coke is suitable for making producer or water gas, (3) that there is little or no loss in underground gasification, (4) that for best results, higher temperatures over wide areas are needed to get gas of maximum heat content, (5) that falls of roof after burning do not stop air flow or combustion but boost back pressure on the blower. Heating value of the gas averaged 45.6 B.t.u. per cubic foot when only air is supplied and usually more than 200 B.t.u. during steam runs. Sometimes the gases approached 290 B.t.u. per cubic ft. Tests were made with air, oxygen-enriched air, air-oxygen-steam, oxygen-steam and steam alone. It is estimated that 236 tons of coal burned completely and 164 tons coked. Coke appeared only where combustion was arrested.

The pilot plant project Library which is designed to produce 1,000,000 cu. ft. of synthesis gas daily is a joint operation with the Standard Oil Development Co.

Anthracite Laboratory near Schuylkill Haven is a $450,000 project dates back to 1942 when Congress in Public Law 812 authorized the erection of the building, but the war intervened. On Jan. 10, 1947, Secretary Krug announced Hazleton as the site. A disagreement as to this decision arose and the House of Representatives on April 26 voted to eliminate the appropriation, but later in the year, it was announced that the site would be near Schuylkill Haven, that Congress had appropriated $175,000 for the first year's maintenance, staff salaries and research and that the building would probably be completed by July 1948.

At Louisiana, Mo., where the U. S. Government has its Missouri Ordnance Works, the Department of the Interior, in the late winter of 1946-1947, let contracts for the design and construction of a pilot plant to study and demonstrate the conversion of coal into oil. This plant should be in operation in midsummer of 1948. About 200 bbl. of oil or gasoline would be made daily. The U. S. Bureau of Mines in the fall of 1947 sent to this plant, for the production of synthetic fuels, equipment which the Germans had used in the war. With it were sent for test also German-made catalytic materials. The shipments include a 130-ton hydrogenation-process converter, a 60-ton "wickel ofen" heat exchanger, two 30-ton paste injectors and a Linde-Frankl oxygen-plant unit.

Prospects for an early development of an industry devoted to turning coal into oil are brightening. Secretary of Interior Krug in his February report to Congress declared that the estimated cost of producing gasoline from either coal or oil shale was 7½ to 9½c. per gallon. Gasoline is obtained from petroleum at a cost only a little lower.

At the University of Utah, a new coking briquet is being made of powdered Utah coal with pitch as a binder. This should aid in the problem of obtaining coke in Utah, most of the coal in that state not being suitable for making that product. In August, the Utah Chemical & Carbon Co. announced its intended construction of a $1,400,000 smokeless-fuel plant to process 400 tons of coal daily and to make plastics, varnish, chemicals, aspirin and nylon. Utah's coals are all very smoky bituminous fuels. Lignite, which usually makes no smoke is not available. So, Utah has always actively sought some way of creating a smokeless fuel.

NON-FERROUS METALS

By DONALD M. LIDDELL
CONSULTING ENGINEER, NEW YORK

GENERAL

The feature of the American non-ferrous metal markets in 1947 was the belated passing of the OPA (Office of Price Administration) and the abolition of premium prices. The latter legally expired on July 1, but a bill was immediately introduced to continue them for two years (H.R. 1602), and was passed by the Senate in the closing days of July. On Aug. 8, President Truman vetoed the measure, giving as his reason that the premium price plan could not be regarded as a permanent part of our economy, and that it could be more readily abolished during a time of high employment and great business activity with less economic dislocation than it could later. The Joplin district showed the most striking effects, 30 properties being closed over night.

It is interesting at this time to look back on the two world wars and observe the contrast in metal prices and demands. By the end of 14 months after hostilities ended in the First World War, unmanageable stocks of the metals had begun to build up, and, to take a specific case, by 1921 the Copper Export Association had to borrow $40,000,000 with 400,000,000 lb. of copper as collateral, and the notes went below par at that, showing a lack of confidence in their backing. But again, taking the same metal as an example, the Government ended the Second World War with a stockpile of 543,000 tons, and at the end of August, 1947, 532,000 tons had been given to and absorbed by industry.

In general the situation in most of the non-ferrous metals is tight (and the same can also be said of the ferrous group), and if the Marshall plan is carried through, which means supplying the means to the Western European governments to bid against us in our own and foreign markets, there seems to be no reason to anticipate anything but high prices and short supplies for a long time to come.

ALUMINUM

The aluminum industry of the United States remains in the hands of the Aluminum Co. of America, with a potential capacity of over 425,000 tons, of which probably 325,000 tons are commercially economic; Reynolds Metal Co., probably 200,000 tons; and Kaiser-Frazier, probably 120,000 tons. Aluminium, Ltd., of Canada, probably has a potential capacity of 500,000 tons per annum, and is probably the cheapest producer in the world.

In spite of all the good publicity given the efforts to extract alumina from the low grade bauxites and other aluminous materials during the war, the sad fact remains that most of our aluminum output is derived from South American ore.

Unfortunately it appears true that the known world reserves of high grade bauxite bear a smaller ratio to the annual production of aluminum metal than do the reserves of any other of the large tonnage metals. It is an interesting fact that aluminum, though not so great in tonnage as others of the nonferrous metals, appears to be the second metal in yearly bulk, being outranked only by steel.

The U. S. price remained throughout the year at 15c. per lb. for 99 per cent metal in ingots; 14c. in pigs. The British home market price opened at £72.15s. per long ton, and was advanced to £80 on March 24, 1947, where it has remained steady.

United States and Canadian production in 1946 was 547,114 tons, down from a war peak (1943) of 1,284,530 tons. The production for 1947 was higher, probably 820,000 tons, with Canada supplying somewhat over 250,000 tons.

Reynolds Metal closed the Longview, Wash. plant, in May, for about a year, and also served notice on the War Assets Administration that it did not wish to operate the government built rod and bar mill near Newark, O.

The tariff on bauxite was reduced in 1947 from $1 to 50c. per ton, and on aluminum from 3c. to 2c. per lb.

COPPER

The world production of copper, excluding China, Cyprus, U.S.S.R. and Yugoslavia, was 1,720,402 tons in 1946 (compared with outputs exceeding this figure from North and South America alone during the war) and will probably be about 1,900,000 tons for 1947, in spite of the crippling effect of strikes in the United States, Chile, and Mexico.

Important potential mining and smelting capacity was developed during the year at the South African mines, and, in the United States, progress of the development of the San Manuel property of Magma Copper Co. and the announcement of a great program for the treatment of low grade ores of the Butte district by the Anaconda Copper Mining Co. are important from the viewpoint of the future. The old Tsumeb property of the Otavi Mining and Railway Co. in Southwest Africa, idle since 1939, will also add some new copper production in the near future. For a time, at least, this property will ship concentrates to Antwerp, where they will be smelted.

The year opened with American copper selling at 19.275c., f.o.b. Connecticut Valley points in the United States; at 11.55c. for Canadian copper f.o.b. Toronto or Montreal; and at £127 in London. This starvation policy for Canada was somewhat mitigated by the Canadian authorities in January 1947, when the price was raised to 16.625c. (still well below the United States level). On June 9, ceiling prices were removed in Canada so that copper immediately moved up to the world level.

In the first week of April the Ministry of Supply in Great Britain raised the British price to £137 per gross ton (equivalent to 24.62c. per lb.), contrasting with the 22½ to 23c. f.a.s. New York being quoted for foreign shipments and a price of 21½c. being quoted for domestic.

By mid-May the American export price was 23.675c., but by June 1 the export market was definitely back to 22¾c. and the domestic to 21.6c.

On March 12, the House of Representatives voted to suspend the duty on copper until March 31, 1949, the bill finally going to the President for signature April 21.

On July 14, the British cut the price of copper in London to £132 per ton (23.73c. per lb.), and it ended the year at that figure, with domestic prices down to 21.2c. and foreign export at 21.425c.

The dissipation of the 543,000-ton stock of copper held by the Government at the close of the war has already been commented on. In this world of suspicion it appears that national security demands a copper stockpile, unless we are going to forget every lesson of the last 30 years, so that here is a potential demand that should exercise a stabilizing influence on copper, even if European demand goes flat.

It is interesting to note that Kennecott Copper is the largest gold producer in the United States, 155,749 oz. in 1946.

LEAD

The abolition of premium-subsidy prices during 1947 has already been commented on, though lead has furnished its own subsidy by going to a new high price in cents per pound. The year began with lead at 12.35c. per lb., East St. Louis, which was advanced by small steps until, by March 6, when it was set at 14.8c. St. Louis, where it remained for the rest of the year. In Canada the price was raised in January from 5c. to 10.625c., and its ceiling price removed on June 9, the price immediately rising to 14 to 14¼c. In London, the year opened with foreign soft lead at £70 per gross ton (12.56c. per lb.), but at the end of March this was advanced to £90 per ton (16.15c. per lb.), where it has since remained.

What the production of lead was in 1946 is not too accurately known even now. Totally omitting any estimate for Japan, Korea, Manchuria, it was of the order of 1,050,000 tons, and, with the same omissions, it was about 1,380,000 for 1947.

In this connection there have been various statements published that St. Joseph Lead Co. is the largest producer of lead in the world. In the writer's opinion this idea is erroneous, and Consolidated Mining and Smelting Co. of Canada has that eminence, with St. Joseph second. However, if one regarded the Broken Hill (Australia) producers as a single entity, they would be second. Operations were resumed at Mt. Isa, Australia, during the year, and the O'Okiep interests are reopening the old Tsumeb property of the Otavi company in Southwest Africa, as already mentioned under "Copper." This was a German controlled company, and the property has ore of phenomenal richness (large tonnages showed over 50 per cent of usable metals, copper, zinc, and lead, as well as some minor valuable constituents). The property had been idle since 1939, and control was sold by the Alien Property Custodian of South Africa early this year. Metallurgical recoveries in the pilot plant far exceed anything attained during the old operations.

Important enough showings of lead have been found in the Uriwara district of Tanganyika to warrant an expenditure already reported at over £1,000,000. The Bawdwin mines in Burma are reported as less damaged than was at first thought, and it is believed they will shortly be running at the rate of 1,000 tons per month of lead and 70,000 oz. of silver.

Government stocks diminished from 37,000 tons on Jan. 1, 1947, to 4,653 tons on Nov. 30, 1947. The visible smelters' stocks were 176,328 tons on Dec. 31, 1946 to 24,809 tons on Nov. 30, 1947. Attention is again called to the fact that these decreases in stocks have taken place in the face of a great world production spurred by a record price. All of which reminds one that, over 20 years ago, J. R. Finlay gave a lecture on "Lead, the Coming Precious Metal."

The present tariff on lead is 1½c. per lb., but with lead at 15c. per lb. this does not look so mountainous as the tariff of 2c. did on 4 to 5c. lead.

TIN

Tin was in short supply all the year. The course of tin prices reflects this statement. The price of tin was 70c. per lb. New York on Jan. 1, 1947, and was advanced late on April 2, after the day's business was practically over, to 80c. per lb., and on Dec. 17 to 94c. per lb. This was a reflection of London, where tin was £380½ per gross ton on Jan. 1, advanced to £437 on March 29, and to £510 on Dec. 17, for 99 per cent metal, equivalent to 92c. for this grade and 94c. for Straits tin. On the last day of the year the U. S. Government agreed with the Bolivian tin producers on a price to them of 90c. per pound of contained metal in their concentrates. Production in 1946 was about 92,000 tons, of which about 37,600 tons came from Bolivia and 25,300 tons from Nigeria and Belgian Congo. Only about 18,200 tons came from the Far East, other great source of supply other than Bolivia before the Second World War and only 800 tons from Great Britain, the tin-land of the dawn of history, though England may have produced nearly 2,000 tons in 1947. Estimates of 1947 production are about 105,000 tons. The Arnhem (Netherlands) smeltery completed its rehabilitation program in January, and two great dredges were sent from the United States to the Far East early in the year, but in general it is known that the Far Eastern tin production on which the local smelteries and Arnhem depended has not come back as fast as was hoped when hostilities closed. A part of this seems to be due to a mining consideration concerning dredging areas that are approaching exhaustion. The question is whether the ground will pay for the installation of a dredge during the life of the property, even considering the later resale value of the dredge for operations elsewhere. A part seems possibly due to the governments concerned desiring to pay for war damage on the basis of the depreciated values of the equipment at the time of destruction, and a feeling by the operators that replacement before settlement will be prejudicial to the owners of the property, and into this comes a question in certain areas of tariffs on the replacement equipment taking the joy out of an apparently good settlement.

In addition, there have been grave

shortages of fuel, and it has been hard to get power plant equipment to replace that destroyed by the Japanese in their co-prosperity operations; local disorder is still rife in some areas, so that recovery in the Far Eastern tin industry has been disappointingly slow.

The general tin situation has been enlivened in the United States by direct charges by the *American Metal Market* that the Office of Materials Distribution "cooked" its figures to fit its forecasts, and that the statistics had become valueless. It can only be reported, therefore, that everyone concerned seems to agree that on Jan. 1, 1947, United States stocks were as follows: Pig tin held by private industry, 14,837 tons; pig tin, government, including the Treasury stock, 29,337; government stock of concentrates, 24,642; miscellaneous stock, private hands, 9,109; total 77,925 tons. The *American Metal Market* estimates a year-end stock of 38,000 tons of pig tin in government and private hands.

ZINC

The effect on zinc of the abolition of metal premium-subsidies in the Tri-State district has already been discussed. In spite of the dwindling visible stocks of spelter both in government and private hands, the price remained throughout the year at that established in November 1946 of 10½c. East St. Louis.

The Canadian zinc producers had been, like the copper smelters, starved by governmental decree, and the price in early January 1947 was only 5.15c., f.o.b. Toronto or Montreal. In January, this price was raised to 10¼c., and the ceiling removed on June 9, the price of electrolytic zinc rising to 11c. The price in London was raised Jan. 1, 1947 from £55 per gross ton to £70 (12.56c. per lb.) for Prime Western, where it still remains.

As a matter of fact, the London price of 12½c. looks far more realistic than does the 10½c. East St. Louis figure, for producers claim they have a waiting list for both Prime Western and Special High Grade. Visible stocks have dropped from 176,328 tons Dec. 31, 1946 to about 59,000 at the year-end. This does not include the Metals Reserve Corporation stocks, which amounted Oct. 31 to 225,721 tons (of which however 190,706 tons was in the form of ore). On Oct. 31, it was understood that 63,386 tons of a visible stock of 129,046 tons was earmarked for the Government. Presumably a part of the decline in stocks is owing to a movement of some of this metal into the government stock, a wise precaution, if it has been taken.

The government stockpiling operations furnished one of the jokes of the year, when the Treasury invited tenders of zinc for stockpiling "at prices substantially below the present market price for zinc." Strangely enough, the Treasury was not swamped with offers.

The tariff on zinc in ores and concentrates was reduced from 1.2c. per lb. to 0.75c. during the year, and on spelter from 1.4c. to 0.875c. per lb. Imports of zinc in ore and concentrates amounted to 272,000 tons in 1946.

The world's production of zinc for 1946 was 1,410,168 tons, omitting Czechoslovakia, Japan, Manchuria, Sweden, U.S.S.R. and Yugoslavia. The comparative figure for 1947 will be about 1,550,000 tons.

NICKEL

The two most important events of 1947 dealing with nickel from the standpoint of the United States were cut in the duty of 1¼c. per pound to be effective Jan. 1, 1948 and the closing of the Nicaro Nickel Company's plant in Cuba on Feb. 1. The nickel recovery plant became the property of the U. S. Government, but it is understood that the ore remains the property of the Nicaro Nickel Co.

Canadian nickel recovery greatly increased during 1947 over 1946 and is probably back almost to the 1945 production if it is not equal to it. It is estimated that the Canadian production will be close to 116,700 tons for the year and that the world production should be close to 123,600 tons, leaving out any attempt to include Finland and the U.S.S.R.

The price of nickel for cathodes was 35c. per pound and 36c. for shot and pig made from remelted electrolytic metal. In London the price was £190-195 per long ton. Both of these prices prevailed throughout the year.

ANTIMONY

The supply of antimony is still being seriously affected by the disturbed condition of China. The price was 25.78c., f.o.b. Laredo, Tex., Jan. 1, 1947, but was advanced to 33c. per lb. March 15, at which price it ended the year. In London the price on Jan. 1, 1947 was £157½ per gross ton, moving up during the year to £180.

A great use of antimony is as an antimony-lead alloy for storage battery plates, but it has also important uses as a constituent of type metal and other alloys, as a pigment, and in rubber manufacture. There is a smeltery at Laredo, working in the main on Mexican ores; the Bunker Hill & Sullivan Mining Co. (Idaho) produces some electrolytically, and the production by the lead smelters as antimonial lead has exceeded the two combined, although Bunker Hill & Sullivan reported that in the third quarter it was running at a rate of over 500 tons of metal per month. But in 1946 we imported 2,593 tons of antimony, probably 40 per cent of our requirements (this does not include the ore treated at Laredo in the imports). The Laredo smeltery was taken over by National Lead during the year.

THORIUM AND URANIUM

About the only points to be mentioned in a brief review, pertaining to radium and thorium, are that trade in minerals containing these metals is even more hedged about by government regulation than is trade in gold; that repeated hints come through of frenzied efforts by the Russians to increase the outputs of Saxony, Silesia, and Austria of uranium ores; and that work was started on the $10,000,000 Brookhaven pile.

PETROLEUM

By Robert E. Allen

Director of Information, American Petroleum Institute

GENERAL

During 1947, petroleum continued to amaze those closest to it by an important and partly unexpected group of events and circumstances which taken together seem to indicate an acceleration in the tempo of the energy revolution that has come to the post-war United States. Demand for petroleum products during the 88th year of the industry amounted to 246,000,000 gallons daily for our 143,000,000 population. This is an increase of more that 10 per cent over 1946, nearly 10 per cent over the peak war demand, and 30 per cent over 1941, the last pre-war year, and means that we required an average of nearly seven quarts of liquid petroleum per person to provide for our comfort, our transportation, our industry, and our security.

For the first time, the economy of the United States required more than 2,100,000,000 barrels, or 90,000,000,000 gallons of oil a year, an astounding figure even in an age of superlatives. Among other things it means that we consume approximately 15 times as much oil per capita as Great Britain. This means 15 times as much efficient energy for us as for Great Britain. It means also that the 321,000,000 tons of oil and 109,000,000 tons of natural gas consumed by the United States weighed more than three times as much as the total 1947 U. S. crop of all food grains. In other words, we consume daily more than three times as much petroleum as food, because our average petroleum ration amounts to 16 pounds per capita daily. Although we are seldom as conscious of our demands for petroleum as we are of our demands for food, the closing weeks of 1947 brought a sharpened consciousness of the need for petroleum products as a combination of a transportation deficit plus the worst snow storm in 60 years resulted in a general need for reduced consumption of fuel oil for several weeks.

Although the petroleum stringency was confined to the 22 northeastern and midwestern states, its effect was felt by the entire country and by the entire petroleum industry. The steadily increasing demand for petroleum products resulting from the installation of about 750,000 new oil burners in homes and the delivery of 4,793,000 new automobiles and trucks, brought so much competition for supplies of petroleum that the 1946 trend toward higher prices became accentuated during 1947 in company with most commodity prices. Comparative prices on typical items are:

	Dec. 31, 1946	Dec. 31, 1947
36° East Texas Crude Oil, bbl.	$1.70	$2.65
#6 Fuel Oil—New York, bbl.	$1.92	$3.13
#2 Fuel Oil—New York, T. W. gal.	8.9¢	11.7¢
Kerosene New York T. W. gal.	10.3¢	13.6¢
Regular gasoline N. Y. T. W. gal.	10.6¢	13.3¢

Despite these price increases for petroleum products, they were still the cheapest essential commodity at the end of 1947, according to the U. S. Bureau of Labor Statistics. Wholesale prices of petroleum products as of that date had barely regained their base index of 100 in comparison with indices of 130-160 for most everyday necessities. The transition from one year to the next marks no significant change in the demand of the American public for new cars and trucks, new oilfired heaters, and many other oil consuming devices such as farm tractors, diesel locomotives, airplanes and even gasoline propelled wheelbarrows.

PETROLEUM TRENDS

In an industry as huge as petroleum, trends of great magnitude are sometimes almost indiscernible in the space of only a year. Significant events must be frequently scanned in lieu of definite trends. Many were the significant petroleum events of 1947. Only a few of the more notable can be listed here.

1. The establishment of new records in the production, transportation, processing, and distribution of petroleum.
2. A demand for all kinds of petroleum products that broke all previous records and showed no sign of abating.
3. The voluntary allocation of petroleum products to dealers in certain areas where transportation handicaps resulted in local shortages of various durations.
4. A ruling by the U. S. Supreme Court that the Federal Government, rather than the state, held proprietary rights on the submerged ocean-floor beyond low tide on the California coast.
5. A record importation of petroleum from Venezuela and the receipt of four cargoes of Arabian crude oil, resulting in net imports for several months.
6. The adoption of statutes promoting the unitization of oil pools in Oklahoma and the unitization of the important West Edmond field under that law.
7. The accelerating competition among buyers for crude oil and all petroleum products, resulting in a trend toward higher prices.
8. Intensive joint research by large oil and coal companies designed to provide more flexible markets and greater utility for coal and to make available supplies of synthetic petroleum.
9. An increasing cognizance of the importance of the vast oil fields of

South America and the Middle East to the American consumer of petroleum products.

10. A construction program to provide new facilities for the production of petroleum products, costing $2,000,000,000 a year and requiring much borrowed capital despite the earnings of the industry which are insufficient to meet present costs.

PETROLEUM EXPLORATION

As is always the case when prices are high enough to provide the incentive to undertake the risks of exploration, the search for oil reached new heights during 1947. At the end of the year, there were 480 geophysical and core drilling crews actively operating in 16 of the 26 oil producing states and in North Dakota.

Despite all the exploratory activity, there were no additions to the number of oil producing states during the year, and Alabama remains as the latest entrant to the group. Recent drilling in Georgia, North Carolina, Maryland, Delaware, and Washington has been unsuccessful to date although a small flow of natural gas was found by a well in Garrett County in western Maryland.

A phenomenal number of new oil and gas pools were found during the year. Something like 5,400 exploratory wells were drilled, resulting in the discovery of 1,100 new fields, zones, and extensions, and 4,300 dry holes. Although it may be three or four years before the reserves of these new discoveries are fully evaluated, it may be expected that some of them are of significant magnitude and will contribute substantially to oil reserves. Advance estimates indicate that the largest of 1947 discoveries may be a field 12 miles off the coast of Louisiana in the Gulf of Mexico. If this field contains the estimated 500,000,000 barrels, it will yield in perhaps 20 years just about enough oil to supply the United States for three months at present rates of consumption.

Ten million-barrel oilpools are now considered quite a reward for the wildcatter. Such a pool would supply enough oil to last the country for two days, but the process of recovery would require years. Since the original petroleum reserves of the United States have now been depleted by the extraction of the 35,000,000,000 barrels produced to date, it seems obvious that, until other sources of energy are available, we will become increasingly dependent on foreign supplies of crude oil. This crude oil must come from countries whose reserves are large enough to augment our own. The most likely sources of petroleum imports, which may soon reach 1,000,000 barrels daily, are Venezuela and Arabia. It seems virtually certain that the imports of 1947 will be far eclipsed by those of 1948.

The completion of several new refineries in Europe will increase the consumption of oil from the Middle East and should make that much more Venezuelan oil available for our use. In Canada, an intensive search for more oil is in progress with fair success. If Canada becomes self sufficient in oil, we will be able to make good use of the large quantities of oil we now export to our neighbor nation.

PETROLEUM PRODUCTION

According to preliminary reports, the production of crude oil in the United States amounted to 1,856,550,000 barrels in 1947, equal to 5,090,000 barrels or 213,800,000 gallons daily. The production of natural gasolines and distillates amounted to 131,150,000 barrels total, or 360,200 barrels or 15,130,000 gallons daily. The production of natural gas amounted to a total of 6,100,000,000,000 cubic feet. This quantity of gas is equivalent to 1,000,000,000 barrels of crude oil, or an average of 2,738,000 barrels or 115,000,000 gallons daily. Thus the total petroleum production of the U. S. in 1947 amounted to the equivalent of 2,987,700,000 barrels of oil, an average of 8,186,000 barrels or 344,000,000 gallons daily. This tremendous quantity was enough to supply every per-

TABLE I

[3] Preliminary, subject to revision.

son in the country with the equivalent of 2.4 gallons or 17.5 pounds daily.

The crude oil and natural gasolines, etc. above listed, plus benzol from gas works and coke plants, plus net imports, comprised the total liquid petroleum supply of the United States for 1947. This amounted to 2,141,000,000 barrels, an average of 5,867,000 barrels or 246,200,000 gallons daily. This brings the total supply of all petroleum in the United States up to the equivalent of 8,600,000 barrels or 361,400,000 gallons daily, which amounted to 2.53 gallons or 18.5 pounds per person daily. This figure clearly shows the importance of petroleum in the economy of the United States.

To produce this record quantity of petroleum, required approximately 430,000 oil and gas wells. Of these, approximately 300,000 were in the category known as stripper wells of such small production that their total production for the year amounted to only about 250,000,000 barrels or about one-seventh of our total production. This is an important seventh, however, for without it we would have had to import 250,000,000 barrels more oil without enough tankers.

Old oil and gas wells are abandoned at the rate of about 10,000 yearly in the United States. The number of unproductive new wells drilled each year totals about 11,000. It is evident, therefore, that at least 21,000 wells must be drilled yearly simply to maintain the number of wells. This in itself is an enormous undertaking, costing about $750,000,000 yearly and requiring over 1,250,000 tons of steel. However, even this number of wells will not maintain the oil production of the country, much less supply the constantly increasing demand. With only maintenance wells drilled, the average daily production of the United States would decline about 300,000 barrels. This would be a successive decline yearly. Enough new wells must be drilled to produce 110,000,000 barrels of oil each year, that is, 300,000 barrels per day, if production is to be maintained. Finally, if demand increases by 10 per cent during a year, enough additional wells must be drilled to yield the additional 200,000,000 barrels of oil required and at the same time discover enough new oil to replace all of the oil produced during that year. Thus the task of the petroleum industry is a formidable one. Providing stupendous and ever increasing quantities of petroleum for today and many tomorrows is without question a job of the first magnitude, not only for the petroleum industry but for the United States. There are grave and unmistakeable implications in the fact that,

with only six per cent of the world's population and only 30 per cent of the known reserves, we are producing and consuming two-thirds of the world's petroleum production. It is little wonder that our oil companies are intensifying their discovery and development of foreign fields as our own reserves wane.

To maintain the supply of petroleum during 1947, more than 33,600 wells were drilled. This required the operation of more than 2,000 rotary drilling rigs and an undetermined number of standard tool rigs. More than 50,000 men were directly employed in drilling operations alone. These wells required no less than 2,500,000 tons of steel pipe, plates, sheets, and structures, and cost no less than $1,200,000,000. This is only part of the cost of keeping the United States in oil. To move and process the crude oil and deliver it to the consumer requires ever-widening costs in terms of steel and capital. Many of the costs of refinery construction are now thrice as great as pre-war, and steel is in such scarce supply that many wells, pipelines, and refinery jobs have been held up for lack of steel.

With the limited steel available, many notable achievements were made in the drilling and producing fields. A new depth record of 17,823 feet was set by an expensive but unproductive test well in Caddo County, Oklahoma, and as the year ended a well in Ventura County, California was within a few hundred feet of this record and still drilling. Among the notable new fields discovered during the year, in addition to the one off the Louisiana coast, was one in west Texas and one in California, both below 12,000 feet in depth, that give promise of very substantial additions to the nation's petroleum reserves.

Despite a year of good production and good prices, the petroleum producers of the United States are becoming keenly aware that their oilfields can not produce 2,000,000,000 barrels a year indefinitely and that the discovery of a good field means just one less field left to find. Hence the interest in foreign oil.

PETROLEUM TRANSPORTATION

The key to the petroleum story of 1947 was transportation, or rather the lack of it. Though more oil was available at points of consumption than ever before, there was still insufficient gasoline and fuel oil to satisfy all

TABLE III

QUARTER-CENTURY OF PETROLEUM PROGRESS

demands during the summer and winter of 1947. This condition prevailed only through the Middle West with respect to gasoline and only in the Middle West and northeastern states with respect to fuel oil. Though the tremendous surge in demand was the basic cause of the situation and though in terms of past demand there was ample supply, it can not be denied that to a consumer there is a shortage when he can not buy all the petroleum products that he wants and is able to pay for.

Within a radius of 200 miles of New York and Chicago lie the most

TABLE IV

concentrated centers of petroleum consumption in the world. More than half of the petroleum of the country is consumed in these two areas. Only the Chicago area has petroleum production of any consequence, and it declined so much during the war that it will not begin to meet the current needs of the district. Consequently, the refineries serving the great agricultural and industrial Middle West have had to go farther for their crude oil—clear to the mountain basins of Wyoming and to the high plains of western Texas. To move huge quantities of oil economically overland, large pipelines are required, and pipelines take money, steel, and time to build. During the war, pipelines were built principally to meet military requirements, an example being the two Big-Inch pipelines which carried Texas oil to the great refineries of New Jersey that were vital to the prosecution of the war in the European theater of operations. These big pipelines were built to supplant the regular tanker routes between Texas and the East Coast that were so vulnerable to submarine attack during the war.

Submarines did not menace the many shorter pipelines that carried crude oil from the fields of Illinois, Indiana, Kansas, and Oklahoma to the refineries of the area. The rapid depletion of the oilfields of Illinois was the even greater menace which forced the refineries to go farther and farther south, west, and southwest for their supplies of crude oil and to bid for oil in competition with Gulf Coast refineries that were just as anxious to refine inland crude oil and send the products by tanker to the big cities of the Atlantic seaboard.

Although pipelines of the necessary magnitude had been projected, they were being built very slowly because of steel shortage due to the pent-up demands of U. S. industry. Consequently, when the gasoline demand began to pyramid during the plowing and planting season of 1947, it soon became apparent that there was not enough pipeline capactiy to let midwestern refineries operate at the rate required to yield all the gasoline wanted by consumers of that area. As a result, a simple and practical method of allocating limited supplies to dealers was inaugurated by suppliers serving the area, with the result that service stations were able to close earlier each day and to close on Sunday. A voluntary but practical type of rationing by retailers to consumers was the result of this allocation plan. As the year wore on, the transportation stringency, coupled with still increasing demand, resulted in a continuing deficiency of fuel oil as well

as gasoline, and this situation will continue as long into 1948 as product demand exceeds transportation capacity.

Because tanker transportation is more flexible and fully as economical as pipeline transportation, the Big Inch lines were shut down soon after the war, and tanker service from the Gulf Coast to the Atlantic seaboard were resumed. During 1947, the two big pipelines of 24 and 18 inches diameter were sold by the Federal Government to the Texas Eastern Pipeline Co. which promptly began to install the necessary compressor plants to enable the line to carry the maximum quantity of natural gas from Texas to the industrial east. The line delivered low pressure gas to Ohio and Pennsylvania during several months of 1947. Since only about 6,000 cubic feet of natural gas is needed to equal the heating value of a barrel of fuel oil, it is evident that one way to avoid future fuel shortages is to bring natural gas to New York and New England so that consumers would have their choice of petroleum fuels. Huge pipelines to bring Texas gas to New England are now projected.

For more than half of 1947, tanker transportation brought adequate supplies of Gulf Coast and Caribbean oil to the northern Atlantic states. The magnitude of this tanker movement of oil is indicated by the third quarter operations when 142,028,049 barrels of petroleum were transported from Texas and Louisiana alone to the Atlantic states. This was about 30

per cent of U. S. total production and averaged 1,544.000 barrels daily. Then the number of tankers available for charter diminished as the U. S. Maritime Commission prepared to offer U. S.-owned tankers for sale, and in the course of a few weeks in late 1947 petroleum supplies were shortened nearly 12.000.000 barrels with resulting dislocations and shortages in fuel oil supply. The record 25.8 inch snowfall of Dec. 26 aggravated the situation, but as the year ended sufficient additional tanker capactiy was becoming available to mean a more nearly balanced supply before spring.

PETROLEUM REFINING

Every gallon of petroleum products used in 1947 had to pass through a refinery or processing plant. In passing through the "magic towers" of a modern refinery, crude oil is still converted into three principal products and an increasing number of secondary products. In refining vernacular, the top of the barrel yields the gasoline for automobiles, trucks, tractors, and airplanes; the middle of the barrel yields kerosene, diesel oil, gas oil, and distillate fuels for home heating; the bottom of the barrel yields the heavy fuel oils and the asphalts. Each part of the barrel yields many other products besides those listed. but all save a small percentage of refinery revenue comes from the sale of the products mentioned.

Continuing the trend of previous years, 1947 witnessed a surge in demand for each of these principal products but particularly for the products from the middle of the barrel which are used chiefly to heat homes, fuel trains and ships, and make the better grades of gasoline. Faced with this demand for more middle of the barrel products, many refiners had to make inroads into both the top and bottom of the barrel, but the bottom of the barrel felt the effect worst. The result was relatively less heavy fuel oil for industry, large buildings, public utilities, and ships, and the inevitable rise in price that accompanies competitive bidding for a scarce commodity. Another result was that many large users of fuel, including some oil refineries, converted their operations back to coal as being the cheaper and more available of the two fuels. As the demand pressure grows for the products from the top and middle of the barrel that have no alternates available in quantity, it seems likely that heavy fuel oil will either increase in price to a figure comparable with home heating oil and gasoline or shrink still more in volume as refiners seek to move more and more of it up into the middle of the barrel.

1946[1]	67.3	120.9
1947 (Oct.)	96.5	158.5

[1] Revised.

The 363 operating refineries of the United States are so located with respect to supplies of crude oil and available markets that it is very seldom that they closely approach their total rated capacity. Yet such has been the unremitting demand for petroleum products that for months during the latter half of 1947 the record of refinery runs was broken time after time until the last week of the year when the operating refineries processed 39,460,000 barrels of crude oil at the rate of 5,637,000 barrels daily, as compared with crude oil production of 5,291,000 barrels daily during the week. This record represented 99 per cent of the total capactiy of operating refineries and was achieved by the refineries in five of the ten U. S. refinery districts operating at rates well beyond their capacity for weeks at a time. During this last week of the year, for example, the refineries of the East Coast processed 6,391,000 barrels of crude oil while operating at 111.5 per cent of capacity.

Needless to say, refineries like all other intricate mechanisms occasionally need replacements and repairs and occasionally also there is a strike or a lack of tankers that shuts down or cripples refinery operations. It is easy to see what the immediate effect would be if the shutdowns of three or four of our largest producing refineries happened to coincide at a time when stocks were low and current demand was well ahead of refinery runs. This is a danger to which the refiners are more alive than anyone else, and they are striving desperately with every means at hand to increase their ca-

pacity against the greater demands of 1948.

Included in the refinery expansion program are three plants for converting gaseous petroleum to liquid petroleum. A wide range of petro chemicals will be obtained from these plants, and their operation will open a new phase of the history of petroleum as will also the first and not far distant plant that will convert coal to synthetic liquid petroleums.

PETROLEUM DISTRIBUTION

The business of transmitting petroleum products to millions of consumers throughout the United States is one of the greatest distribution patterns known. While only one company now markets its products in every state, there are at least a dozen companies that operate in 15 or more states. In addition, there are hundreds of companies that compete for business in more localized marketing areas. This competition of the most part is for the business of the thousands of individual dealers who sell petroleum products to the public. A relatively small proportion of the total is sold direct to consumer by the refiner, and most of our service stations and fuel oil outlets are individually owned small businesses.

TABLE XV

PETROLEUM TAXES

Year	Total Taxes
1936	$1,183,147,498
1937	1,315,487,798
1938	1,286,114,473

1947[2]	2,500,000,000

[1] Revised.
[2] Preliminary, subject to revision.

The petroleum distribution facilities of the country suffered severely from the effects of the war and like other divisions of the industry that division is beset by shortages of material and high prices. Despite these difficulties, great strides were made in 1947 toward a return to the pre-war standards of service. Increased taxes, rents, and operating costs in the marketing of petroleum products in common with most retailing enterprises made necessary increased margins between the cost and retail price of many products, with the result that still another item of increased cost had to be passed on to the consumers, who on the whole, had more money with which to buy.

Coincident with the marked increase in farm incomes came a great demand from the farmers for petroleum consuming devices to increase their productivity and improve their comforts. This remarkable expansion of the farm market for petroleum is one of the most notable characteristics of the agricultural revolution through which the nation is passing. Farmers are now estimated to be the consumers of 24 per cent of petroleum products and are rapidly becoming a big factor in the consumption of home heating oil as well as gasoline.

Prominent agricultural authorities state without qualification that this country could not now feed itself without a mechanized agriculture. The delivery of increasing quantities of petroleum products to the farms of the nation is posing new problems of distribution and service. Besides gasoline for the tractor and fuel for the home, the petroleum industry is now supplying much of the ammonia fertilizer as well as many insecticides, fungicides, and herbicides needed in the business of farming. Since the production of food is always near the top of any priority list, it may be assumed that the farm trade will continue to be a big item of the business of distributing petroleum products.

DIVISION XIII

MANUFACTURES AND TRANSPORTATION

CONDITIONS IN MANUFACTURING

By L. Seth Schnitman
Consulting Economist

GENERAL

Rarely, if ever in recent years, have so many professional observers of the industrial drama that is America been so chastened by the passing scenes as they were in 1947. Begun in a general setting of predictions of retrenchment, the year closed, as if in defiance, with a blaze of awesome performance records that for years to come may serve to remind us how great are the potentials of the American productive plant and how much more we are capable of producing if only as a people we could learn to solve the production-distribution riddle that still plagued us two full years after war's end.

Large as production was in 1947, it still was short of meeting all demands. As a result, prices continued their upward spiral, and as the year came to an end they threatened not only to get out of hand but worse, also to undermine our entire economic structure. Nor was the problem for us made any the easier by the economic and financial stringencies that had already gripped many other nations of the world, notably England and France.

Time is still on our side but unless we contrive to break the bottlenecks which have brought us to the very brink of a devastating inflation we shall learn the much harder lesson that it takes much more than new highs in production or in employment to produce an enduring basis for a sound economy.

Though a year of triumphs, 1947 was at the same time a year of signal failures. Never before in peacetime were so many goods produced. Yet, never before were we seemingly unable or unwilling to add to plant capacities sufficiently to break the logjams and thus to reduce the groundswell of inflationary forces.

INDEX OF INDUSTRIAL PRODUCTION

Reversing a three-year trend, the combined index of industrial production of the Board of Governors of the Federal Reserve System recorded an advance in 1947 as compared with the previous year's index of the output of factories and mines. At 187, the 1947 index was 10 per cent higher than that for 1946 and 87 per cent above the average for the base period, 1935-1939. During the year of peak physical industrial production (1943), the index was 239 or 139 per cent above the average for the five-year base period, while, in 1941, the last pre-war peacetime year, the index of industrial production was 162, or only 62 per cent above the average of the base period. Thus, it is seen that the 1947 level of production was more than 15 per cent above the volume reported for 1941 when the nation was already a long way on the road to production for national defense and for a war that was forced upon it by the treachery at Pearl Harbor. Still further contrasts are of interest: (1) in 1929, the year that stood as the high-water mark for industrial production until it was exceeded in 1937 the index was only 110 or 10 per cent better than the five-year average; (2) at the nadir of the last great depression (1932), the index stood at 58 or 42 per cent below the average for the period, 1935-1939. Thus, the 1947 index was 70 per cent higher than that for 1929 and almost 225 per cent above the level for 1932.

For manufacturing alone, as distinct from mining, the 1947 production index was 193 or 93 per cent above the level of the base period and contrasts with an index of 177 for 1946; the gain in manufacturing between 1946 and 1947 thus amounted to about 9 per cent. Nonetheless, 1947 showed a volume 25 per cent lower than the reading during the peak year 1943.

For mining, the 1947 index of production, in recording a reading of about 149, established a new high record. The 1947 index was about 11 per cent higher than that for 1946 and exceeded the figure of 1944, the previous record year, by some 6 per cent.

DURABLE MANUFACTURES

Factories producing durable manufactures in the aggregate turned out almost 15 per cent more goods in 1947 than in 1946. Notwithstanding this gain in output, the 1947 index of durable goods production, computed at 220 (1935-1939=100), was almost 40 per cent lower than the index for the peak year of durable goods output (1943). It should be remembered, of course, that in that year many of our factories were at work "around the clock." Had such been the case in 1947, it is not too presumptuous to suggest that most if not all of the bottlenecks encountered in the durable goods industries would have been broken and that one of the principal props of inflation, the excess of demand over supply, would have disappeared. Further pointing up this not too bold presumption is the fact that the 1947 index of durable goods output was not only almost 25 per cent lower than that for 1945, the year when victory was achieved on the battlefields, but also some 27 per cent below the reading for 1942, the first year of actual warfare. Still other comparisons are of moment.

Though more than five times the volume of the depression year (1932), durable goods output in 1947 was only a scant 10 per cent greater than in 1941, when it was still far from certain that as a nation we would be called upon to defend our very existence. Of the elapsed eight years of the 1940s, only three, viz., 1940, 1941, and 1946 recorded lower production indexes for durable goods than was shown for 1947. Simply stated, this can only mean that, however to be achieved, industry must produce even more durable goods if as a people we are to be spared from the enervating effects of inflation. Else industry will be swallowed up by it in the maw of another depression.

NON-DURABLE GOODS

Non-durable goods, too, were produced in larger volume in 1947 than in 1946; the gain was only about 5 per cent as compared with an increase of almost 15 per cent in the production of durables. In attaining a level of about 173, based on the average for the five-year period, 1935-1939, the index of non-durable goods production was within 2 per cent of the peak level reported in 1943. At the same time, the 1947 level of non-durable goods output was some 22 per cent higher than in 1941 and about 2½ times the volume of the depression year (1932). This latter comparison exemplifies the relatively less elastic condition of nondurables as compared with durables, for, it will be recalled, in that year durables production was only about one-fifth of what it was in 1947.

RELATIONSHIP OF DURABLE TO NON-DURABLE MANUFACTURES

Twelve times in the 20 years since 1928, total manufacturing production has exceeded the volume of the previous year. Each time durables and nondurables, alike, contributed to the general advances that were recorded, but there the similarity diverges. Gains in the former, where they occurred, ranged from 13 per cent, as between 1928 and 1929 or between 1936 and 1937, to 45 per cent between 1940 and 1941. Increases in the latter category, *i.e.*, in nondurables, however, ranged from only 3 per cent as between 1933 and 1934 to 24 per cent between 1940 and 1941. The median average increase for those 12 years of rising production was about 30 per cent in the case of durable goods as contrasted with a median of only about 11 per cent for nondurables, a ratio of almost 3-to-1. It is here of as much significance to note that the increase in durables production between 1946 and 1947 was smaller than for each of the other 11 years of gains since 1928, except for 1929 and 1937, and that the 1947 gain in non-durables output was smaller than for any of the years of gains since 1928, barring only 1929. Is this a mere empiricism? Or is it portentous of trouble ahead; is it an harbinger of another 1930 or a 1938, of a depression or a recession? It need not necessarily be, though the maladjustment between the production of durables and output of nondurables, further aggravated in 1947, suggests the possibility of some retrenchment in manufacturing volume as a whole before 1948 has run its full course.

From the ratios between durable and non-durable goods output shown for the respective years in the adjoining table, one may see the relationships between the two which over the years have reflected both abnormal and subnormal conditions in respect to manufacturing activity as a whole. Roughly speaking, when the ratio is 1.00 or unity, as it was in 1939, it means relative balance between the production of durables and the output of nondurables. Such is a generally healthy picture and augurs well for a generally sustained level of manufacturing output as a whole. When the ratio is much above 1.00 as was true for 1947, it means that the rate of non-durable goods production is not high enough, through the processes of trade and exchange, to support for long the rate of output of durable goods. Present conditions, however, are somewhat modified by unprecedented export volume and could be even further thrown out of joint by large-scale assistance to much of the rest of the world under the proposed Marshall Plan, or even by a much enlarged program for national defense, the world situation being what it is.

PRODUCTION INDEXES FOR DURABLE AND NON-DURABLE MANUFACTURES[1]

(1935–1939 Annual Average = 100)

Year	Durable	Non-durable	Ratio: Durable / Non-durable
1919	84	62	1.35
1920	93	60	1.55
1921	53	57	.93
1928	117	85	1.38
1929	132	93	1.42
1930	98	84	1.17
1931	67	79	.85
1932	41	70	.59
1933	54	79	.68

1945	274	166	1.65
1946[2]	192	165	1.16
1947[3]	220	173	1.27

[1] Basic data from Board of Governors of the Federal Reserve System. Ratios for specified years computed by the author.

[2] Revised.

[3] Preliminary.

FOOD PRODUCTS

The index of manufactured foodstuffs output for 1947, at about 157 per cent of the average for the base period (1935-1939), was about 5 per cent higher than for 1946. Not only that, the year's total was greater than for any other year on record. Distressingly, however, it was accompanied by an upward spiraling in prices.

A look at the more important classes of manufactured foodstuffs discloses that, in 1947, wheat flour production was some 11 per cent greater than in the previous year;

that manufactured dairy products as a group exceeded the 1946 production volume by almost 15 per cent; that butter, alone, was produced in 18 per cent larger volume than in the preceding year; that cheese and canned milk showed good gains in output; that total production of meats and meat products was about 15 per cent heavier than in 1946. Other manufactured foods, however, did not fare so well; as a group the gain over 1946 was only nominal. Small gains in confectionery and other manufactured food items barely succeeded in counteracting a loss of some 11 per cent from 1946 in the output of processed fruits and vegetables.

Reflective as much of the surging cost of living as of full employment, retail sales of food at food stores in 1947 reached a new high volume of about $28,000,000,000, besting the volume of the previous year by some 16 per cent.

LIQUOR AND TOBACCO

The output of alcohol beverages as a whole in 1947 was about 4 per cent greater than in the preceding year. Malt liquors, whiskies, and other distilled spirits showed gains ranging from 8 to 30 per cent, to more than counteract a loss in rectified liquors of more than 20 per cent. Consumption of all classes of liquor was somewhat lower than in 1946, thus forcing some reduction in prices.

Tobacco products as a group recorded another new high in production; the over-all gain over 1946 amounted to about 3 per cent. For cigarettes alone, the 1947 production total was more than 5 per cent larger than was recorded in 1946.

TEXTILES, SHOES, APPAREL

The index of production of textiles and textile products barely equaled the level reported for 1946; nonetheless, the 1947 volume was some 63 per cent higher than was shown in the base period, 1935-1939. Textile fabrics, as a group, fell fractionally below the level reported in 1946 but remained some 50 per cent above the average level for the five-year period, 1935-1939. Cotton consumption during the year was off by some 3 per cent from the volume recorded in 1946 but was still some 43 per cent above the level for the base period. Much if not all of the decline in cotton consumption for 1947 may be attributed to the fact that consuming mills generally shortened their production schedules in May and June in reflection of the temporary "drying-up" of demand for goods on the part of large retail distributive outlets which, in trying to resist rising prices, had misjudged the market. In all, cotton textile mills produced close to 11,000,000,000 square yards of fabrics in 1947 of which some 1,500,000,000 square yards found their way into the export markets.

Rayon deliveries to consuming establishments during 1947 registered a new high record. Not only did the year's total exceed the 1946 volume by more than 10 per cent but in doing so it also pushed the index to a level some 170 per cent above the average for the five years, 1935-1939. Weavers of rayon goods produced in excess of 2,000,000,000 yards, for the first time in history. As the year wore on, the higher quality plied yarn fabrics outstripped the cheaper spun rayons. Prices for rayons, relatively soft during the early months of the year, hardened materially, forcing more and more manufacturers to allocate their production, equitably to meet the unsated demands. Buyers who had withdrawn from the market during the first quarter of the year in anticipation of even lower prices, especially for spun rayons which seemed in oversupply, scurried back to push prices to higher levels than ever before.

The hectic demand for rayons left its mark on what was once the great silk manufacturing industry. Weavers of silk fabrics produced not much more than 10,000,000 yards, only a faint shadow of the output totals of, let us say, during the lush 1920s.

Total production of wool textiles, as seen from the index of the Board of Governors of the Federal Reserve System, was almost 5 per cent less than during 1946; notwithstanding, the volume of output was still some 63 per cent higher than during the base period, 1935-1939. In the fabrics field, woolens had much the worst of it, especially during the initial half of 1947 when the market glut had unsettled the price structure, this in striking contrast with the strong and continuing demand for worsteds. The year's output of wool fabrics totaled some 560,000,000 yards, while the mills consumed a bit more than 700,000,000 pounds of scoured wools, a decline from the 1946 volume of about 6 per cent.

Total production of woolen yarns in 1947 showed a loss of virtually 20 per cent as contrasted with the preceding year; worsted yarns, on the other hand, showed an increase in output of some 5 per cent.

Consumption of carpet wools scored an advance over the 1946 volume amounting to almost 35 per cent; the year's total, at the same time, was about 78 per cent higher than the average consumption in the five years, 1935-1939.

Consumption of apparel wools dropped rather precipitately during 1947, the loss from the preceding year's volume amounting to almost 15 per cent; yet the garment industries generally recorded higher dollar volumes than for any other peacetime year. As the year came to a close there was evidence that some manufacturers, especially of men's suits, were certain to be operating to capacity at least through mid-1948. To channel production fairly, allotments were again invoked. Sensing even higher prices, retailers generally accepted the allotment basis of distribution in good grace having at least protected themselves to the extent that their orders were firm as of the date of placement.

The production of leather and leather products considered as a group was about 4 per cent lower than in 1946, though still some 17 per cent above the average output during the five-year period, 1935-1939. The general decline from 1946 was occasioned by a large loss in shoe output and in the tanning of sheep and lamb leathers; the decline in the former amounted to about 11 per cent and in the latter to about 22 per cent. Tanning of other leathers, on the other hand, showed gains over 1946, the most significant occurring with respect to cattle hides, and calf and kip leathers.

PETROLEUM AND REFINERY PRODUCTS

The petroleum industries broke all previous production records in 1947, not excepting the war years. Consumption figures, too, exceeded all earlier records, with the result that the petroleum industry at the close of the year was hard put to meet all demands upon it, domestic and foreign. Crude oil consumption during the year was about one-third higher than in 1941 and about 12 per cent greater than in 1946. Gasoline production was almost 9 per cent greater than in 1946; lubricating oils showed a gain in production over the preceding year of about 11 per cent; kerosene output was about 4 per cent higher; while fuel oil production during 1947 was some 5 per cent greater than in the previous year. The increase in the latter was much too small to meet the demand both for power and heating, as became particularly evident at the year's end. Apropos of the use of fuel oil for heating, it should be indicated that almost 800,000 new oil-burning heating units have been installed since 1945. With the demands of the export markets high, and the needs of the military both for current consumption and stock-piling great, to say nothing of the expanded use of oil for powering American industry, it is small wonder that the pinch in supply was on and that grave concern was voiced over the shortage and means to alleviate it.

PAPER AND PAPER PRODUCTS

The paper and paper products industries scored another advance in 1947 for yet another new high record of production. The index of output, at about 157 per cent of the average for the base period, 1935-1939, was some 9 per cent higher than in 1946. In all, some 21,150,000 tons of paper and paperboard, exclusive of newsprint, were produced under conditions of demand that never wavered during the year. Additions to plant capacities to be completed in 1948 promise to alleviate the tight conditions by making possible a production volume in excess of 22,000,000 tons.

Pulp production during 1947 was about 12 per cent higher than in the previous year. Paperboard output showed a gain of about 9 per cent over the 1946 volume. The production of printing papers, exclusive of newsprint, was almost 14 per cent greater than in the preceding year; fine paper gained by about 2 per cent; but no substantial change from the previous year was shown in the production of either wrapping papers or tissue and absorbent papers.

Newsprint production in 1947 was about 7 per cent larger than in 1946; nonetheless, the index of output was 9 per cent lower than the average for the five years, 1935-1939. On the other hand, thanks to imports, consumption of newsprint during the year was about 14 per cent heavier than in 1946. The printing and publishing industries, as a whole, reported 12 per cent greater activity in 1947 than in 1946.

CHEMICALS AND CHEMICAL PRODUCTS

The index of chemical products production in 1947 was some 5 per cent higher than in 1946. At 250, chemicals production was 150 per cent greater than the average during the base period, 1935-1939. Industrial chemicals production in 1947 was about 9 per cent greater than during the preceding year; rayon output showed a gain of similar proportions; soaps were produced in 14 per cent heavier volume than in 1946; while paints scored an advance of about 4 per cent. Plant expansions in the chemical field continued apace in 1947, bringing the total expenditures since the end of the war for new buildings and equipment to more than $2,000,000,000, chiefly in respect to organic chemicals and synthetic fibers, although it is to be remembered that as yet inorganic chemicals to meet the demands of industry account for almost 70 per cent of current production.

Plastics production during 1947 scaled all earlier records, with a total of about 1,000,000,000 pounds. How far this industry has come can best be indicated by contrast with the year 1929, when only about 55,000,000 pounds of plastics were produced, a volume not large enough to meet today's demands from the automobile industry alone. Vinyls and polystyrene showed the largest relative gains during 1947, paced closely by cellulose plastics and polyethylene. The vinyls find their chief uses in raincoats, shower curtains, and in many other household items; refrigerators, food lockers, and almost countless articles of kitchenware have broadened the uses for polystyrene.

RUBBER GOODS

The output of rubber products showed virtually no change between 1946 and 1947; yet, at 225, the index of production was 125 per cent higher than the average for the five year period, 1935-1939. For the first time since 1943, the consumption of natural rubber by rubber goods manufacturers exceeded the use of synthetics. Out of the year's total consumption of rubber of some 1,110,000 tons, 556,000 tons represented natural rubber. In addition, the industry used about 285,000 tons of reclaimed rubber during the year.

Passenger car tire production in 1947 amounted to about 77,000,000 tires, while truck and bus casings accounted for an additional 17,500,000 units. Altogether, too, some 80,000,000 inner tubes were produced during the year. In dollars, the 1947 production of rubber goods of every description amounted to about $2,750,000,000.

ELECTRIC UTILITIES, EQUIPMENT, AND HOUSEHOLD APPLIANCES

Thanks to high industrial activity, unprecedented employment levels, new highs in appliance sales, and a large volume of new home construction, electric power consumption in 1947 not only exceeded the wartime peak recorded in 1944 but was also some 13 per cent higher than in 1946. Two-thirds of the year's consumption total of about 305,000,000,000 kilowatts was supplied by privately managed companies. During the year, about 2,800,000 kilowatts of new capacity were put in place, so that by the year's end spare capacity was around 8 per cent, in contrast with an anticipated growth in load for 1948 of about 7 per cent. Such a margin, however, is far below the 20 or 25 per cent spare capacity deemed by the industry necessary to cope with any unforeseen contingencies, such as another major strike in the electrical equipment industries. As a result, the power generating industry has scheduled an expenditure of some $1,750,000,000 for new construction and equipment during 1948 on top of the $1,400,000,000 expended during the previous year. In all, generating capacity, both government-owned and privately operated, totaled 65,000,000 kilowatts at the end of 1947, while more than 500,000 additional farms were provided with service for the first time by the ever-expanding belt of power networks.

The year, too, will be remembered by the fact that more household appliances were produced than in any other 12 months in history, ranging all the way from electric toasters and curling irons to radios, refrigerators, television sets, washing machines, and electric ranges. Research, characteristic of the industry over the years, continued apace during 1947. In all, just to illustrate how active was manufacturing activity in the electrical appliance field, some 17,500,000 radio sets were produced during the year, inclusive of television, as compared with only about 15,000,000 in 1946 and a total of 13,000,000 for 1941, when FM sets and "video" were still little more than engineer's blueprints.

RAILROADS AND RAILROAD EQUIPMENT

Never before in peacetime did the railroads of the nation move so much freight as they did in 1947. Sectionally, the western roads bested those of the east and south, both because of the relatively greater expansion in industrial activity and because of so-called longer hauls. Notwithstanding the high traffic volume enjoyed by the industry as a whole, the railroads, of all our major industries, financially fared the worst, and this despite the fact that they were awarded what in more ordinary times would have been considered substantial rate increases. Mounting costs, both for materials they buy and for wages and salaries they had to pay, thus had much the better in the tug-of-war between costs and prices that characterized all industry to some degree or another during the year.

Despite substantial declines in earnings, in part alleviated by the freight rate increase that, on an overall basis, averaged about 17½ per cent and some upward adjustments in passenger rates, the railroads continued to add materially to their rolling stock during the year in their attempts not only to modernize their lines to improve efficiency and cut unit costs but also to reduce the incidences of equipment shortages, particularly with respect to freight cars and locomotives. Some 800 new locomotives were installed during the year, of which more than 700 were diesels, while at the year's end an additional 1,200 locomotives were still on order with the locomotive builders. After lagging during the initial half of the year, deliveries of new freight cars to the railroads as the year closed was at an annual rate of better than 100,000, with unfilled orders suggesting that, barring strikes in major supplying industries, monthly deliveries of freight cars sometime during the first half of 1948 would reach a total of 10,000 units.

IRON AND STEEL

In boomerang fashion, the strikes during 1946 in the steel and the feeder industries, returned to plague our entire economy in 1947; that is to say, the lost ingot production of that hectic year of 1946, could it have somehow been found, would have more than spelled the difference between the relative famine that was and the plenty that might have been in 1947, and at prices that were fair to all comers.

Unparalleled demands from industry brought with it a steel production in 1947 of about 85,000,000 net tons of ingots and castings, for a volume never before reached in peacetime. Measured by the index of the Board of Governors of the Federal Reserve System, the 1947 output of all steel and steel products scored an advance of some 31 per cent over the total of 1946; open hearth steels increased by about 27 per cent while electric steels scored a gain of some 45 per cent.

NON-FERROUS METALS

As a group, non-ferrous metals production was some 19 per cent greater in 1947 than in the preceding year. Despite this large advance, the index was still some 9 per cent lower than that shown for 1945; notwithstanding, the 1947 level of output was about 86 per cent higher than the average for the five-year base period, 1935-1939. Smelters and refiners, and fabricators, too, participated in 1947 in the general advance in production that was scored over the level of the previous year. As was to be expected, of all major non-ferrous metals used in industry, aluminum production in 1947 showed the best relative performance. For the first time since 1944, primary aluminum output was in excess of 1,000,000,000 pounds, a volume apparently still too small to meet all demands, judging from the backlog of orders yet unfilled at the year's end.

AUTOMOBILES

Some 5,000,000 motor vehicles were produced in 1947, of which about 3,500,000 were passenger cars. Though demand for new cars continued unabated, the year's production volume was still far behind the volume of previous peacetime peak years, chiefly because of steel shortages; yet, in all but the so-called lowest price brackets, it was becoming apparent that assemblies of new cars, as 1947 came to a close, were getting much closer to true demands than at any time since the end of the war. Meanwhile, used car prices, particularly for models antedating 1947, seem to suggest that the time is not too far off now when new car deliveries, even of the lower-priced models, will be much more on a current basis than is presently the case.

MACHINERY AND EQUIPMENT

The index of production of machinery for 1947 was about 15 per cent higher than that recorded for the previous year. Machine tools output, alone, aggregating about $300,000,000 in 1947, though good, was much smaller than it otherwise might have been but for the bottlenecks and shortages that impeded plant modernizations and expansions.

Office equipment manufacturers enjoyed their best year in our peacetime history, helped as much by high demands at home as by unprecedentedly high demands of export markets. As was to be expected from the peak level of farm income, manufacturers of farm equipment in 1947 produced and sold more goods than ever before in their history.

BUILDING MATERIALS

Lumber output in 1947 was about 8 per cent larger than in the preceding year. In recording an index of 143, the 1947 volume was 43 per cent greater than the average for the five years, 1935-1939; yet, it was only in the final quarter of the year that supplies of most species of building lumber were available in quantities sufficient to meet current demands. Even so, millwork items, notably stock doors and windows, continued in tight supply, giving many headaches to home-builders who had not laid in their supplies.

Stone, clay, and glass products as a group showed a production index in 1947 of 206, for a gain over the preceding year of about 8 per cent and for an increase over the average for the base period of 106 per cent; cement production, alone, scored an advance over the previous year's total of almost 14 per cent without materially alleviating the shortage condition; clay products, chiefly bricks, showed a gain in production over the volume of the previous year amounting to almost 10 per cent. The output of gypsum and plaster products was at an all-time high for 1947, yet as the year ended supplies were still rather tight. But for these and other bottlenecks, notably in nails, cast-iron soil pipe, and certain sizes of galvanized pipe, the 1947 construction record, particularly in the housing field might have been more eloquent.

CONCLUSION

More eloquent, too, might have been the entire economic record of 1947, had government, industry, and labor succeeded in finding the common denominator for a successful war against our most vicious enemy, inflation. Calling the kettle black could not do it; costly investigations and Congressional entourages could not do it; well-meaning or high-sounding mouthings of industrial leaders and of high-ups in the ranks of organized labor could not do it. No, not alone. Perhaps conditions were not yet bad enough to move them to collective action. Bad or not so bad, 1948 must produce the climate for decisive action or our entire economy will suffer one of its worst setbacks in recent times.

THE UNITED STATES TARIFF COMMISSION

By Oscar B. Ryder
Chairman, The United States Tariff Commission

Commissioners

Oscar B. Ryder, Chairman	E. Dana Durand
Lynn R. Edminster, Vice Chairman	George McGill
Edgar B. Brossard	John P. Gregg

Sidney Morgan, Secretary

New York Office—Room 513 Custom House
Samuel W. Pitts, In Charge

FUNCTIONS AND ACTIVITIES

The United States Tariff Commission, an independent executive agency of the United States Government, was created by Act of Congress of Sept. 8, 1916, as a nonpartisan investigating and fact-finding body to assist the President and the Congress in matters pertaining to tariff and to foreign commercial policy.

The present laws that prescribe the function of the Tariff Commission are the Tariff Act of 1930 as amended (sections 330-341); section 350, the Trade Agreements Act; section 22 of the Agricultural Adjustment Act as amended, and section 504 (d) of the Philippine Trade Act of 1946; and Executive Order 9832 of Feb. 25, 1947.

Beginning in the fall of 1939, the Commission directed its activities largely to immediate war problems and to giving assistance to defense agencies. As war agencies succeeded defense agencies, the cooperative activities of the Commission increased, and every possible assistance was given to those charged with handling the economic phases of the prosecution of the war. Throughout the war the Commission continued its assistance to war agencies.

RETURN TO PEACETIME ACTIVITIES

During 1947 the work of the United States Tariff Commission has been marked by the almost complete cessation of special activities related to the Second World War and the return on a full-time basis to normal peacetime activities related to the tariff and foreign trade. Many international trade problems which confronted the nation during the year had existed, at least in some degree, before the war. As a result of the war, however, most of these problems were aggravated; in addition, others were newly created.

In 1947 the work of the United States Tariff Commission was much affected by the important changes in the world economic scene, and by the efforts of the Administration to bring about such adjustments in the international trade policy of this country and other countries as would help to meet the difficult post-war conditions.

TRADE AGREEMENTS MEETING AT GENEVA

Much of that work has been concerned with requests for information by the Congress, its committees, and members on various aspects of the current international trade situation and with the duties assigned to the Commission by the Trade Agreements Act and Executive orders thereunder. During the early months of 1947 the Commission continued the work, begun in 1946, of preparing materials for the multilateral trade agreement negotiations held at Geneva, Switzerland, beginning in the spring of 1947; it also assisted the Committee for Reciprocity Information by digesting the briefs submitted to it and the oral testimony presented at the public hearings held in Washington before the Geneva negotiations began.

INTERNATIONAL TRADE ORGANIZATION CHARTER

At the request of the House Committee on Ways and Means, the Commission analyzed all the articles in the London draft of the proposed International Trade Organization charter. At the request of the House Committee on Agriculture the Commission also made an over-all analysis of the effects which adoption of the proposed ITO charter would have on the agricultural program of the United States. Later an analysis was made of the Geneva draft of the proposed charter.

The Commission assisted the Senate Committee on Finance during its hearings on the trade agreements program and the proposed ITO charter. The Chairman of the Commission testified before the Committee; the Commission also assigned personnel to assist individual members of the Committee, and prepared various memorandums and information for incorporation in its record. When, in May 1947, the House Ways and Means Committee held hearings on the administration of the trade agreements program and the formation of the ITO, the Tariff Commission assisted the Committee by supplying it with numerous Commission reports and memorandums previously prepared, by furnishing special memorandums requested by members of the Committee, and by assigning members of its staff to aid both the majority and the minority members of the Committee.

UN CONFERENCE ON TRADE AND EMPLOYMENT

Twenty-seven members of the Commission's personnel, including five members of the Commission, served in various capacities in the work of the United States Delegation to the Second Meeting of the Preparatory Committee of the United Nations

Conference on Trade and Employment, which was held at Geneva from April through October 1947, and which dealt both with the ITO charter and with the multilateral trade agreement. While the Conference was in session, members of the Commission's staff in Washington provided much technical and statistical information for the United States delegation in Geneva.

SUMMARIES OF TARIFF INFORMATION

The Commission spent considerable time in 1947 doing the necessary preparatory work for revising and bringing up to date the Summaries of Tariff Information, as requested in a resolution of the Committee on Ways and Means adopted in July 1947. These summaries became its principal work in the ensuing few months. It has also laid plans for carrying out the other requests contained in that resolution, namely, to rewrite and otherwise bring up to date the Dictionary of Tariff Information; to keep currently informed and to report immediately to the Committee on Ways and Means regarding rates of duty which appear to be so low as to give imports a substantial advantage over domestically produced commodities or so high as to exclude from the domestic market reasonable competition from imports; and to establish and report to the committee the substantive and procedural criteria by which, in the administration of the "escape clause" in trade agreements, it will determine whether imports of a particular commodity are entering in such quantities as to injure or threaten injury to any domestic unit of agriculture, labor or industry.

MARSHALL PLAN REQUIREMENTS

In response to the request of the House Select Committee on Foreign Aid, the Commission, together with other agencies of the United States Government, worked on a study of probable requirements of the countries under the Marshall Plan for specific products, and the potential sources of supply for any deficits of these countries as a group. The Tariff Commission's part of the study involved approximately 40 products.

OPERATION OF TRADE AGREEMENTS ACT

During 1947, the duties of the Tariff Commission in the operation of the trade agreements program were expanded. This expansion is likely to have much more effect on the actual work of the Commission in future years than it did in 1947. Under Executive Order 9832, certain existing trade agreement procedures were formalized and made mandatory; in addition, two important functions in the administration of the Trade Agreements Act were formally delegated to the Tariff Commission. The Executive order required that each future trade agreement contain a clause safeguarding United States producers against serious injury resulting from trade agreement concessions and made the Tariff Commission responsible for investigating complaints as to any injury or threat of injury and for reporting to the President with recommendations in appropriate cases. The Executive Order, in addition to specifically setting forth the Commission's already recognized function of supplying the interdepartmental trade agreements organization with information on imports into the United States, required that the Commission make an annual report to the President and the Congress on the operation of the trade agreements program.

OTHER ACTIVITIES OF THE TARIFF COMMISSION

Other work of the Tariff Commission during 1947 included the completion of investigations, with respect to quotas on short harsh cotton and on long staple cotton, conducted under the provisions of section 22 of the Agricultural Adjustment Act, as amended; the publication of reports on Burlap, China Clay, Cotton Cloth, Grapes and Grape Products, Mica, Newsprint, and Softwood Lumber in the series on War Changes in Industry

(20 reports had previously been issued in this series); the completion of seven reports in the series on trade problems of the American republics, making 45 that have been issued to date in the series; and the issuance of the annual and monthly data on United States production and sales of synthetic organic chemicals. Work on certain important projects of the Commission, such as the Review of Customs Administrative Laws and the Report on the Effect of the War on the General Foreign Trade Position of the United States, had to be deferred during 1947 because of the limitation on the size of the Commission's staff and its occupation with other urgent work.

As international situations and problems shift from year to year, the work of the Commission varies. As previously stated, the fundamental purpose of the Commission's activity is to furnish information regarding tariff and trade matters to the President, the Congress, and other government officials responsible for the determination of United States commercial policy.

ADMINISTRATION OF THE TARIFF LAWS

By C. A. FREEMAN

DIVISION OF FISCAL ADMINISTRATION, BUREAU OF CUSTOMS,
TREASURY DEPARTMENT

GENERAL

Hampered by lack of raw materials, dogged by delays in the conclusion of peace terms, with staggering reparation claims facing the Nazi satellites, and with wasted fields and factories unrestored in Nazi-occupied areas, world trade, nevertheless, showed continued improvement during the fiscal year ended June 30, 1947. The value of imported commodities released for consumption reached an all-time high of $5,386,956,000, exceeding by $148,335,000 the previous record registered in 1920. Thus did the remainder of the world attempt to build up its purchasing power to secure in this country the goods so greatly needed for the reconstruction and restoration of its economy.

CUSTOMS COLLECTIONS

Following the generally upward trend maintained through the last year of the war and the first post-war year, customs collections continued to rise during the first seven months of the fiscal year ended June 30, 1947. Despite the decline after January, total collections for the year ($497,533,914) reached the highest level attained since the passage of the Tariff Act on June 17, 1930, and were exceeded in customs history only during the eight years immediately preceding the passage of that act.

Increased collections were received from all types of entries except those involving withdrawals from bonded warehouses, the sharpest rise being in the case of mail entries and baggage entries which reflected respectively the continued growth in the volume of tourist travel and the continued flood of commercial importations by mail. The slight recession in the case of warehouse withdrawals resulted from lessened consumption of unmanufactured wool and distilled liquors which are two of the commodities most frequently warehoused.

COMMODITY REVENUE TREND

Most of the commodity groups provided in the Tariff Act showed an increased volume in importations which resulted in substantial increases in customs revenue. Decreases occurred in only four groups. Raw wool which yielded $150,045,369 in revenue in 1946 declined to $121,105,594 during 1947, and except for the peak reached during the previous year this represented a larger amount received from imports of this commodity than in any previous year in customs history. Imports of distilled spirits and other beverages continued to decline for the third successive year from the all-time of 1944 when domestic stocks were depleted because of war restrictions.

Sugar which was largely imported free of duty by the Commodity Credit Corporation during the two years preceding Jan. 1, 1947 was again restored to a dutiable status and as a result yielded more than four times the revenue realized in 1946. The admission of most of the lumber importations free of duty after Oct. 25, 1946, as an emergency measure to aid the reconversion program, resulted in diminished revenue from the wood and manufactures schedule.

A study recently made in the Bureau of Customs, shows some significant trends in the types of duties used for the collection of revenue. Three types are provided in our tariff: specific, based on a specified rate per pound, bushel or yard; ad valorem, based on a specified percentage of the value; and compound, a combination of the other two types. In a general way, specific rates are applied to raw materials and to manufactured articles which can be easily weighed or measured, such as sugar and distilled spirits, while ad valorem and compound rates are applied to manufactured goods, especially to those which are subject to wide variations in value. This study discloses a sharp decline in the last ten years in the average ad valorem equivalent (ratio of duty to value) for all three types of duties, owing partly to the effect of the Trade Agreement program, intensified in the case of goods dutiable at specific rates by recent inflationary tendencies and partly by changes in the type of goods imported. The blackout imposed by the war on shipments of manufactured goods from Europe is shown in the shrinking in the percentage of total duties levied at ad valorem or compound ratio from more than one-third of the total in 1938 to a mere one-eighth of the total in 1944. With the return to more nearly normal conditions, such duties represented 30 per cent of the total collected in 1947.

REVENUE TREND BY COUNTRIES

Imports from Europe continued to increase so that for the second successive year this area was the most important continental source of customs revenue. Among the individual countries, however, a very different condition existed. Australia, with its large shipments of high grade raw wool, continued to be the most important source of customs receipts. Cuba, with sugar again dutiable, ranked second and Canada third, with

MERCHANDISE ENTRIES

	Number of Entries		Duties Collected		Percent of Increase or Decrease (—)	
	1946	1947	1946	1947	No. Entries	Duties
Consumption entries	426,434	497,019	254,024,733	304,260,165	16.6	19.7

the United Kingdom, Switzerland, Argentina, and Mexico following in the order named. With lessened demand for the lower grade wools from South America, sharp declines took place in the customs revenue realized on imports from Argentina and Uruguay, the chief sources of such wool, while the fine grade wools of Australia, New Zealand, and the Union of South Africa yielded revenues little different from those in 1946. Most of the European countries showed sharp increases in duty yield, declines appearing only in the case of Switzerland which restricted its exports of watch movements to this country, in Spain and Portugal, which are returning to their more normal trade with the United States after the lush years when the rest of Europe was blacked out, and in Germany whose shipments of hops to the United States in 1946 were not equaled during the past year.

DUTY REFUNDS

Some duties are collected in excess of the amounts subsequently found to be due. The refund of such excessive duties amounted to $6,081,925 in 1947 and $4,089,176 in the previous year. Another type of refund designated as a drawback is provided after exportation under proper safeguard of merchandise previously imported. Such drawbacks aggregated $10,583,023 in 1947 and $6,638,500 in 1946. More than 99 per cent of the drawback yielded was on merchandise manufactured from imported materials. Among the more important of these in 1946 were sugar, wool, coal tar products, crude petroleum, unmanufactured tobacco, copper, and several of the other metals.

ENTRIES OF MERCHANDISE

Reflecting the upward trend in the volume of customs business, the number of entries of merchandise continued to increase for the fourth successive year. This increase appeared in all types of entries, the sharpest being in the mail entries, which indicated the resumption of commercial shipments by mail. The very small increase in the number of baggage entries followed an unusually large increase in 1946 and indicated that tourist travel was maintained at the high level of the year before.

INTERNATIONAL TRAFFIC

For the sixth consecutive year, border traffic increased. Almost 15,-

VALUES OF DUTIABLE AND TAXABLE IMPORTS FOR CONSUMPTION AND ESTIMATED DUTIES AND TAXES COLLECTED BY TARIFF SCHEDULES

(Fiscal Year 1946 and 1947)

Tariff Schedule	Value		Estimated Duties and Import Taxes[1]		Percentage Increase or Decrease (−)

000,000 automobiles and buses entered the United States from contiguous countries during 1947, carrying more than 47,000,000 passengers. With the continued increase in automobile traffic, however, the number of passengers arriving by train again declined. Vessel and aircraft arrivals were more numerous, but with the return of much of the overseas service personnel, the number of passengers arriving both by air and by sea was smaller than in 1946.

LAW ENFORCEMENT

Slightly fewer seizures were made in 1947 than during the preceding year, but their value was almost double that of 1946. The heavy tourist travel resulted in substantial seizures of cameras, furs, jewelry, watches, and wearing apparel, items which tourists are prone to attempt to smuggle. As an economy measure, the border patrol service along the Canadian border was discontinued and the personnel who wished to remain in the Customs Service were given other assignments. The Mexican border patrol, however, was continued in operation, since smuggling in this area, particularly of marihuana and other narcotics, continued to be a matter of concern to enforcement officers.

RAILROADS

By W. T. Faricy
President, Association of American Railroads

GENERAL

Again in 1947, as in prior years, the great bulk of the nation's transportation requirements was handled by its system of privately owned and operated steam railroads. Notwithstanding a limited supply of freight cars and other equipment, a situation over which the railroads have had little or no control in the past six years, the transportation needs of manufacturing, agricultural, mining, and general business activities were well served by the rail carriers in 1947. While complete figures for 1947 are not yet in hand, it seems probable that the railroads transported more tons of freight than ever before, even surpassing the wartime high of 1944. The ton-miles of service performed, although below the record wartime years because of the return of average hauls per ton to more nearly normal levels, far exceeded those of any previous peacetime year.

The sustained high level of general business activity in the United States, which began in the latter part of 1946 and continued throughout 1947, was accompanied by inflationary trends in the nation's price structure. Further wage increases, on top of the substantial ones granted in 1946, made it necessary for industry generally to raise prices in order to maintain a balance between income and outgo. The railroad industry, albeit unwillingly, was swept along with the spiraling tide of increasing costs and prices.

Since 1939 railroad annual operating costs have been increased by about $3,250,000,000 as a result of increases in employee wage rates, in unit prices of fuel, materials, and supplies, and in payroll tax rates. To offset this over-all increase of 76 per cent in unit costs, the railroads have sought authority to increase freight rates, passenger fares, and mail pay on the average by about 48 per cent. Some of the increases sought were authorized by the Interstate Commerce Commission in decisions handed down during 1947; others were still pending at the end of the year.

While most other industries are free to adjust their price structures promptly to meet new operating costs, the regulated railroad industry must go through the tedious, and sometimes lengthy, procedure of public approval, as determined by Federal and state regulatory commissions. While the Interstate Commerce Commission worked diligently in 1947 to pass upon railroad petitions for increased rates and fares, the lapse of time between the impact of new costs and the effective dates of rate and fare increases was costly to the railroads. As a result, railroad net earnings in 1947 represented a rate of return on net investment (after deducting accrued depreciation) of only about 3⅓ per cent. This comparatively low rate of return in a year of very high traffic volume indicates the effect of sharply rising costs and delayed rate and fare increases.

Deliveries of new freight and passenger cars and new locomotives in 1947 were disappointing. During the war years, the construction of new railroad equipment was necessarily restricted because of shortages in steel and other critical war materials. This situation, together with the hard usage to which railroad facilities were put during the war, built up a considerable need for new railroad equipment at the end of the war. The heavy volume of traffic handled by the railroads in the post-war period to date further emphasized this need. However, from Sept. 1, 1945 to Nov. 30, 1947, Class I railroads obtained deliveries on only 105,930 new freight cars, while retiring 149,202 old cars from service, and installed only 1,549 new locomotives, while retiring 4,418 old ones. At the end of November 1947, there were 125,395 freight cars, 1,180 locomotives, and 2,672 passenger train cars on order. Some improvement in the rate of monthly deliveries took place in the late months of 1947, and it is expected that 1948 will witness further improvement in the delivery of this badly needed new equipment.

FREIGHT TRAFFIC VOLUME

All railroad statistics hereinafter given apply to the Class I group, or those railroads with annual operating revenues of $1,000,000 or more. Such companies operate about 95 per cent of the total railway mileage of the United States and earn approximately 97 per cent of the total revenues.

Railroads originated approximately 1,500,000,000 tons of freight in 1947, about 10 per cent more than were originated in 1946 and fractionally higher than in the peak war year of 1944. The bulk commodities, such as coal, coke, iron ore, and grain, were primarily responsible for what now appears likely to be a new all-time record in railroad freight tonnage, though manufactured products also moved in considerable volume. Reductions below 1946 were recorded in livestock and L.C.L. movements, probably the result of increased motor truck operations. An all-time record wheat crop, the foreign aid program, and the comparatively few work stoppages in industry due to labor disputes, were the outstanding factors which brought about the record freight tonnage handled by the railroads in 1947.

Ton-miles of freight handled in 1947 approximated 647,000,000,000, an increase of between 9 and 10 per cent over 1946, but 12 per cent below the 1944 peak. The long hauls of war goods to the ports, particularly to the West Coast ports, raised the average haul of all freight by more than 120 miles during the war period. Since the end of the war, the average haul per ton of freight has declined, but in 1947 it was still greater than in prewar years by about 60 miles, or 18 per cent. Ton-miles in 1947 were greater than in 1946 in every month of the year except July. In that month, coal production was considerably reduced while the new labor contract was being negotiated.

PASSENGER TRAFFIC VOLUME

Passenger traffic continued its postwar decline in 1947. Following January 1946, each of the remaining 11 months of that year and each of the 12 months of 1947 showed decreases below the corresponding month of the preceding year, a total of 23 consecutive months of decline. A halt in this downward trend is not yet in sight. It was to be expected, of course, that railroad passenger traffic would fall considerably from the very high volume attained during the war period. That decline in 1947 was about 53 per cent below the 1944 peak —45,000,000,000 passenger-miles in 1947 compared with 95,500,000,000 in 1944. Compared with 1946, the decline in 1947 passenger-miles was about 31 per cent.

In Table I, statistics of tons of freight originated, ton-miles, and passenger-miles for the year 1947 and for earlier years are shown. The entries for 1947 are necessarily partially estimated, as complete figures for the

TABLE I

RAILROAD TRAFFIC

Year	Tons Originated (000,000)	Revenue Ton-Miles (000,000)	Revenue Passenger-Miles (000,000)
1920	1,255	410,306	46,849
1929	1,339	447,322	31,074
1939	902	333,438	22,651
1940	1,009	373,353	23,762
1941	1,228	475,072	29,350
1942	1,421	637,984	53,659
1943	1,481	727,075	87,820
1944	1,491	737,246	95,549
1945	1,425	681,001	91,717
1946	1,367	591,982	64,673
1947*	1,500	647,359	44,790

* Partially estimated.

year were not available at the time this was written.

In reviewing the traffic statistics given in Table I, it is of interest to note the railroad estimates of ton-miles and passenger-miles for the year 1948, submitted at final hearings on the application for increased freight rates (Ex Parte No. 166) in December, 1947. Those estimates were 630,000,000,000 revenue ton-miles and 39,000,000,000 passenger-miles for 1948; respective declines below 1947 of 3 per cent and 13 per cent.

WAGE RATES

The considerable increases in railroad freight and passenger traffic in the post-war period over the pre-war period, as shown in Table I, would have produced, other things equal, materially higher net earnings. However, unit operating costs since 1939 have increased at an alarming rate, with the result that the benefits of the greater traffic volume have been largely dissipated.

General wage increases were granted railroad employees in 1941, again in 1943, and twice in 1946. These increases, together with the payroll taxes thereon, added about $1,500,000,000 to the annual operating costs of the railroads, based on 1946 operations. In addition, vacations with pay granted to employees added another $75,000,000 to the annual payroll. Further demands for wage increases and changes in working rules were made in 1947.

The non-operating group of railroad employees, represented by 17 unions and covering about 1,000,000 employees, were the first to file demands in 1947, asking in March for a wage increase of 20 cents per hour. This dispute was finally settled by arbitration, under provisions of the Railway Labor Act. The Board of Arbitration, consisting of two railroad representatives, two employee representatives, and two neutrals agreed upon by the parties, handed down its decision Sept. 2, 1947, awarding an increase of 15½ cents per hour to the employee groups involved, effective Sept. 1. The two railroad members of the Board dissented from the decision. This award added $467,400,000 to annual railroad operating costs.

The operating group of employees, represented by five unions and covering about 350,000 railroad workers, filed demands in April 1947 for reconsideration of far-reaching changes in working rules. These same proposals, which involve well over $1,000,000,000 of additional annual costs to the railroads, had been submitted about two years earlier and were disposed of in May 1946 by granting an additional wage increase of 2½ cents per hour. In September 1947, the operating groups also filed demands for wage increases amounting to 30 per cent, with a minimum money increase of $3 in basic daily rates.
